AFGHANISTAN.

THE anxiety which was felt while communication with Cabul was interrupted has been happily dissipated by the news of General ROBERTS's brilliant victory. There had been little reason to fear that his cantonments could be stormed; but the report that heavy firing had been heard for forty-eight hours seemed to indicate a serious contest. It now appears that Sir F. ROBERTS had not been too sanguine when he spoke, soon after his retreat to Sherpur, of his intention to resume the offensive. His own force was, as he intimated, sufficient for the purpose, though he wished to postpone the attack till General CHARLES GOUGH had brought up reinforcements from Jellalabad and Latabund. The enemy fortunately provided him with an unexpected opportunity. It was probably in anticipation of General GOUGH's arrival that a determined assault was made in great force on the most vulnerable point of the position. Having been forewarned of the intended movement, Sir F. ROBERTS was not content with the mere defence of the camp. His cavalry and artillery were sent out to attack the enemy in flank and in rear, and the Afghans fled in wild confusion. A snow storm prevented immediate pursuit; but on the following day it was found that the defeated army had evacuated the city and the Bala Hissar; and probably large numbers have disbanded and returned to their homes. When the battle, in which Sir HUGH GOUGH took a principal part, was in progress, General CHARLES GOUGH's camp had already been seen at a distance of six miles. Sir F. ROBERTS is now more completely master of Cabul than before he left it, and there is consequently no danger that the troops will be in want of provisions. The principal advantage of holding a large town is that the inhabitants must be fed from sources which are equally accessible to the occupying army. MOHAMMED JAN, who has escaped, will probably have forfeited the confidence of troops by whom he had been regarded as a general able to match himself with the English. General ROBERTS's confidence in his present position is proved by his detachment of a strong column in the direction of Kohistan. It is satisfactory to learn that the ladies who had taken a leading part in the insurrection are now in courteous custody. No moral blame can attach to them for their attempts to avenge the deposition of a son-in-law and a husband; but it will probably be thought advisable that they should retire to India for a time. If it is true that YAKOOB KHAN signed an order for the death of CAVAGNARI, he will have to bear the consequences of an unpardonable crime.

It is to be wished rather than to be hoped that patriotic gratification in the triumph of the English arms may prevail over disappointment at the failure of predictions. Monday's papers, in which the welcome news from Cabul was published, also contained a proclamation by that wonderful Peace Society which, while it denounces war in general, always proves that the war for the time is exceptionally criminal. The author of the document incidentally remarked that the disastrous course of the war corresponded to its guilty origin. He has since learned that fortune is not chained to the chariot wheels of the virtuous and unoffending Afghan. There is something more ludicrous in the failure of specific prophecies of evil proceeding from an infallible oracle. The same writers who incessantly preach the semi-divine attributes of their favourite statesman or demagogue are masters of military science as of sacred and profane knowledge. Only a fortnight ago they dogmatically announced that in three weeks from that time Sir F. ROBERTS would have to fight his way through the passes to Jellalabad with two thousand English soldiers who were graciously allowed to be in good condition, and four thousand natives all but disabled by cold and disease. That the movement by the Jellalabad road would be effected by other troops, and in the opposite direction, was not even thought of as possible. It now appears that Sir F. ROBERTS and the VICEROY himself know their own business better than the dogmatical amateurs who had resolved that the English army should be defeated. There is reason to hope that the Afghan malcontents are so far subdued that they will not again attempt a hostile combination on a large scale. Some of the tribes will continue to attempt the interception of convoys; and it may probably be necessary to take and occupy Ghuznee. Some symptoms of disaffection have for the first time appeared at Candahar. On the other hand, AYUB KHAN, who, it seems, is still nominal Governor of Herat, has sent agents to negotiate with the English generals. The political difficulties which must sooner or later be dealt with may be conveniently adjourned. The present task of the Indian Government is to suppress resistance from one end of the country to the other, as a preliminary to some arrangement by which the Afghans may be effectually and permanently controlled. It is in the highest degree inexpedient to inform them that, if they will only wait, they will be left to themselves. After feeling the heavy hand of the Power which their late ruler defied, they will perhaps be in a more docile mood than after the massacre of 1841, or the evacuation of the country in the following year.

There can be little doubt that the exploits of Sir F. ROBERTS and the policy of the Government have greatly strengthened the hold of England on India. Mr. GLADSTONE, indeed, contended that the native princes and the subjects of the Empire would be dissatisfied with increased military expenditure, with restrictions imposed on the vernacular press, and, above all, with the supervision exercised over the importation of arms. Unfortunately for the soundness of his conclusions, Hindoos and Asiatic Mahomedans are not English Radicals. They respect and obey a Government which is sufficiently strong and courageous to defend itself against attack. A villager despises authorities who allow local agitators to publish treason with impunity; and he would be incapable of understanding the suggestion that the armament of possible enemies with improved weapons ought to be permitted or encouraged. Mr. GLADSTONE suggested that rifles and revolvers were imported for the singular purpose of killing snakes; and he seemed to attribute to the law for restraining the importation of arms the great though diminished mortality from the bites of venomous reptiles. Although he once stated that his Cabinet always avoided, if possible, any consideration of Indian affairs, he must have heard when he was in office that there were Indian princes with armies collectively larger than those of the Supreme Government; and even a candidate for Midlothian can scarcely wish that additional facilities should be given for future rebellion and civil war. Not only the great feudatories, but

the mass of the people, will be more loyal to a Government which will tolerate neither insurrection nor turbulence encouraged by a rival Power.

A letter by an Indian Correspondent of the *Times*, written before the victory at Sherpur was reported, goes far, if the writer is well informed, to justify the reversal by Lord BEACONSFIELD and his colleagues of the policy of their predecessors. It appears that the constant aggressions and menaces of Russia had produced a belief in the comparative decline of English power; and the impression could not but be confirmed by the official affectation of indifference to Russian encroachments and intrigues. The rebuff which SHERE ALI received from the Duke of ARGYLL was probably, with its necessary results, better understood by native Indian politicians than by the English Cabinet. The complacent acquiescence of successive Viceroys in the correspondence between the AMEER and General KAUFMANN was universally, and perhaps not altogether unjustly, attributed to fear. Asiatics, and not Asiatics only, habitually incline to the stronger party; and anxious professions of confidence in Russian moderation were, not without some reason, interpreted as indications of conscious weakness. It is now believed that India is, as a whole, not only loyal, but enthusiastically devoted to the English Government. The *Times*' Correspondent dates the reaction from the despatch of the native troops to Malta, a measure in which Mr. GLADSTONE has never been able to see anything except a quibble about a clause in the Bill of Rights. The peremptory refusal of the VICEROY, under the instructions of the Home Government, to submit to the exclusive presence of a Russian Mission at Cabul, confirmed the novel faith in English spirit and resolution. It is not improbable that Mahomedans in some parts of India may have wished well to the Afghans in their resistance to the English army; but those of them who know anything of politics are aware that the only question in Afghanistan was whether England or Russia should be the paramount Power. Even Mr. GLADSTONE ought to approve of a change in native feeling which may probably render the government of India cheaper as well as more durable.

SIR HENRY LAYARD AND THE PORTE.

THE Porte and Sir HENRY LAYARD have between them enacted a little comedy to welcome the New Year. Diplomatic relations between the two have been suspended for a few hours. Every care, however, has been taken to make the process as little unpleasant as possible. The convenient distinction between official and semi-official intercourse has proved of great service, and though Sir HENRY LAYARD no longer knows officially that such a Government as the Porte exists, he has remained in constant communication with it semi-officially. It is as well perhaps that the Porte should not have got entirely rid of him by the suspension of official relations, since had it done so the inducement to keep up the coolness might have been irresistible. For some months back Sir HENRY LAYARD has had to play the part with which English Ambassadors at Constantinople were formerly so familiar. He has had to preach to the Porte the duty of consulting its own interests. The Porte is not exceptionally destitute of self-regarding instincts, and if it could agree with Sir HENRY LAYARD as to what its interests are, it would listen willingly enough to sermons which would then be superfluous. Unfortunately its reading of its interests is quite different from Sir HENRY LAYARD'S. The doctrine now in favour at Constantinople is that a short life and a merry one is decidedly preferable to a life which would certainly not be merry, and might after all not be long. It is in vain that Sir HENRY LAYARD enlarges on the beauty of reformation and the rich rewards of a good conscience. Virtue will not fill the SULTAN'S treasury or his servants' pockets; and as this is the one difficulty which really troubles the Turkish Government, Sir HENRY LAYARD'S advice naturally strikes them as inappropriate. Exhortations to which you do not mean to attend and advice which you do not mean to take soon become wearisome; and if a suspension of diplomatic relations were really tantamount to deliverance from them, the Porte might be tempted to try the experiment of leaving these relations suspended. But if all that comes of the change is that Sir HENRY LAYARD'S sermons are delivered in plain clothes, there is no actual gain to set against possible loss. The Ambassador speaking unofficially is just as unpleasant as the Ambassador speaking officially, while the fact that he no longer speaks officially may draw an inconvenient amount of attention to some points of Turkish administration which the Porte would rather leave in modest obscurity.

The cause of this formal coolness between Sir HENRY LAYARD and the Porte is one of the many phases of the missionary question. The Powers which met in conference at Berlin showed an unselfish desire for the extension of religious toleration beyond their own dominions. As religious liberty is not very well understood in Russia or Germany, and is not quite free from danger in France, it was thought expedient to keep it constantly on view in South-Eastern Europe. When, however, toleration has to be practised as well as preached, unforeseen difficulties are apt to arise. The class of Turks who rise high in the public service are seldom disposed to be bigots. Provided that they are excused from the practice of their religion in their own persons, they are not careful about enforcing its precepts upon others. But if toleration is to be real, it must be exercised by the lower officials as well as by the higher, and this is not a result which is at all easy of attainment. Left to themselves, the Government would care very little what their subjects believed; but when indifference on this point makes them objects of hatred to a large body of fanatical opinion, they are forced to care about it in some degree. The result is that they refuse to see the breaches of toleration which are constantly occurring, and that they occasionally go the length of committing them in their own persons. It happens that one Dr. KOELLER, who has for the last thirty years been working as a missionary in the East, has lately employed a poor Turkish Ulema to look over a manuscript translation of the English Prayer-Book into Turkish. In September last Dr. KOELLER and the Ulema were arrested, and the manuscripts on which they were employed were seized. Dr. KOELLER was released in a few hours, but his manuscripts were retained, and the Ulema was handed over to the ecclesiastical authorities. What has happened to the Ulema is not quite clear. According to one story, he has been sentenced to death; according to another, he has undergone a preliminary examination. The narratives may perhaps be reconciled by means of a third account, which says that the ecclesiastical authorities have declared that the offence with which the Ulema is charged is one punishable with death; and, as there is no doubt that he did help Dr. KOELLER in the revision of his translation, it is probable that, but for Sir HENRY LAYARD'S intervention, he would stand a poor chance of escaping the penalty. The offending official is the Minister of Police, a personage whose punishment was in vain demanded by Lord DERBY in 1876. Sir HENRY LAYARD insists that Dr. KOELLER shall have his manuscripts restored to him, that the Ulema shall be set free, and that the Minister of Police shall be dismissed; and, failing to obtain any one of the three concessions, he suspended diplomatic relations with the Porte on the last day of the year.

At this stage the German and Austrian Governments come in, and, according to REUTER'S telegram, urge certain qualifying considerations on the English AMBASSADOR. Dr. KOELLER, they say, is not an English subject, and this is a point upon which, if we may judge from his name, the German Government ought to be well informed. Nor was it the Minister of Police who gave the order for the arrest, so that there is no reason for making his dismissal one of the concessions demanded. On the other hand, it seems unlikely that Sir HENRY LAYARD should have had the whole business before him for three months, and not have discovered the nationality of the man whose cause he was defending. And whether the Minister of Police did or did not order the arrest of Dr. KOELLER, it seems clear that he did not order the liberation of the Ulema. The fact that the Ulema's trial is still to come does not lessen the probability that it will end in his condemnation; and Sir HENRY LAYARD perhaps thinks that it may be easier to save him while his guilt has not been formally established than after he has been tried and convicted.

Probably the whole affair will end in a compromise by which the Ulema will be taken off the hands of the Turkish Government by some Missionary Society; Dr. KOELLER will once more be put in possession of his papers; and the Minister of Police will be removed to some other post. If the real facts come to be known, it will be interesting to

see what it is that has made the Porte so obstinate about a matter as to which it must have felt so little real concern. Why did the Minister of Police wish to conciliate the fanatical party, and why, if he did wish it, did the SULTAN think it expedient to sustain him for so long a time against the English AMBASSADOR? If Sir HENRY LAYARD has been employed ever since September in getting a manuscript restored to its owner, and in shielding a Mussulman schoolmaster from the anger of his superiors; and if in the end he could not get either of his demands complied with, except by resorting to the last resource of pure diplomacy, the influence of Great Britain at Constantinople must be singularly small. The other day it was hinted that Sir HENRY LAYARD was busy in making the SULTAN reform the whole administration of his Asiatic dominions. This new difficulty with the Porte may help to explain why this ambitious attempt has been abandoned. Sir HENRY LAYARD possibly reported to his Government that, until toleration had been secured in Constantinople itself, it would not be of much avail to insist upon its extension to Armenia.

MR. GLADSTONE'S BIRTHDAY.

MR. GLADSTONE'S answer to the Liverpool address on his birthday may possibly have disappointed some of his devoted admirers. It is not pleasant to arrive at the age of seventy; but Mr. GLADSTONE may properly be congratulated both on his remarkable vigour of mind and body, and on that popularity among a large section of the community which induces many persons to take an interest in a marked epoch of his life. Few men could expect a similar expression of good-will, and perhaps there is no man who would receive it in the same spirit and temper. One of the deputation which presented the address stated that at Liverpool the feeling of interest in the anniversary was not confined to the Liberal party. Many Conservatives were proud of their famous townsman, and shared in the disposition to celebrate his birthday. If they thought that on such an occasion there might be an intermission of political rancour, Mr. GLADSTONE lost no time in undeceiving them. "It is truly painful to me to find myself obliged to entertain any thought "on this day which tends to separate us from those "who entertain that kind inclination." Not for a moment could he refrain from denouncing the Government, and, in still stronger language, the majority of the House of Commons. Parliament, indeed, is even worse than the Ministers whom it supports; for, although it sometimes deviates into the right, it would even on those occasions willingly have done wrong. Mr. GLADSTONE condescends to share the approval which the House of Commons has bestowed on the new Constitution of East Roumelia; but, "had the Government given "the province niggardly institutions," and had the Opposition made an adverse motion on the subject, "that "majority would have supported the Government in that "matter just as freely and as readily as they have supported "them in the terrible iniquities of Afghanistan." An eminent advocate once addressed exactly the same argument to a puzzled jury. Having accused the counsel on the other side of erroneously asserting that the premises in dispute were in a certain parish, he was assured by his adversary that he had said nothing of the kind. "I do "not care," was the reply, "whether my learned friend "said so or not. If he said that the house was in A, he "was mistaken; and, as he did not say so, he would have "been mistaken if he had said so." As the House of Commons voted right in the matter of East Roumelia, it would have been wrong if it had given an opposite vote.

In one part of his speech Mr. GLADSTONE took some pains to disclaim the imputation of bad motives to his political opponents. He even admitted that persons of great intelligence, of great ability, and the highest public and private qualities, are opposed to him on political questions; but acts and motives are so inseparably connected that it is difficult to confine unmeasured invective to effects without reference to the guilty cause. "The "terrible iniquities of Afghanistan" can scarcely have been committed with the best intentions. Against 350 members of the House of Commons the charge of wilful and selfish political dishonesty is made in the plainest terms. They voted for a good Roumelian Constitution not because it was good, and they would corruptly have voted for a bad Constitution if such a course had been suggested by party interest. It is, in truth, impossible to accuse a Government and its supporters of the grossest misconduct without imputing to them either bad motives or invincible imbecility. "These controversies go to the "root of every question of public law and of public "honour." "They obviously and palpably threaten the "institutions and even the peace and order of the country." The institutions of the country, including the Union with Ireland, the Church Establishment, and above all the fundamental institution of private property, have indeed been recently threatened, but not by the Government. If the Ministerial policy obviously and palpably threatens peace and order, its tendency must be obvious to its authors, who again must be actuated by criminal motives. It would seem that Mr. GLADSTONE is occasionally half-conscious of the reckless intemperance of his language, and that he consequently guards himself by fitful protests against the only possible inference which can be deduced from his words. Controversies which go to the root of public honour can scarcely be conducted on both sides by scrupulously honourable men.

In his vehement birthday speech Mr. GLADSTONE repeated the alarming statement that there are still whole chapters of the discussion which he was obliged to omit from his speeches in Scotland. It would be perfectly easy for him to deliver a long oration on everything which the Government has done or has failed to do; but if the topics which he selected at Hawarden are fair specimens of the causes of his residuary wrath, his party has no reason to regret that his itinerant oratory was not more exhaustive. In one part of his speech Mr. GLADSTONE dated the commencement of the graver Ministerial misconduct from the retirement of Lord DERBY and Lord CARNARVON; but afterwards, in selecting two great crimes for exposure and denunciation, he inadvertently included one which was almost exclusively perpetrated by Lord CARNARVON himself. The other members of the Government probably acquiesced in the annexation of the Transvaal on the authority of the Colonial Secretary. Their confidence was perhaps confirmed by the more or less qualified approval of Lord KIMBERLEY, who represented the colonial policy of Mr. GLADSTONE'S Government. The annexation was, as the result has shown, of doubtful expediency; but the particular charge which Mr. GLADSTONE now urges against the Government is not so much unjust as childish. In his fury of intolerance he fancies that despotic government has been deliberately established both in the Transvaal and in Cyprus. He might learn, if he thought fit to inquire, that the Boers are perfectly welcome to representative government as soon as they acknowledge the authority of England. There are, on the whole, 8,000 of them; and Mr. GLADSTONE says that 6,800 are opposed to English rule. Lord CARNARVON would have done well to ascertain the opinions of the majority before he sanctioned the annexation; but it is not an easy matter to retract when circumstances have changed, and when vested interests have probably been created. The question is of secondary importance, and it will be settled in one way or another within two or three years. Mr. GLADSTONE'S fancies about a Transvaal despotism are peculiar to himself. He makes it difficult to express agreement with his conclusions even when he may be in the right. Morbid exaggeration obscures any underlying basis of truth.

On the appropriation of Cyprus many of Mr. GLADSTONE'S opponents might hold opinions differing only in degree and in colour from his own. The object of the acquisition has never been made intelligible; and even if the fee simple of the island had been desirable, the lease from the SULTAN and the quit-rent to be paid are not a little anomalous. On the other hand, it is probable that the prosperity and good administration of Cyprus will be greatly promoted by the substitution of English for Turkish authority. If any other Power had by fair or foul means acquired any province from Turkey, Mr. GLADSTONE would have exulted in the dispossession of the hated infidel. As Lord BEACONSFIELD has taken possession of Cyprus, his enemy indignantly complains that Englishmen are governing despotically subjects who were civilized for centuries when they were barbarians. Mr. GLADSTONE quotes a document addressed by certain unknown foreigners at Larnacá to the Consuls of the Great Powers. The subscribers, who may be traders, adventurers, or perhaps native Greeks,

apply to their respective Governments to interfere with the administration of the English Government. Mr. GLADSTONE, who has probably neither verified the signatures nor ascertained the justice of the complaints, assumes without hesitation that the memorial is composed in good faith, that all the statements which it contains are accurate, and that the English officers who administer the government are guilty instruments of a Cabinet bent on establishing despotism. "I want to "know," said Mr. GLADSTONE, "whether it is humi-"liating to have a paper like that read in our ears, and "to find that the subjects of almost every European "Power in Cyprus are addressing their Consuls in "language such as this, to say that if the existing state of "things be accepted by their Governments, they have no "alternative but to quit the island." One clause of the question admits of an easy answer. It is humiliating to have "a paper like that read in our ears" by such a speaker on such an occasion for such a purpose. It might have been thought incredible that a former Prime Minister should have implicitly concurred in an appeal to foreign Powers against the administration of an English possession. There is at present not the smallest reason to believe that Mr. GLADSTONE's informants have either a ground for their complaint, or any motive for their officious interference except a desire to embarrass the local Government. It is difficult to reconcile the impression produced by frantic prejudice with the respect which ought to be inspired by Mr. GLADSTONE's position and character. There may be some compensation to his well-wishers in the proof of his exemption from the ordinary influences of advancing age. It had long been thought a truism that provocations which might be irresistible in youth lost part or all of their effect when whitening hair calmed susceptibility of temper. Mr. GLADSTONE, whatever the calendar may report, has lost none of his youthful fire. On the contrary, with every succeeding year he seems to become more pugnacious, more impetuous, and more intolerant. The confidence of grave and thoughtful men in his judgment may be shaken, but passionate violence is acceptable to the mob.

THE NEW FRENCH MINISTRY.

THE Left Centre have not been happy in the circumstances of their departure from power. They have plainly outstayed their welcome. The chief business of a new Prime Minister is usually to choose his colleagues. M. DE FREYCINET's chief difficulty has been to get rid of M. WADDINGTON and M. LÉON SAY. If it be a merit to sacrifice personal dignity to patriotism, these eminent statesmen have deserved well of their country. Office seems to have appeared to them in the light of a divine mission which it was not lawful to abandon. They had put their hands to the plough, and they refused to look back until M. DE FREYCINET forcibly turned their heads in the direction of private life. France may fairly be congratulated on having seen the last of them in their official capacity. It was sufficiently absurd that M. WADDINGTON should be a member of his own Cabinet, considering the men he admitted into it and the measures to which he consented. But it would have been more absurd still if he had been a member of M. DE FREYCINET's Cabinet. Union ceases to be strength when it is a union of hopelessly discordant elements. It was very well, as long as the establishment of the Republic was still doubtful, that all who wished to see it set up should agree to work together for that end. For the time, the Left Centre and the Left had a common purpose in view. But when once the Republic had been started on the way the common purpose ceased to exist. The real differences between the Left Centre and the Left became more evident every day, and the only means of hiding them from view was for the Left Centre to surrender one point after another into the hands of the Left. That course has been gallantly pursued by M. WADDINGTON and M. LÉON SAY. They have yielded everything except the plenary amnesty, and even this was withheld rather because it was not heartily desired by the Left than because it was expedient to refuse it. To all appearance neither M. WADDINGTON nor M. LÉON SAY found this process at all distasteful. Their humility was proof against every trial; the harder the ordeal to which they were subjected the more triumphantly they seemed to come out from it. The best possible proof of this is to be found in their apparent readiness to take office under M. DE FREYCINET. Considering that the new Cabinet relies for support on the pure and the advanced Left, it was hardly to be expected that the Left Centre would wish to be represented in it. Considering that M. WADDINGTON had been in name at least M. DE FREYCINET's superior, it was hardly to be expected that he would wish to take office under him. Yet the Left Centre did wish to be represented in the Cabinet, and M. WADDINGTON did wish to take office under M. DE FREYCINET. It was only when M. DE FREYCINET declined to have M. WADDINGTON as a colleague that M. WADDINGTON sorrowfully consented to part from M. DE FREYCINET. It is a distinct advantage that this separation should have been at last effected. The Left Centre has been for the past year in a strangely false position. It has been busy in sacrificing one principle after another in the vain attempt to propitiate that cruel phantom, the "Union of "the Lefts." Whenever it hesitated about carrying this reckless process any further, it was reminded that the time had not yet come when Republicans could safely be ranged against Republicans; and, either in deference to this warning or from a well-founded conviction that, if it ranged itself against the Left, it could only do so on pain of resigning what by a polite irony was called power, it forthwith threw over another conviction. There could not possibly be a worse training for a political party. It is true, no doubt, that, if all sections of a numerous party are to act together, there must be a good deal of give and take among them. But, in the union of the Lefts, the give and take were so distributed that the Left Centre gave everything and took nothing. If this process had continued, the reason for maintaining the Left Centre as a distinct organization would have been at an end. If it is to be in all respects one with the Left, why multiply names and represent as two what is really and essentially one?

The new Cabinet is the first which has commanded a majority in the present Chamber of Deputies, and for that reason its accession to power is an event of real importance. As yet there has been no opportunity for the Left to show its capacity for governing the country. M. DUFAURE and M. WADDINGTON were exceedingly different in the temper which they brought to bear on public affairs; but they belonged to the same political party, and that party was not the Left. Under both, the Left were deterred from going all the lengths they wished to go by the difficulty of replacing the Cabinet if it were forced to resign; and though M. WADDINGTON cannot be said to have offered much resistance, he did offer some. A Cabinet taken wholly from the Left would not have allowed the Education Bill to hang fire for nearly a year; it would have turned out every official whose Republicanism was in the least doubtful; and it would not have suffered the principle of immovability to interfere with the extension of a similar process to the magistracy. Instead of being left to speculate how Frenchmen will take these changes, we should have known by this time how they had taken them. The very circumstance that the accession of the Left to power has so long been delayed will make it all the more necessary that, now that it is in office, it should show of what stuff it is made. If no programme had ever been demanded from the WADDINGTON Cabinet, and in part forced upon it, the new Ministers might have asked for time to consider what their policy should be. As it is, there is no pretext for preferring any such request. Their programme is marked out for them by M. WADDINGTON's successive capitulations. France will now see the exclusion of religious orders from teaching, and the removal of judges and officials who have not in all respects moved with the time, carried out by a party which genuinely believes that in such legislation as this the Republic will find the tranquil security which has been denied to it under M. DUFAURE and M. WADDINGTON.

A good deal of blame has been thrown on M. GAMBETTA for his refusal to take the part which, but for his retreat into the Chair of the Chamber of Deputies, would have devolved upon him as leader of the Parliamentary Left. It is by no means clear, however, that in the interest of the Republic M. GAMBETTA's abstention is to be regretted. Supposing that M. GRÉVY had sent for him and he had accepted a commission to form a Ministry, he would have had to make the attempt with a Chamber as to

which it is by no means clear that it really represents France. With a Ministry like M. DE FREYCINET's it makes very little difference whether the present Chamber represents France or not. No exaggerated expectations are entertained as regards their success, and nothing particularly disastrous is likely to follow from their failure. If they resign, M. GRÉVY will simply have to provide them with successors, and they are not likely as a body so to distinguish themselves that the performance of this duty will give M. GRÉVY any great trouble. The Republic will in all probability be wholly unaffected by the personal changes effected in the Cabinet. M. GAMBETTA will still be waiting till his time arrives, and as long as he maintains this attitude, the Republic will not have played its last card. Supposing, however, that M. GAMBETTA had himself taken office, the situation would be very different. There would then be no reserve of force on the Republican side. The politician from whom so much is still expected would have been tried and found wanting, and an immense encouragement would have been given to the reactionary parties, who are perfectly willing to resume their intrigues against the existing order of things the moment that they see the least encouragement to do so. It may be said that this experiment must be tried some day, and that nothing will be gained by delaying it. That would be true if the present Chamber indisputably represented France; but it is not true so long as it is possible that it does not represent it. France may not yet have seen the last of M. GAMBETTA's opportunism, and one reason why he has preferred to put M. DE FREYCINET in office instead of taking office himself may be that he wishes to see the reception which a Radical policy meets with from the constituencies before committing himself irrevocably to its support.

THE AMERICAN PRESIDENCY.

THE chances of the Presidential election of this year suggest to foreigners a curiosity which is not the less legitimate because it is wholly disinterested. If any Englishman could exercise even the smallest influence over the result, he would have no object except to promote the best possible choice. Popular election, even when it is artificially restrained as under the Constitution of the United States, has an advantage in tending to increase the power of the head of the Government. The President is not indebted for his elevation to either branch of Congress, and he is returned by a larger constituency than the members of either body. The best American politicians have not regarded with favour the increasing influence of Senators of the dominant party on the Executive Government. The President ought to be above considerations of party interest, which nevertheless too often affect his policy. Mr. HAYES, although he is not a candidate for re-election, has lately caused just dissatisfaction by his want of firmness in abandoning the sound doctrines on currency which he asserted in his Message to Congress. Although all the principal Republicans approve both of the repeal of the Legal Tender Act and of a limitation of the coinage of silver, they have persuaded the PRESIDENT that it is dangerous to enact sound measures which might possibly affect the Presidential votes of some of the North-Western States. The PRESIDENT apparently thinks it a point of honour not to damage the prospects of the party by which he was elected. His immediate predecessors impaired the independence of the highest office in the Republic by opposite methods. Mr. ANDREW JOHNSON engaged in a rash and hopeless conflict with Congress; and General GRANT, after brief resistance to dictation, made an arrangement with the Republican leaders of the Senate for the distribution between the contracting parties of power and patronage. A President more resolute than Mr. HAYES, and equally intelligent and upright, might do great public service, and he would probably receive popular support.

At present it seems probable that General GRANT will be the Republican nominee and the successful candidate for the Presidency. The supposed rule, not to be found in the Constitution, by which a third term of office was prohibited, has lost its force by the simple process of becoming a subject of discussion. Arbitrary maxims have great influence in human affairs, but only as long as they are taken for granted. Within the last year or two the people of the United States have for the first time become aware that the doctrine which was practically taught by WASHINGTON is only an unauthorized gloss on the Constitution. The breach of the tradition, while it no longer shocks popular opinion, has the attraction of a political experiment. The circumstances are favourable to the introduction of a political novelty. No citizen of the United States has since the War of Independence acquired a military reputation equal to that of General GRANT; and as a candidate for the Presidency he will have the advantage of meeting with competitors who are neither formidable nor famous. While he is the best-known member of one of the great parties, he is not especially obnoxious to the other. The Southern States, which form the main strength of the Democratic party, probably feel no resentment against the general by whom they were ultimately defeated. After the end of the Civil War, General GRANT gave no support to an intolerant or revengeful policy. The Confederates were outmatched, but their honour was saved. A President chosen, not because he was a Republican, but because he was a great soldier, would be more acceptable to the South than a hostile politician of the same stamp with Mr. SHERMAN or Mr. BLAINE. It happens that the Democrats have for the moment no candidate who excites any considerable enthusiasm. Mr. TILDEN is thought by experts in such matters to have lost his chance of nomination; and no successor to the post has yet been discovered. It is not thought impossible that one or two Southern States might ensure the election of General GRANT by voting for him in preference to a Democrat. If, on the contrary, the contest is to be decided by a trial of strength between parties, the Republicans seem to have the better chance. The Democrats may possibly recover New York, but they have hopelessly lost the control of Ohio.

General GRANT, though he has not yet professed his desire for a third term of office, could not have consulted his own interests more sagaciously if he had been the most eager competitor for nomination. Alone among American politicians he has understood the advantages which may result from absence and from silence. His countrymen have long been proud of his rhetorical deficiencies; but they perhaps imperfectly appreciate the convenience of not being expected to speak. As the recipient of unexampled public honours in the form of great meetings, of banquets and addresses, General GRANT has given offence to no man, and he has pledged himself to nothing. He left Philadelphia after a week of gigantic festivities as free from engagements as when he landed at San Francisco. His adherents may complacently contrast him with a contemporary in England who is also suspected of being an unavowed candidate for supreme power. The visit to Philadelphia involved much less political inconvenience than the equally noisy visit to Midlothian, for General GRANT left all the speaking to his irresponsible admirers. Having enjoyed triumphs in some of the principal Northern States, he is now about once more to stimulate public interest by remoteness from his admirers. He left Philadelphia for Florida on his way to Havannah, with the intention of remaining abroad till the summer. It is possible that he may take the opportunity of considering on the spot the plans for a canal to unite the Atlantic and Pacific. M. DE LESSEPS, who had at first made the mistake of projecting his scheme independently of the Government of the United States, now wishes General GRANT to preside over an enterprise which will necessarily be subject to American control. Republicans who prefer rival candidates unanimously urge General GRANT to accept a post which would be useful, honourable, and lucrative; but it would argue a strange want of ambition to prefer the chairmanship of an Interoceanic Company to a third term of office as President of the United States, with a chance of yet another election. General GRANT may perhaps not deem it inexpedient to stimulate the zeal of his supporters by reminding them that they are not the only claimants for his services. A silent and absent candidate, who is supposed to hesitate as to his acceptance of a nomination, occupies the strongest of all possible positions.

It would be absurd to affect ignorance of General GRANT's comparative failure during his former occupation of the Presidency. When he was first elected, he appointed a Cabinet on grounds of supposed personal fitness, without reference to the wishes of the Republican leaders. He was at once sharply reminded of the dependence of the Presi-

dent on the Senate, which he had himself inadvertently augmented by the part which he took in the squabbles with his predecessor. He was compelled to part with the Ministers of his choice in exchange for nominees of the Republican party, and he never, during his first or second term of office, again attempted to rebel. During his administration the scandal of official corruption reached its highest point, and the comparative purity of the Government of Mr. HAYES shows that the PRESIDENT must have been too negligent in his appointments. Some uneasiness has been caused among the advocates of General GRANT's candidature by the selection of Senator CAMERON as the Chairman of the Republican Convention which is to meet in June at Chicago. No other eminent member of the party is more thoroughly imbued with the questionable traditions of political management. It is not believed that Mr. CAMERON would willingly promote the election of a President who would in any way further the reform of the Civil Service. The organization of party for the sake of obtaining place, and the disposal of places with exclusive regard to the interests of party, are practices identified for many years with Mr. CAMERON and his family. Nevertheless it is not impossible that General GRANT, if he is re-elected, may disappoint the expectations of friends and enemies. He will have attained an unprecedented honour, if at all, by the choice of the people, although politicians and sections of parties may have sought to make use of the general enthusiasm. Relying on the confidence of the great mass of the community, he may perhaps safely reject the dictation to which he succumbed when he was a novice in administration. Notwithstanding his former bluntness of perception, he cannot but understand that it is for his credit and interest to surround himself with able and honest men. If he should be thwarted by factious intrigues in attempts to purify the administrative system, he may confidently appeal to the nation. There is no reason to suspect that General GRANT will be deluded by the idle clamour which affects to require the aid of a "strong man" in repressing illegal practices in the South. He has lately taken opportunities of protesting against distinctions between North and South, and he has expressed friendly feelings to those whom he formerly met in the field. In the United States there is no danger of a dictatorship, and a vigorous ruler might do much good. It is not impossible that, if General GRANT resumes the Presidency and if his administration is successful, he may retain his office for many years or for life. Even his adversaries no longer affect to be frightened by the prospect of an Empire under an American CÆSAR.

MR. COWEN ON THE HOUSE OF COMMONS.

DURING the last few years many persons and many public bodies have had a bad time of it, and the House of Commons has certainly not been an exception to the rule. It has not lost anything of its power or importance, but it has had to listen to an extraordinary amount of uncomplimentary opinion. Its foes have not taken the least trouble to dissemble their feelings, and its candid friends have been very candid indeed. From the high contemplative position of Mr. GLADSTONE—who seems to wonder how he is to reconcile the existence of such a House of Commons with the providential government of the world—to the more practical point of view of the Home Rulers is a long way. But from all conditions of men unfavourable comments upon the House of Commons have abounded. Even its defenders have for the most part been merely apologetic, and have chiefly contented themselves with asking what an overworked House, with troubles abroad and obstruction at home, could be expected to do. It is therefore somewhat comforting to see that a defender has in the last days of 1879 arisen who is bold enough to be less compromising in his advocacy. Mr. JOSEPH COWEN is not a person from whom defence of the House of Commons assumes a commonplace and matter-of-course aspect. Mr. COWEN does not often deserve either of these unsatisfactory epithets, and in his capacity of member of Parliament he is especially far from deserving them. In the mouth of a member of some governing family, trained from generation to generation to regard the House, and its own presence in that House, as immutable and necessary features of the universe, praise of St. Stephen's and its frequenters, though it may be perfectly sincere, often has an appearance of something like insincerity. It is felt that the advocate has a kind of standing retainer, and that his advocacy is a matter of course. In the case of an independent member—and Mr. COWEN happens to be an exceedingly good specimen of an independent member—the thing is different. When the first delight of hanging up the hat on a privileged peg is over, the independent member is very apt to magnify his own office by depreciating the House. It would not be very difficult to name persons occupying a similar position to Mr. COWEN's who have attempted, as an American would say, to "belittle" the House of Commons for the edification of their constituents, and by way of impressing on those constituents what very superior persons they themselves are. Observers of some little shrewdness know very well how to interpret this phenomenon, and are not often wrong in assuming that the person who quarrels with the weights and balances of the House of Commons has himself been weighed in those balances and found wanting.

There was nothing, it may be said, very novel in the eulogies which the member for Newcastle passed upon the House of Commons of our days. He pointed out that it was absolutely pure, while not very long ago it had been utterly corrupt; that it was exceedingly hard-working, while not long ago its majority at least were extremely idle; that the performance of even the routine duties of a member was no slight tax on mental and bodily fortitude, and that the House has a kind of esoteric public opinion—if the phrase be allowable—which usually operates in a very healthy and sensible manner. All these things have been said before, and we may add that it is exactly because they have been said before that it was worth Mr. COWEN's while to repeat them now. It would be difficult to discover brand-new virtues in such an old institution as the House of Commons; its excellence can only lie in practising the old virtues which from time to time get a little out of fashion with it. The force of this particular speech arises from the fact that the speaker is a remarkable illustration of his own words. Mr. COWEN entered Parliament with no advantage over the majority of members, and with some disadvantages as compared with not a few of them. On a very considerable number of points he is not in accordance with the views now prevalent in that assembly—nor, we may add, with the views which will, we hope, long prevail there. But because he has endeavoured, in his own words, to speak with a view to wisdom, justice, and the customs of the assembly itself, he has made himself already a considerable position. It is possible—the question has been a good deal debated of late—that the multiplication of persons like Mr. COWEN in the House might be productive of some difficulty. Their views would be grouped in so many different collections that it might be hard to secure a working majority for any Government. Mr. COWEN's own practice, however, has to a certain extent answered this doubt. The constant weakness of the political party to which he in the main belongs has been its tendency to make some theory of irregular verbs into a test question, and to refuse to sink this, whatever may be the position of the State. This attitude has been strikingly illustrated in the present week by the two most illustrious members of that party, Mr. GLADSTONE and Mr. BRIGHT. When Mr. GLADSTONE bemoans the mysterious action of the Divinity in allowing intelligent and presumably moral Conservatives to exist; when Mr. BRIGHT informs the inquiring cabman that "the Tory clique will doubtless have another lie "ready for you as soon as you have answered the one with "which they are now endeavouring to deceive you," they exhibit conditions of mind in which successful handling of the practical concerns of life is impossible. Mr. COWEN has, we doubt not, far more points of disagreement than he has points of agreement with the present Government and the present House of Commons. But he has the wit to see when to lay stress on the points of agreement and when not.

There is one principle laid down by Mr. COWEN which, if it were generally kept in view, would make the House of Commons a much pleasanter sojourn, and a much more efficient instrument of government, than it now is. "The "men who succeed are the men who accept the conditions "in which they work, and who labour fairly within the "legitimate lines." Of course such a principle as this is not intended for the persons who declare with engaging frankness that they go into Parliament declining these

conditions and determined to break through those lines. But that there is a considerable contingent among those who yearly join the House which does not act upon this principle, though it may nominally accept it, is pretty evident. There are the people who go as modern GRACCHI with the comfortable consciousness that the worst doom they can meet will be extinction—a doom which rarely fails them. There are the people who go to enlighten and instruct an ignorant House, with the result of receiving, if they have the wit, considerable enlightenment and instruction of a not altogether pleasant kind themselves. The old saying is as true as ever, despite the events of the last few years, that none have gone about to break Parliaments, but in the end Parliaments have broken them. Nor is there any reason to think that the present House is in any way unworthy of its predecessors, if it be judged from any reasonable point of view. It seems to have been thought lately that the only thing in which it is legitimate for a Parliament to agree steadily is destruction. Of all the freaks of party warfare, the most novel and the oddest is the objection taken to a majority for constantly approving that of which they do approve. It has been made a reproach to the present House of Commons that its members have not manifested a little engaging inconsistency, and have refrained from varying the monotony of Parliamentary proceedings by a vote or two of want of confidence in persons whom they are quite willing to trust. Some of their critics, indeed, seem to find in this the head and front of their offending. If they had been illogical they might have been pardoned; but to know your opinion and stick to it is a crime most tolerable and not to be endured. Mr. COWEN's claim—a very modest one—for the assembly of which he forms a part is that the harsh verdict which has been generally pronounced upon it will be softened by history. We do not know that the verdict is so general as Mr. COWEN thinks; but, if it be so, there can be no doubt about the rest of his proposition. The present House of Commons has been sorely plagued within. It has not perhaps been one of the most vigorous of Houses, or one of the most apt to take the initiative; but it has had at least this merit—that it has seen what was the principal and chief thing to do, and has done that. Naturally the people who preferred that this thing should not be done have had their quarrel with it. But this is a matter of opinion in which they must bow, as others have had in their time to bow, to the will of the majority. No charge of any real weight can be brought against the House of Commons from this point of view. The point of view from which such a charge could be framed Mr. COWEN indicated clearly enough. Parliament, he said, is the place in which the voice of the people is heard, their rights considered, and their wrongs redressed. It is the instrument which frames the laws under which we live. If it could be shown that the present Parliament has failed to perform any of these functions, then indeed a charge against it, and a heavy one, would lie. But, except that the law-framing business has gone on with a certain sluggishness, due to very well-known causes, on none of these points can just exception be taken. The voice of the people has been constantly heard; and it has, on the whole, sanctioned in an almost unprecedented manner the general course of Parliament. Perhaps we may surmise that this is the very fact which the decriers of the present House of Commons cannot forgive.

THE TAY BRIDGE DISASTER.

NO words either of narrative or of comment can do justice to the terrible disaster at the Tay Bridge. To the victims, indeed, death came with fewer circumstances of terror than in many more commonplace accidents. They had no warning of the destruction that was waiting for them, and the suddenness with which they fell from a height of more than a hundred feet probably deprived them of consciousness even before death had come. When this is compared with the premonitory terror which sometimes anticipates, and the lingering agony which so often follows, a railway accident, it will be seen that it is not the sufferers themselves that are most to be pitied. But the very incidents which in their case deprived death of some at least of its terrors seem only to add to them in the case of the relations and friends who are left alive. As we read of the anxiously watched movements of the train, of its slow progress towards the chasm that was so soon to open for it, and of its sudden descent into the seething waters beneath, we feel something of the linked horror long drawn out that was spared to those whom it carried. The catastrophe strikes the imagination more than the foundering of the most crowded ship at sea, because of the nearness with which it is brought home to us. Few people by comparison have ever made, or are ever likely to be called to make, an ocean voyage; but to travel by railroad, at least in England and Scotland, is now a part of the common lot of mankind. We have all at one time or another looked from the top of some great viaduct, and wondered what would be the consequences of its giving way. The conditions against which the Tay Bridge failed to contend were infinitely more severe than those by which an ordinary viaduct is confronted, but the likeness is close enough to enable every one to represent the accident to himself.

The destruction of the Tay Bridge suggests considerations of great importance to those interested in the safety of similar structures. No other bridge did fall in the tremendous storm of Sunday last, but there may be several which were only saved by some very trifling difference. It can scarcely be doubted that the accident was caused by the increase in the resisting surface supplied by the train as it passed between the girders which mark the central portion of the bridge. The tempest then found an enemy worthy of its full strength, and the fiercest gust even of that unparalleled storm seems to have synchronized with the arrival of the train at that particular point. The wind, which had hitherto been divided by the lattice-work of the girders, now beat against a solid expanse of wood and iron. It will be naturally and anxiously asked whether there had been nothing in the previous history of the bridge to give any warning of the danger. Such an inquiry is not disposed of by a statement that the strain was one of exceptional violence. When the power of a bridge to resist weight is tested, the experiment is made to cover far larger demands than can ever be put upon it; and the same precaution ought, so far as possible—though this is obviously a very much more difficult matter—to be taken in case of lateral pressure. The stability of the Tay Bridge seems to have found more assured believers among experts than among uninstructed observers. The unusual interest felt about the train of last Sunday, and the speculations whether it would attempt to cross during so great a storm or be detained until the wind had lulled, point to an uneasiness which is not wholly that of men who are wise after the event. Neither those who designed the bridge, nor those who examined it on behalf of the Government before it was opened for traffic, seem to have given more than a passing thought to the danger to which it has actually succumbed. Indeed such a danger seems hardly to have been contemplated. General HUTCHINSON's Report dealt with the ordinary risks to which bridges are subject, and suggested methods of meeting them. The foundations of the piers were to be carefully watched to ensure that no scouring action should be going on unperceived. The power of the bridge to bear a much heavier weight than would ever be actually placed upon it was duly certified. A low limit of speed was fixed for the trains while crossing it, to prevent any undue oscillation from this cause. But the only notice taken of the possibility of such a disaster as has now taken place is to be found in a sentence which records the wish of General HUTCHINSON to have an opportunity, if possible, of observing the effects of high wind when a train of carriages is running over the bridge. Whether this opportunity was ever found, or what was the result of the observations taken of it, does not appear. It is fair, however, to say that, according to the account of the works given on the occasion of their completion, "no part "of the structure has shown a sign of failure, although "the storms, since the highest and most exposed parts of "the structure were built, have been of unsurpassed "severity." Either the storm of Sunday last was the most violent ever known at Dundee, or the capacity of the bridge's resistance to the wind blowing down the valley had been insensibly lessened by exposure, or the pressure while a train was actually passing over the central part of the bridge had not been adequately allowed for.

It is plain that the disastrous experience of Sunday will necessitate additional care in the building of bridges of great length in very exposed situations. In most

fabrics of this class, where the height and length are exceptional, the width of the roadway gives a much larger power of resistance to wind than proved to be possessed by the bridge across the Tay. A structure something like two miles long had been made just wide enough to admit a single line of rails, and when the stress of the storm fell upon it, it went down like a fence that is too long and too high in proportion to its thickness. The object of making the bridge so narrow was of course to save money. As no accident at all resembling this had ever been known to happen, it was not strange that the economical argument carried the day and that any suggestions that the bridge might prove too slight to be safe were dismissed as the forebodings of engineers who had not had the good fortune to be employed. Now that these predictions have turned out to be true, a very serious responsibility will rest upon the Directors of any line who omit to have any very long bridges or viaducts there may be upon their line carefully re-surveyed. The requirements of the Board of Trade in regard to new works must undergo a corresponding revision. It is at last known what a bridge of this kind may have to endure. It will be inexcusable in those who, in whatever capacity, have the control of such undertakings, if they are again left insufficiently equipped for the conflict which a sudden storm may bring upon them. It is the more essential that such precautions should be taken because the alternative which has been suggested—that trains should only cross these bridges, as steamers cross the Channel, "wind and weather permitting"—is one which would not prove at all easy in working. Supposing that this particular train had been ordered to "lie-to" till the storm abated, the passengers would have been put to great inconvenience, and the whole traffic of the line would have been disarranged. Of course, as it turned out, it would have been infinitely better, even in the interest of the Company, to face these inconveniences than to provoke the expense of various kinds which the fall of the bridge will bring with it. But when the memory of this calamity has died away, railway officials will be very unwilling to inflict a large amount of annoyance on passengers on the improbable chance of a bridge being blown down. Those who travel by land are less patient of such interference than those who travel by sea, and it will not be wise to assume that in the long run they will submit with patience to be detained for a night by the side of the line rather than risk the passage during a storm. If a railroad is allowed to carry passengers across an arm of the sea, the Company should be compelled to make it morally certain that it can carry them safely.

SIR STAFFORD NORTHCOTE ON THE LIQUOR TRADE.

THE speech which the CHANCELLOR of the EXCHEQUER delivered to the Exeter publicans on Tuesday night was one of those addresses which, intentionally or unintentionally, are susceptible of rather opposite interpretations. There were parts of it which might have been taken, and probably have been taken, as indicating an intention on the part of the Government to bring in some new measure of legislation directly framed to promote temperance. Such a phrase, for instance, as the following, "You have, I believe, the opportunity of co-operating in "the promotion of measures which will to a great extent "check and keep down the evil," might, if it were taken alone, seem decisive on this point. But the burden of the speech was, on the whole, very different from this; and it was evidently intended as a consolation, not as a discouragement, to the licensed victuallers. Sir STAFFORD NORTHCOTE seems to accept the existing concentration of the trade in the hands of a few persons as an almost ideal arrangement with which no practical politician would think of quarrelling. He is anxious to keep improper persons out of it, to check the multiplication of licences, and so forth. It may readily be imagined that his hearers saw nothing objectionable in this. The holders of an immensely profitable monopoly are seldom likely to object to any plan for shutting out fresh sharers, whether proper or improper, and excessive competition is certainly no more for a licensed victualler's interest than it is for the interest of any other tradesman. To the hints which Sir STAFFORD threw out as to further regulation of the traffic by measures intended to assist the publicans in the good conduct of their establishments, it might have been thought that more exception would have been taken. But the common practice of sneering at the supposed desire of the licensed victuallers to put down drunkenness is not a very sensible one. It is clear that the drunkard is not the publican's best customer, unless the general impression as to the evil effects of drunkenness is altogether erroneous. The drunkard (at least the publican's enemies are never tired of asserting it) loses his health, his employment, and other conditions necessary to the earning of money regularly. If he does not earn money, he cannot spend it, the licensed victualling trade being honourably distinguished by its strict adherence to the ready-money principle. Besides this, the drunkard is a nuisance to other customers, brings the house into ill repute, and is in other ways, notwithstanding his absorbent tendencies, a bad bargain. There can be little doubt that the licensed victualler's ideal is something not very different from Sir STAFFORD NORTHCOTE's own. This would seem to consist in a close corporation of not very numerous members maintaining strict order in their houses, and, selling ample but not exorbitant supplies of liquor to a regular and well-behaved *clientèle* of respectable customers, who would no more think of getting drunk than the average English gentleman of to-day thinks of getting drunk on the contents of his own cellars.

It is possible, however, that some people who are no fanatical enemies of the publican may demur a little to this official acceptance of an exceedingly artificial arrangement as something self-evident and axiomatic. Sir STAFFORD NORTHCOTE says confidently, "You cannot allow "unrestricted competition in a trade of this kind," and repeats the same statement in a good many different forms. At the same time he has equally little doubt that "a trade of this kind" is in itself a necessity, and only wants regulation and management. These two convictions, joining hands, seem to incline him to look upon the existing publican, licensed as he is and protected to a certain extent against competition, as a kind of happy compromise, on a par with the many other happy compromises which adorn and support the British Constitution. Now we are inclined to think that the dismissal of the proposal of unrestricted competition with a brief "you cannot have it" is a little too cavalier and offhand a fashion of treating a very complicated and a very grave question. "I believe, in those cases where "the attempt has been made," says the CHANCELLOR of the EXCHEQUER, "the result has been such as not to en- "courage repetition." The chief attempt—that at Liverpool—was made under very unfavourable circumstances, and was not altogether one of pure and simple free-trade; yet we believe we are justified in saying that the result converted not a few persons to the principle, if, as Sir STAFFORD NORTHCOTE says, it discouraged others. The truth is that the question in its present state is so complicated by social arrangements, by the private interests involved, and, last, not least, by the almost theological heat which has been imported into its discussion, that few experiments of the practical kind have much chance of getting fairly worked. The advantages o the free-trade system are, however, so obvious that, in default of any sufficient practical confutation, they certainly seem worth considering. The present system has the almost unparalleled disadvantage of constantly creating fresh interests, and of increasing, reducing, and altering old ones in the most capricious and irregular manner. There is nothing at all like it in any other trade or in any other department of administration. The CHANCELLOR of the EXCHEQUER would reply that the liquor trade is like no other trade. But the danger of this argument is evident. The opponent of the trade has only to press the question, How is the liquor trade unlike any other trade? and it will be hard for his antagonist to devise in the long run any answer which does not amount to a condemnation of it.

It might be rash to advocate free-trade in drink, because the embroilment of the whole question is so great that hardly any but fanatics would go to the point of advocating any single solution of it. But there seems to be something inconsistent in admitting that the Legislature ought to be constantly regulating the trade, and at the same time asserting that the arrangement which gives us a limited number of licensed traders is something sacred, and not to be touched. The combination may be satisfactory to the publicans; but it does not follow that it is satisfactory

to the public. The historical truth of the matter is that the licensing system, originated solely as a means of revenue, has, since the disturbance of the public mind on the question of drunkenness, been defended on an entirely different ground, which its inventors never dreamt of occupying. It is at least arguable that in the present state of public opinion a free-trade system would be the best for the purposes of good government, public health, and public morality; that the present exceptional position of the public-house has a good deal to do with its least satisfactory characteristics can hardly be doubted. Having, beyond a certain point, no fear of competition before his eyes, the publican is not, like other traders, obliged to study the convenience and the interests of his public. The very closing of his house during certain hours—a measure, no doubt, excellently intended, and, in some cases, salutary—often results in a rush being made to it as soon as it is opened again, by persons who, if it were always open, would, as likely as not, pass it by. The artificiality of the whole thing, in short, could hardly be carried further. Sir STAFFORD NORTHCOTE, however, seems enamoured of this artificiality, and would like, if possible, to make it still more artificial. It sometimes seems to the student of proposed reforms of this kind that we may at last (putting local option and permissive prohibition aside) come to a plan in which each ratepayer will be allowed his quota of alcoholic liquors during the year, and no more, like boys at some public schools. The opposite system of a perfectly free trade combined with stringent adulteration laws, and with police supervision to prevent disorder, may well seem attractive to some persons in contradistinction to these elaborate tinkerings. Nor will such persons, it is to be feared, be contented with the dictum that "they can-"not have" what they want. They will say that the impossibility is not shown; that instances of a not wholly dissimilar system have existed, and do exist, without any bad result; and that at any rate the plan deserves more trial than it has had. It is noteworthy that even Sir STAFFORD NORTHCOTE himself, despite his belief in the carefully regulated monopoly of the licensed victuallers, looks for improvement in the manners of the people chiefly to "the introduction of counter attractions and "the influences which may be brought to bear on them." These are means quite independent of the most elaborate system of licensing and regulating the sale of drink. To give people some other resort than squalid drinking-bars, and some other occupation than the consumption of heavy beer or fiery spirits; to teach them, as their so-called betters have been taught, that excessive drinking does not pay, are more scientific means for the prevention of drunkenness than the interposition of obstacles in its way, except at certain places, during certain hours, and for the pecuniary benefit of a certain number of persons. When these means have been satisfactorily brought to bear, the drink question will settle itself as far as any question affecting and affected by the idiosyncrasies of individuals can ever get itself settled in this world. Meanwhile efforts at the other end are doubtless laudable, if not very promising; but it seems unnecessary to complicate a sufficiently difficult question yet further by postulating the limited and licensed victualler as a necessity of existence.

THE RECENT FIGHTING AT CABUL.

THE news which arrived last Monday, while thoroughly satisfactory, is only what reasonably might have been expected. As we endeavoured to show last week, there was no ground whatever for the pessimist and panic-stricken views which some of the newspapers seemed to take almost a pleasure in unfolding. Because General Roberts, as a matter of prudence, had thought proper to withdraw his troops from the extended position they occupied, and, in the absence of a distinct base, to concentrate in the entrenchments which he found ready to his hand, that was no reason for supposing that the Afghans would immediately obtain the ascendant and show a degree of military spirit which they have never manifested before. The really unsatisfactory features in the case were the loss of the two mountain guns in the previous fighting, and the necessity involved in concentrating on Sherpur of giving up temporarily the occupation of the city of Cabul. The former was one of those minor catastrophes sufficiently explained by the nature of the ground on which the action was fought—a succession of what in England would be deemed mountain spurs, where the different detachments engaged were separated from each other and incapable of receiving or giving mutual support. Under such circumstances it would hardly be known to one detachment what was happening to those in its neighbourhood; it is only from this consideration that it can be explained how it was that the guns, after having been lost, were not immediately re-captured. The temporary withdrawal from the city was unfortunate, because the uncertainty thereby given to our movements was necessarily calculated to embarrass those of the residents who were well disposed towards us. The military governor of Cabul can hardly expect to be well served, if he is liable to enforced retirement within the cantonments whenever the country is "up." But otherwise events appear to have favoured us. It could hardly have been expected that the enemy would make such a feeble opposition to the advance of Gough's brigade through the difficult country which culminates in the Lataband Pass, still less that they would be so foolish as to attempt a serious attack on Sherpúr itself. That this attack was not made with any real determination is sufficiently plain from the telegraphic account. The south side of the position is enclosed by a high wall and ditch, with a parapet, in rear of which comes the line of masonry barracks, more than a mile long, and with a musketry curtain on the roof, thus giving a double line of fire. The flat country beyond the cantonment on this side is covered with gardens and enclosures, which appear to have been occupied that morning by the enemy, who kept up from them a desultory but innocuous fire upon our wall. On the east and west—the shorter—sides of the great rectangle which forms the position, the defensive works were not completed, and they were especially unfinished at the north ends, where they abut on the Bemáru heights, which enclose the position on the north. Here the line of defence may be said to be arbitrary, for a continuous range of villages and enclosures extends down the slopes of these hills, of which we had occupied some, and made a roughly entrenched line through them, leaving the rest to be occupied by the enemy. There was not time to clear away all the enclosures beyond our line, and so the assailants could come close up to it. Here, then, there was a fair opening for attacking a garrison not better than or not so good as the assailants—for the advantage in such a case lies with the defenders. But the Afghans have never shown themselves at all on the same level as our troops, native or European, as witness the way in which the other day a small force at the Shuturgardan, without a single European except their officers, beat off an attacking party very much more numerous than themselves, although the entrenchments defended by our troops on that occasion were of the flimsiest character. At Sherpúr the attack was made without much spirit. We hear, indeed, of reinforcements being sent from the reserves to the troops holding the Bemáru position. But this merely implies that the main body in reserve furnished supports to the points where the enemy began to develop their force, not that the first line was at all pressed. The slight loss suffered on the 23rd is significant on this point; and, indeed, as soon as Roberts found the assailants sufficiently advanced to give him a chance of getting at and punishing them, he went out with some cavalry and horse artillery to try to take them in flank. It was then a repetition of the old story; the enemy, threatened in flank, began to run. It does not appear that they were severely punished; the apocryphal stories always current on these occasions about the enemy concealing their loss by carrying off their dead and wounded must be accepted with reservation.

So ended the attack on Bemáru; if it had ever had the smallest chance of succeeding, then clearly we have no business to be there at all. It is only because we are presumably invincible against such an enemy, when behind walls of any sort, that we are able to hold our own in such a country with our small numbers.

The opposition made to the advance of General Charles Gough's brigade appears not to have been more persistent than the attack on Sherpúr; and, as for that displayed against our troops between Jugdulluk and Lataband, when we hear of an attack of two or three thousand men lasting all day and resulting in a loss of one Sepoy, we can form an opinion as to what must be understood by the expression. This sort of opposition is, however, sufficiently troublesome. These fellows gather on the hills, and although they give way when pushed, only strong detachments can move about under such circumstances. Evidently the tribes on the line from Gundamuck through the mountains to Cabul will have to be brought to reason somehow, and if necessary chastised. We cannot be said to have proper occupation of the country until we hold all the strong points along the road unchallenged, and until our detachments can pass from one to the other without molestation. And this will no doubt be accomplished in time. We shall attain to the same state of security here as we have now through the Kyber—that is, it will be secure so long as it is held in great strength, and with the greatest vigilance.

As we observed last week, the loss of men so far has been very moderate, testifying, among other things, to the skill with which they have been handled in action; but the loss in officers, although not large absolutely, has been disproportionately large, and the disproportion has been greatly increased during the week. In one skirmish, with a reported loss of only a single Sepoy, that excellent officer the Commandant of the Bengal Sappers and Miners, Major Thackeray, V.C., is dangerously wounded. And in a second action of the same sort the loss is again one Sepoy and an Artillery officer killed. This disproportion may be partly the result of that luck which plays so large a part in the affairs of war; but the great difference between the dress of

the officers and the Sepoys has probably a great deal to say to it. In general actions no aim, as a rule, is taken, but men fire away indiscriminately; in this way only can the small proportion of hits to misses in great battles be accounted for: but in these protracted skirmishes on the hill sides, where every one is plainly seen, the officer can be easily distinguished; while his duty requires him on such occasions to expose himself in an exceptional degree.

The Cabul Valley itself is now clear, and officers whose business lies in the way of supplies or telegraphy or survey are probably now going about it as they did before the late uprising—with no larger guard than a corporal and a couple of files, or an orderly trooper. Good progress had been made towards converting the passage through the Lataband Pass into a road practicable for all transport other than wheeled carriages. The carriage road is understood to be complete as far as Jellalabad, and from there to Gundamuck there are no great obstacles; and as that part of the country is comparatively low, there should be no difficulty in continuing to work on this part of the line through the winter. Beyond that point the snow will make progress difficult. The hilly country held at present by Colonel Norman's force, from which so many telegrams have come during the week, is bitterly cold in winter, and any working parties employed there will suffer greatly, even if they are so far unmolested as to render the attempt to work at road-making through the winter possible. But with the spring we may expect to hear that this part of the line has been so far improved as to enable wheel carriages to get up to the Cabul plateau. Telegraph communication will probably be kept up through the winter, with perhaps occasional interruption. It will be true economy to push on road-making and the advance of the railway within our own territories regardless of cost. It is only by means of good communications that the pacification of Afghanistan is possible, if it can be accomplished at all.

That it should be possible for a column only seventeen hundred strong to go out into Kohistan already, and to accomplish its errand of destroying Mir Batcha's fort without opposition, shows how quickly the late fermentation has subsided. As to the general situation, we must not suppose that we have seen the end of outbreaks. The Afghans will not stop fighting merely because they have no chance of success, any more than some people will give up wine because it is bad for them. Their nature is to fight with some one, and the English naturally will receive the greatest share of their attention. And very unprofitable warfare it will be, with the loss of many valuable lives. But there is no reason to suppose that the combination against us will ever be more formidable again than it has been now—or, indeed, anything like so formidable. But because we are strong enough to put down any attempts to turn us out of the country till we choose to go, it does not follow that there are not still difficulties to be overcome. Just now the garrison of Sherpúr will probably be usefully employed in strengthening their position. There can be no harm in making it a far better position than it is already, and our tendency in India is usually to be much too careless in matters of this sort, and not to take precautions enough; and there is a great deal to be done in the way of sheltering the camp followers and horses and transport cattle. The camp followers, poor creatures, are understood to be in a wretched plight just now. They started with the troops from the Kurrum Valley without any warm clothing, and there has been no means of getting up a convoy of such necessaries since. The Shuturgardan has been closed by the snow, and communication with Jellalabad has never been open for more than a day or two. The Sepoys and European troops are not too well provided either, but they have at least their great-coats and little tents; but the unfortunate camp followers are without either clothing or shelter. The mortality among this humble and useful, indeed most necessary, class last winter, in the advance on Candahar, is said to have been terrible; but then the campaign had not been foreseen, and there was no time to make preparation. The same excuse cannot be pleaded now, and some more information is very much to be desired as to what is the exact state of the provision made on this head by the Indian Government, both for troops and camp followers. The very last news from Cabul before the late uprising took the form of an appeal to the English public for warm clothing for the garrison. Even if the English public had responded at once, the supply could not have been sent out soon enough; but it would be thoroughly unreasonable and discreditable to the Indian Government, if it were necessary that its deficiencies should be supplemented by private charity. One thing was quite evident when Roberts's force set out from the Shuturgardan—that it would have to winter in Cabul. This was three months ago, so there has been ample time for the needful supplies of warm clothing to have been sent up to the front; and they should be now awaiting the first convoy into Cabul. If this has not been done, the troops will undoubtedly suffer a good deal this winter, although the climate if severe is fortunately very dry, and the loss will in any case be much less than often happens in an Indian cantonment from the summer heat; but the wretched camp followers—the grooms and litter-bearers and servants—will die off like flies. There is a very natural anxiety on the part of the public to know what the facts are on this head.

THE OLD YEAR AND THE NEW.

To have seen the last of 1879 is something to be grateful for on the whole. In whatever mood we choose to look at it, the past year was sour and unhappy. If we think of trade only as it affects the comfort and happiness of English families, we remember how 1879 began under the cloud of disgraceful financial failures, and how for three-fourths of its course business remained in almost hopeless stagnation. It is one of the good omens for 1880 and the new decade that the explosion of the swindles which brought professed benevolence and pietism into discredit seems to have purified the air and acted like that mythical phenomenon of the Lake district, the "clearing showers." We seem to begin the new year with some reason to hope that we have seen the worst of bad trade, and that even the commercial conscience has been awakened to a sense of the profitableness of honesty in the long run.

The greater events of the year have been, or ought to have been, of a "tonic" quality. Till more serious wars and more heavy losses come to put the past out of remembrance, 1879 will be remembered with keen regret as a year of wars which, though successful, brought little glory with their many sorrows. Probably there are few people in England who did not heartily regret the circumstances which in South Africa made us employ the deadly engines of civilization on a frank, manly, and courageous set of savages. In a fight with a European Power, a nation soon learns to detest its enemy, and to regard it as the embodiment of wickedness. Without some idea of this sort it is not easy to wage war with comfortable consciences. Our fathers had a holy hatred of France; when we encountered Russia we were sure that we were opposing a gigantic system of evil, and so far, war was not felt to be a moral misfortune. But neither English combatants in Africa, nor non-combatants at home, could manage to detest and abhor, nay, they could hardly even dislike, the Zulus. We all felt that war in this case was no sort of crusade, as old wars against despotisms or regicides seemed to be, but only a miserable game of chance and skill in which we happened to be engaged. This feeling only increased the grief with which the country mourned for a thousand gallant soldiers, many of them lads, and for more than a hundred officers many of whom had just left the public schools, while there were even some that fell who would have been young among schoolboys. They all faced death with a gay courage, as they would have faced a charge at football. One rode alone into the midst of an unknown country and a barbarous foe. Others shone in rescues of wounded men, in the face of overpowering numbers. One, who cast new glory on the ancient and honourable name of Hamilton, actually silenced by the terror caused by his single valour the gun fired by the Afghan soldiery against the walls of the English Mission. We saw last year some distributions of honours which were rather too blatant in character, and almost partook of the nature of advertisements. Yet, in looking back on a gloomy and sorrowful year, the memory dwells with pleasure on the names of those who held the little house at Rorke's Drift, and who defended the English Residency at Cabul, as staunchly as their grandfathers held the house of Hougoumont. It was one of the miseries of the past year, perhaps that which people felt most bitterly, that a foreign guest of our army fell unaided among savages through the momentary absence of that uncalculating courage which was so often displayed in 1879. The death of Prince Louis Napoleon was an event that must have saddened every one not absolutely perverted by political passion. The last act of an extraordinary political drama, which had drawn for two-thirds of a century the eyes of the civilized world, ended as strangely as the career of Charles XII. The hope of the adventurous family fell as suddenly as fell that adventurous king. The sorrows of a lady who has known the greatest vicissitudes of fortune became a matter of sincere domestic sympathy in England, as well as a topic for the effusions of the basest servility. Indeed the late year, with its many trials, did not find us a people who can accept misfortune with simplicity and dignity. A foreign observer said once, in very good English, that he "hated England because she was too d—d comfortable." When, for any reason, we cease to be comfortable, and learn that we are subject to distress and disaster, there are scores of noisy voices to discourse on the occasion in a most lugubrious whine. It is impossible to say how far the public lamentations represent a general despondency. If they do, this country has become too fond of crying and wailing, like the girl in the fable, over spilt milk and broken pots. Empires are no more kept together by commercial activity in the way of selling "sized" cottons and "realizing" large fortunes than revolutions are made with rose-water. We all trust that 1880 may be a much more fortunate year than 1879, that trade may improve, that the Boers may cease to trouble, that the Afghans may recognize their inability to cope with our arms, and that the sun may shine fair on heavy crops, gay garden parties, and "lively" lawn-tennis and cricket grounds. But if we cannot have all we want, if we are obliged to make sacrifices and exertions, we may at least remember that other peoples also, "being men, have endured things not intolerable." For all that human eyes can see, 1880 may be, like 1870-71, one of the solemn moments in the ages which try all nations as if with fire. The best public preparation for the year, whatever it may be, is the assumption of a stoical spirit and the disuse of political shrewishness. These things would be worth purchasing, even at a heavier price in the way of experience than we have yet paid.

The minor social phenomena of the past year have not been parti-

cularly encouraging to the optimist. In literature and art of every sort, for example, we have rather an empty record; like the shield of Sir Tor, it is "blank enough." Writers and artists have, as a rule, repeated themselves, and furnished some not disagreeable matter for indolent discussion. There is no certain sign of the approach of that much desired and long-expected person, the new man of genius. His place is quite ready for him, and let us trust that he will take it in 1880. It is high time that some good original work were done, something more permanent than praiseworthy manuals, meritorious primers, and agreeable volumes of travel. Perhaps the stage was last year the most fortunate as well as the most fashionable of the arts. The Shakspearian revival was popular and praiseworthy. People await, some with pleasure, others with unconcealed dismay, the second advent of Mlle. Sarah Bernhardt and of M. Coquelin.

There is some reason to hope that 1879 reached the low-water mark of cheap scandal-mongering. The social waters retreated at the command of some very cheap magicians, and revealed unlooked-for nastinesses. This is the most poetical way in which we can well say that society journals were sold for one penny. The consequences are fresh in the memory of all, and it is cheering to know that penny slander and scandal at least, and the lies and obscenity of the stupider craftsmen in the pandering trade, can be stamped out by the law. We even seem to detect signs of an abated interest in the reports of the doings of fashionable women which are circulated by industrious touts. It would be pleasant to believe that 1880 may be less prone to tattle and libel than was 1879. But it must not be forgotten that the habits of all animals excite least interest in the season of hibernating. 'Arries of all classes will probably pursue, with keen scientific interest, the lovely ephemeræ of the season in summer. As to libels—in which the past slanderous year was so rich—it is not unlikely that they have done their business. It is sometimes found desirable, by drunken and indigent tramps in want of a shelter for the night, to call public attention to their existence by breaking the windows of some harmless tradesmen. Windows enough of the figurative sort have now, perhaps, been broken by libellous writers. The public and the police are quite awake to the existence of the class, and by the operation of economical laws the new year may be delivered from the scandals of the old. It was a reprobate, ill-humoured, unlucky year, worse than the old profligate who boasted that he "had been known to be steady for weeks." There were but few weeks in 1879 that did not bring news of a misfortune, rumours of war, of desolating storms, news of disgusting scandal, or tidings of the vilest murders and outrages. The most loathsome of these were the Euston Square and Richmond "mysteries," and it is not very much to the credit of the police that 1880 finds the murderous centre of the former abomination a mystery still. The occurrence of such crimes is less discreditable to society than the widespread interest which they generally excite. It would be too sanguine to hope that 1880 will lack its murders and its "sensations."

The end of the year finds the world's stage cleared of many conspicuous figures. Probably more notorious or celebrated people have departed than there have been discovered new celebrities to fill their places. That of the Prince of Orange will long remain unoccupied; at least it is unlikely that many royal persons will think Paris well worth a crown, a life, and honour. The death of Lord Lawrence makes a great gap in the Anglo-Indian world, and the murder of Sir Louis Cavagnari removed a man for whom it will be hard indeed to find a substitute. More familiar names and figures were those of Mr. Roebuck and Mr. Butt. The House of Commons is scarcely the same place without them, while literature seems altered in many ways by the deaths of Mr. John Blackwood, Mr. Hepworth Dixon, and Mr. Dana. The world of art has lost an eminent historical painter in Mrs. E. M. Ward and in M. Viollet-Leduc, a learned and accomplished architect and writer on architecture and other art subjects. Buckstone and Fechter have disappeared from the stage. Dean McNeil was a representative man in the Evangelical party in the Church; and Canon Ashwell, of a widely different school of opinion, has left his unfinished work to be given to the world by other hands. We are reminded that we are living in a new generation, studying a new page of the world's history, when many of the old and strenuous actors have passed away. "Changed faces, other times," seem to come with the beginning of a new decade, of which at least one hopeful omen is the success of English arms in the East. A new House of Commons will perhaps be one of the novelties of the year; but change is not always improvement. Will 1880 soften the manners of Irish members or diminish the habit of bringing railing accusations? Alas! however Mr. Parnell may begin the new year, Mr. Bright has ended the old one in the manner of Hogarth's controversy with Churchill. We must "nurse no extravagant hopes" in "this so-called nineteenth century."

DR. RICHARDSON AND HIS WINE.

THE case of Dr. Richardson, as reported by himself in the current number of *Macmillan's Magazine*, affords by far the most persuasive argument in favour of total abstinence that has yet been offered to the public. Rewards and not punishments are often, after all, the most powerful incentives to virtue. There are a vast number of persons who are ready to scoff at the warnings of doctors, and who can even laugh to scorn the terrors of gout so long as they are left in peace with port wine of a certain age. Their rebellious spirits are neither subdued by the thunders of the temperance lecturer nor charmed by the alluring humour of Sir Wilfrid Lawson. They are, in fact, such hardened sinners that we doubt whether Dr. Richardson himself could tempt them to his ideal city, even though he should offer for their consumption water of a sparkling purity undreamed of even by the ruthless Corporation of Manchester. They have long ago taken their own precautions against the fearful creatures revealed to us by the microscope, and it may be questioned whether the modern researches of science have done more than strengthen their attachment to good wine. But even the worst of these offenders might, we think, be won over to the side of virtue by the contemplation of Dr. Richardson's good fortune. If a famous cellar of old wine could be counted upon as the sure reward of abstinence, temperance would command a powerful following. For the sake of such an inheritance many of the staunchest advocates of alcohol would gladly take to water for awhile. Petitions in favour of the Permissive Bill would flow in from every side, and ruby-faced old gentlemen would vie with each other in favour of a cause which offers to its supporters such a pleasant reward. Even as it is, we may confidently look for a considerable increase in the number of teetotalers. Enthusiastic praise of milk and water will become a fashion with men of delicate and curious taste, for although there may not exist many cellars in the country so richly stocked as that of the late Sir Walter Trevelyan, every connoisseur of old wine will cherish the hope that to him also shall descend a like bequest of sack and Cyprus.

In the meantime, the strange predicament in which Dr. Richardson unexpectedly finds himself cannot fail to cause a certain measure of anxiety to his friends. For the moment this excellent gentleman is completely surrounded by bottles and magnums of curious brands. He is hedged in on all sides by a formidable array of subtle and alluring liquors, so that the hearts of his faithful followers must sink within them as they reflect upon the perils to which he is exposed. St. Anthony himself was not more sorely tempted. Nor are there any of the knights in Spenser's poem who can be said to have encountered a more redoubtable foe. There is nothing, so far as we know, in the past conduct of Dr. Richardson which can be held to explain the trial to which he has been suddenly exposed. For years past he has been known to the world as a blameless and energetic officer in the great temperance army, and by nothing that he has done can he be held to have deserved the sudden interposition of avenging fate. What has befallen him only shows how idle it is to regard every individual misfortune as a special judgment. Without the slightest swerving from the path of virtue poor Dr. Richardson suddenly finds a cellar key thrust into his hands. Opening his letters one morning at breakfast, and dreaming the while, as we may suppose, over that land flowing with milk and water to which he has given the title of Hygeia, he lights upon a communication from one of the executors of the late Sir Walter Trevelyan. From this brief note he learns, to his astonishment, that the deceased Baronet, by a codicil to his will, had bequeathed to him all the wines in the cellars at Wallington. We know not to what spiritless cordial total abstainers have recourse to nerve them under the pressure of sudden trial; but we may conclude that the good Doctor, staggering under this unexpected misfortune, took a deep draught of some innocent vintage of Hygeia. Even the bravest man may be taken unprepared; and for a teetotaler to be endowed without warning with the contents of a famous cellar is a fate that must command the sympathies of all tender natures. But Dr. Richardson, to do him justice, seems never for a moment to have lost heart. The letter arrived on the first day of the month of April, and for a while he did indeed believe himself to have been the victim of a cruel joke; but in due time a parcel, containing the key of the cellar, arrived by registered post, and the poor Doctor was left to confront his destiny with all the courage he could command. Never, to be sure, was such a cruel testamentary blow more entirely unprovoked. Dr. Richardson and the late Baronet were almost total strangers. They had only met once or twice, and in public places, and, save for the virtue of abstinence, and a combined desire for the welfare of mankind, they would seem to have had but little in common. But the mere fact that the deceased was also a teetotaler renders this strange codicil only the more difficult to interpret. Why, it may be asked, should a humane abstainer seek to test or to strain the virtue of his brother? It was enough surely that one luckless mortal should have passed a life of painful probation with the key of a magnificent cellar in his hand; it was scarcely necessary that the burden of temptation should descend upon other and more innocent shoulders. More innocent, because there is a certain fitness in the fact that Sir Walter Trevelyan should expiate the sins of his ancestors. To them belongs the iniquity of having stocked the vaults at Wallington with these curious vintages; but as neither Dr. Richardson nor his family had any part in the original crime, it was somewhat hard that he should be now compelled to suffer in the cause. It is very much to the Doctor's credit that he does not, as far as can be judged, harbour any resentment towards the deceased. He would seem to accept in perfect faith the wording of the will by which the wines are directed to be "applied to scientific purposes," and he now comes confidingly before the public in the hope perhaps that his pitiful story may call forth some suggestion to guide his conduct.

At present the luckless legatee is apparently ignorant of any

scientific purpose to which wine can be applied. That it can have been intended to be drunk is of course out of the question, and yet, short of drinking it, there would seem to be no opportunity for the exercise of scientific ingenuity. The waiter in *David Copperfield* thought that table-beer could be swallowed with impunity if the head was thrown back, and if the draught was sufficiently deep. But Dr. Richardson is evidently not disposed to put faith in any such precaution. He denounces those pretended friends of the human race who have countenanced the notion that port wine is good for neuralgia, and he has so far turned a deaf ear to all propositions for the disposal of his bequest by way of consumption. If he were not quite so firm upon this point, there would perhaps be a better chance of satisfying the wishes of the testator. Some one from among the elect could surely be found who would be ready to sacrifice himself for the good of the cause in order to prove to an incredulous world that even the finest wines are no more than a noxious poison. The interests of science could not fail to benefit by the experiment. The patient would be submitted to the closest and most careful observation, and his changing symptoms as he was successively subjected to the influence of each curious wine would afford new material for a comprehensive history of disease. There is, of course, the possibility that the experiment might not succeed. If, after all the varied contents of the cellar had been exhausted, the victim still survived, Dr. Richardson and his friends would no doubt be placed in a most humiliating position. But a good and earnest teetotaller might be trusted to know the right moment to succumb, leaving the scientific operator to point the moral of his fate. Unless Dr. Richardson accepts some such suggestion as this, it is difficult to see how he can discharge the trust that has been confided to him. Merely to defend his own virtue against the insidious attacks of Malmsey or Tokay could not exactly be accounted a scientific achievement. So long, of course, as the wine remains in his possession, it must be regarded as a source of danger to the whole fraternity. For, although men of exceptional strength of will, like the late Sir Walter Trevelyan and Dr. Richardson, may pass through such an ordeal with unimpaired reputation, there is no sort of security that the contents of the cellar will not one day fall into the hands of some frailer creature. It is not every teetotaller who is to be trusted with the keys of a valuable wine-cellar, and we trust therefore that Dr. Richardson will not again run the risk which the deceased Baronet was rash enough to incur. It is impossible altogether to resist the conclusion that the late owner of the Wallington cellars was after all something of a humourist. The notion that Sir Wilfrid Lawson is the only comic genius subsisting entirely on water is perhaps unsound, and we can imagine Sir Walter Trevelyan grimly chuckling over his codicil, and picturing to himself with awful merriment the eventual embarrassment of his temperate legatee. Never assuredly was a practical joke so gravely carried out, and a man must indeed be a humourist who is content thus to provide the material for posthumous laughter. Nor, short of the painful experiment we have already suggested, does any means occur to us by which Dr. Richardson can extricate himself from his ludicrous position. There is a story of a Royal Academician whose modest feelings were so shocked by the subject of a cartoon by Michael Angelo in the possession of the Academy, that he one day had the audacity to suggest that it should be sold. The inconsistency of such conduct was too manifest to escape detection, and Dr. Richardson, although he is equally shocked at being the possessor of a cellar of wine, would never dream of allowing others to indulge a taste which he denies to himself. What he desires, if we understand him, is to find some simple person willing to pay the full price for the wine on the express understanding that it is never to be consumed. If he realizes this innocent dream, he will apply the proceeds to some scientific research in which he "might be usefully engaged." But we would suggest that at least a portion of the proceeds should be devoted to the erection of a temperance monument in which Dr. Richardson, balanced like a skilful acrobat upon the apex of a pile of bottles, should be represented holding with resolute grasp the key of the Wallington cellars.

BERKELEY CASTLE.

"IT is a reverend thing," remarks Lord Bacon, "to see an ancient castle or building not in decay; how much more to see an ancient noble family which hath stood against the waves and weathers of time?" Both these objects of reverence meet at Berkeley, in Gloucestershire, and of eight important Norman fortresses which formerly sentinelled the border of the Severn from Shrewsbury to Bristol, only Berkeley Castle now stands. The circumstances of the foundation of that stronghold are less open to dispute than the question of the first coming into England of the family who seven centuries ago built its principal walls. Were it not as difficult to get rid of a fiction as to grasp a fact we might be surprised that the Rev. J. H. Blunt, the historian of *Dursley and its Neighbourhood*, should have recently repeated the mythical statement that Robert FitzHarding, who erected the keep, was the grandson of a Danish King. To which King of Denmark Prince Harding claimed sonship does not appear, but it is explained that the reason of the royal progenitor of the Berkeleys taking up his abode in England was obedience to a national law that, to prevent a strife for the succession to the Crown, a younger son, which he himself was, should be sent into a foreign country. As the House of Denmark supplies no evidence of the descent in question, we may leave the matter in doubt, or we are open to accept the suggestion of the Rev. S. Seyer, supported by Mr. Freeman, that, in the words of the latter, "Robert FitzHarding, the patriarch of the house of Berkeley, was son of a Harding whose name often occurs in *Domesday* and elsewhere, and grandson of Eadnoth the Staller, a man who, having been a great officer under Edward and Harold, passed after the Conquest into the service of William." Even if as destitute of pedigree as Melchisedec, we have proof that Robert was an historical person. Among the muniments of the castle is an original charter by which Henry, Duke of Normandy, afterwards Henry II., grants to Robert, son of Harding, land at Berkeley for the yearly service of two falcons, and promises to build him there a castle according to his own mind ("Et pepigi ei firmare ibi Castellum secundum voluntatem ipsius Rodbti"), Robert engaging in return to be Henry's vassal. A second charter from Prince Henry confirms this grant for the additional service of a knight's fee, or, if preferred, a hundred shillings yearly. It is stated, moreover, by Gervasius (X. Script. I. col. 1358) that Henry, when a boy, was placed under the tutelage of Robert FitzHarding at Bristol, and during four years was there taught the arts of learning and conduct by a tutor named Matthews. This story has been questioned, it seeming the more suspicious from having been generally omitted by the mediæval chroniclers. The first of the charters, however, referred to above is dated at Bristol, and both are attested by the Abbot of St. Austin's at that place. Also in a charter printed in Dugdale, which Henry II. granted to the Abbey of St. Austin's, Bristol, the King speaks of that convent as one which in early life he had aided by his benefactions and protection ("Quam inicio juventutis meæ beneficiis et protectione cœpi juvare et fovere." Dugd. vi. 365). FitzHarding was the founder of St. Austin's, and a fifteenth-century inscription over the existing Norman gateway affirms that Henry II. was joint builder with him of that monastery. The association between the son of Harding and the son of Henry I. is therefore evident, and shows that the former was a man of consequence, if not a Royal Dane.

Before Robert FitzHarding became owner of Berkeley, that barony belonged to Roger, Lord of Dursley, who was deprived of his estate for his loyalty to King Stephen. To lessen the injury to the ejected lord, who had taken up arms in self-defence, Henry helped to arrange a marriage between Helen, daughter of FitzHarding, and a son of Roger de Berkeley; also between Alice, daughter of Roger, and Maurice, son of FitzHarding. The old Berkeleys then quietly retired to their manor of Dursley, where they died out in the male line in 1382, while the FitzHardings, with the lordship or honour of Berkeley in their possession, which covered most of the hundred, took the surname of the estate, and continue to be one of the few families whose heads by male descent have been barons of the realm by tenure or by writ (tenure having fallen into disuse in the reign of Henry III.) from the time of Henry II.

Mr. G. T. Clark, in a recent examination of the castle, pronounces the half-hollow circular keep, which is unusually large, to be based on a Saxon mound fortification. For twenty-two feet of its height this important tower encloses a mole or column of earth which he argues was not likely to have been filled into the shell of masonry, holding rather that the Norman builder, finding a moated mount of suitable dimensions, adopted it for the solid core of the keep by building around it a revetment wall, as at Pontefract, and raising on the wall the present curtain. Placed at the extremity of a tract of land that suddenly drops from the southern walls of the fortress into a flat meadow which extends to the Severn, a mile to the west, the station was one of obvious importance against irruptions from the Welsh borders. After the battle of Deorham (A.D. 577) the whole valley of the Severn was delivered into the power of the West Saxons; and that Berkeley was an entrenched position against the Britons who had been driven to their hills across the Severn and Wye may be argued as well by Mr. Clark's theory as by the fact stated by Smyth, the historian of the Berkeleys, that in his day (A.D. 1620) traces remained of an early mound and fosse. The positions that had formed the most available points of defence to the Saxons would naturally offer the same advantages to the Normans, for the Welsh were not less aggressive in the days of Rufus than in the days of Ceawlin.

Entering the outer ward we are confronted by the western half-round of the huge keep, which has the gateway of the inner ward attached to its southern face. Passing into the second court we find on the right the domestic apartments, which, though structurally Norman, are pierced with Tudor windows. In front are the great hall, buttery and kitchen, while on the left are the miscellaneous offices. All these buildings are attached to the Norman curtain, or buttressed outer walls of the castle, and are as skilfully designed for convenience as for security, while to enhance domestic privacy there are distributed within the halls and towers concealed apartments enough to form the architectural type of some *Mysteries of Udolpho*. Except on the north angle which is occupied by the shell keep, a feature that is in marked distinction from the usual massive rectangular tower, the external form of the fortress is a rude square of an average extent of sixty-seven yards on each face. The keep is about fifty yards in diameter, with walls eight feet in thickness. The exterior height is sixty-two feet, but one third of the shell being filled with solid earth, the access from the courtyard is by winding steps which land the visitor on a grass-plat twenty-two feet above the level of the wards. Here we

find practically a third court, the domestic apartments being on the southern concavity of the keep against the inner gateway. Projecting at irregular intervals from the exterior circuit are three segmental bastion turrets about twenty feet in diameter at the broadest parts. Two of these towers are hollow downwards from the keep platform to two feet below the level of the wards, one of them being the ancient prison-hold. Into this black den, deeper than the Tullian dungeon and as noisome and terrible, were thrust some of the captives of King John when he, in 1216, seized the castle. Edward II. was immured in the guard chamber immediately over this fearful hole. The family banner is planted on what is known as the Thorpe Tower, which is a rectangular building, also like the bastions attached to the keep, but on the northern part of the circuit. The estate of Wanswell Court, a mediæval house in the neighbourhood, was held by the family of Thorpe on the tenure of defending this tower.

The Berkeleys have been men of war, though not illustrious warriors like the Talbots, Percys, and Howards. They have at least been more fortunate than some of these, none of the lineal barons having perished on the scaffold or on the field of battle. This is the more remarkable because, while usually taking the side of the people in political movements, they have been active in treasons, rebellions, and regicidal conspiracies, as well as in domestic and foreign wars. Robert FitzHarding died a canon in the Augustinian abbey that he had founded, being the first and last monk of his line. Maurice, his son (ob. 1189), conceived less regard, and not unreasonably, for the monks whom his sire had favoured. Having dug a ditch on the north side of the castle, he encroached upon the adjoining churchyard, which his father had given, together with the church, to the black canons of St. Austin. This sacrilegious act so excited the brotherhood that until full restitution was made they spared towards the offender no divine anger short of excommunication, and that they threatened. The third lord, Robert II., was actually excommunicated by Innocent III. for siding with the barons against King John. His castle and all his lands were at the same time confiscated, and the revenues ordered for the maintenance of the royal stronghold at Bristol. Some of his estates were afterwards restored to him, but not the castle and town of Berkeley. These, however, were in 1224 given back to the family by Henry III., who accepted as hostages of fidelity two nephews of Thomas, the son and heir of the deprived lord, Thomas then taking possession of the castle. Maurice, the next in succession, entertained Henry III. at Berkeley in 1256, at which period the "household and standing domestical family consisted of 200 persons and upward." The eldest son of Maurice was killed at the jousts held at Kenilworth in 1279, which were celebrated by Roger de Mortimer, who proceeded thither "with 100 knights well armed, and as many ladies going before singing joyful songs." Thomas, who succeeded, was at the battle of Evesham (1265), at the famous siege at Calaverock (1300), and likewise at the battle of Bannockburn (1313). Maurice III., the seventh lord, had the nearest approach to a violent end, being seized by Edward II. and thrown into Wallingford prison, where he died (May 1326), for having taken part against the two Despencers. Thomas, his brother, the next of the line, also offended the King by harrying the lands of the same favourites. He was consequently sent to the Tower, whence escaping and being retaken he was immured in Pevensey Castle till his captivity was ended by the captnre of the King himself. While taking refuge at Tintern Abbey (October 14 and 15, 1326) Edward had given the custody of Berkeley Castle to Thomas de Bradstone; but the growing power of Isabella and Mortimer soon reversed the act. Within the next twelvemonth the wretched monarch made his own awful acquaintance with the towers of Berkeley. He was committed to the custody of Thomas de Berkeley, who had an allowance of 5*l.* a day for his expenses, the castle steward's accounts of the time showing that the two sums of 700*l.* and 500*l.* were received from the Exchequer for the maintenance of the King and his attendants during his whole imprisonment. But Lord Thomas showed too little resentment for his own injuries, and, being thought to treat the Royal prisoner too gently, he was commanded to deliver him, together with the castle, to Lord Maltravers and Sir Thomas Gournay. "Ser Thomas Berkeley," says Capgrave, "had the keeping of him a month, and treted him ful worschipfully; and Ser John Mauntravers had the keping of him two othir month, and treted him ful ongentyly. The quoen sent him pleasant giftes, and clothis ful precious; but sche wold not so him. Sche pretended that the lords would not suffer her." This passage of Capgrave seems to be the basis of the powerful death-scene in Marlowe's *Edward II.*, a drama which, at least in this part, is grounded on a careful study of the historical facts. The room in which the foul deed was committed which gives the castle its tragic celebrity was doubtless the chamber over the dungeon, and not the guard-room to the entrance of the dungeon keep, as generally received. The former view is supported by Mr. Grantley Berkeley, who has judiciously argued the point. The fretted marble tomb of the murdered monarch in St. Peter's Abbey—now the cathedral—Gloucester, is a shrine for a saint, and indeed to the monks Edward proved the Thomas à Becket of the West, the oblations of pilgrims in the course of fifty years at his sepulchre being enough, it is stated, to have rebuilt the church, had the work been needful. The historical parallel between the end of Edward II. and that of Darnley, whose weakness was their ruin, lasts beyond the murder in both cases. Before a month from the assassination of her husband Mary Stuart was amusing herself with archery at Lord Seton's with Bothwell and the other noblemen who were chief accomplices in the tragedy. So in the Berkeley Household Accounts (as supplied by Mr. J. H. Cooke, F.S.A., the present land steward) there is an entry of 31*s.* 1*d.* for the expenses of the red-handed Thomas de Gournay going to Nottingham to inform the Queen of Edward's death, the gentle Mortimer being no less pleased than under like circumstances was Bothwell at a later day to hear that the deed was done. Lord Berkeley was tried, but finally acquitted of complicity in the murder of the King, and lived to serve with his son Maurice in the battle of Crecy and Poictiers.

Thomas IV., the tenth Lord Berkeley, figures in Shakspeare's *Richard II.*, where he is represented as meeting Bolingbroke and Northumberland on his own territory, whither they had come over the Cotswold from the North after the landing at Ravenspur of the King that was to be. The Duke of York was already at Berkeley, awaiting, Hollingshed tells us, the arrival there of Bolingbroke, "whom when he perceived that he was not able to resist, on the Sunday after the feast of St. James, he came forth into the church that stood outside the castle, and there communed with the Duke." In the existing church, a rich example of Early English architecture, Richard's doom was sealed. With the Duke of York, the same historian asserts, were the Bishop of Norwich, and Lords Berkeley and Seymour; with the Duke of Lancaster, Thomas Arundel, Archbishop of Canterbury, the Abbot of Leicester, the Earls of Northumberland and Westmoreland, the Baron of Greystoke, the Lords Willoughby and Ross. Though Hollinshed has neglected to mention the presence of Hotspur, Shakspeare has remembered the historian's previous statement that Harry Percy, together with his father, had joined Bolingbroke in the North. The poet, however, takes the liberty of making Percy and Lancaster meet for the first time in their lives at Berkeley. On their greeting the latter thanks his "gentle Percy" for his tender of service, and promises to remember him as his "fortune ripens." In *Henry IV.* (First Part, Act I. sc. iii.) Hotspur, who had become that King's enemy, recollects the whole scene, but affects to forget the place of its occurrence, except that it was in Gloucestershire. Northumberland suggests that it was "at Berkeley Castle":—

> *Hotspur.* You say true,
> Why what a candy deal of courtesy
> This fawning greyhound then did proffer me!
> Look—*When his infant fortune came to age.*
> And—*Gentle Harry Percy; and Kind Cousin.*
> O the devil take such cozeners.

The marriage of Thomas, fourth of that name, to Mary, daughter and heir to Gerard Warren, Lord Lisle, occasioned a remarkable family feud, which finally resulted in a sanguinary battle between the female and the male representatives of the race. His only child was Elizabeth, wedded to Richard Beauchamp, Earl of Warwick; who, on her father's death in 1417, set up a claim to the castle and all the connected manors, in which assertion she was of course supported by her husband. The collateral heir by entail was James, the son of James the brother of the late lord, who in 1420 besieged the castle in order to oust the usurping Earl and Countess of Warwick. In alternate successes and reverses on either side the castle was several times taken and retaken, while the town of Berkeley was half destroyed. At length—in a later generation, 1469—the young Viscount Lisle, the last of his line, challenged William, Lord (the twelfth) Berkeley, to fight with their retainers on Nibley Green. At sunrise on the 20th of March the combatants met to the joint number of over a thousand strong, the rude miners having poured from Dean Forest to assist Lord Berkeley. While lifting his vizor Lord Lisle was shot in the face by an arrow aimed by one Black Will, a forester, and was finished by a dagger stroke. This caused the rout of his followers, but not an end of the contention, at least in a legal form.

A later attempt in another way to dispossess the Berkeleys of their principal estate was made by Robert Dudley, Earl of Leicester, who had already secured Wotton, one of their manors. Leicester persuaded the Queen on her western progress in 1573 to hunt Lord Henry Berkeley's red deer in the castle park. Berkeley at the time of Elizabeth's visit was designedly absent, which perhaps caused the more wholesale destruction of his game, twenty-seven stags being killed in one day. Soon after her departure information through the favourite reached the Queen that Lord Berkeley had shown strong feelings of resentment at the wanton outrage on his preserves, which so affronted her that she sent a message to him to be careful of his words, for that the "same earl" who had plotted against his deer might plot also against his castle and his head, to the former of which he had taken great fancy. On the whole, the Berkeleys had little reason to say "God save Queen Elizabeth," a fact of which Elizabeth herself was not unconscious. Lord Henry Berkeley married the sister of Thomas Howard, Earl of Norfolk, and soon after the execution of the latter Lady Berkeley presented a petition on her knees to Her Majesty, who replied, "No, no, my Lady Berkeley, we know you will never love us for the death of your brother."

We get some idea of the stately household of this Lady Berkeley from a code of rules, A.D. 1601, "set down by my lady to be observed by the gentlemen" of the household, which is printed in the Fifth Report of the Historical Commissioners. These directions were to remain in the care of the gentleman usher, "that every one of the gentlemen may at any time resorte to the gentle-

man usher, and such as can rede may here see from time to time what those orders bee." Among the usher's duties was to see that the yeomen in the summer-time trimmed the chimneys "with grene bowes and the windows with herbs and swote flowers, and the chambers strowed with greene rushes." If any visitors to the family were present, even one only, the gentleman usher and his co-mates were to wear their livery coats and to "kepe moste in the dyning chamber to make show of themselves both for the honor of my lord and me." No stranger was to be entertained at the castle "under the degree of an esquier of an hundreth pounds a yere of inheritance at the least." One regulation was that none of the waiting gentlemen were to go out of the castle after nine at night.

Every ruined or injured building in the kingdom, whether monastic or military, seems stamped with the name of Cromwell; and a touch of his finger is to be seen in a large gap on the north side of the keep of the present fortress. Both the castle and the church outside the castle walls were garrisoned for the King, under the command of Sir Charles Lucas. That officer, on being summoned (September 23, 1645) by Colonel Rainsborough, replied he would eat horseflesh, and, if necessary, man's flesh, before he would yield. He ate neither; but he did better—he yielded when it was useless to withstand. The church was first forced by the enemy, and forty men were killed. This important outwork having failed, and the besiegers beginning to plant their ordnance from the church roof, which commanded the area of the castle, the Governor sounded a trumpet for parley. Terms being arranged, five hundred horse and foot marched out from the gates, eleven pieces of ordnance and six months' provisions falling into the enemy's hands.

Since the Rebellion the castle has been as secure as a church from outward molestation; though, like a church in the larger sense, it has not been without its internal dissensions. The famous "Berkeley Peerage Case" need not, however, be noticed here. There are better things to remember. The Berkeleys have been the great church builders of the West, and their heraldry is emblazoned in the windows of literally a hundred ecclesiastical buildings which they have erected or benefited. The expensive, though judicious, restoration of the fine Early English church of Berkeley shows that the present Baron Fitzhardinge has some of the ecclesiastical spirit of his ancestors.

TWO NIGHTS AND A BALL.

We are inclined to think that those clergymen are most popular who preach a great deal about "fulfilling the duties of our station," which is currently interpreted to mean having as much fun as we can and entertaining as much as we can afford. The faithful devotees of this school of thought are chiefly occupied at this season of the year in fulfilling engagements at country houses for two nights and a ball, or receiving their friends for the same time and object. Nor are their labours in the pious fulfilment of these duties by any means light, their unwearying activity being only equalled by the length of their sleepless vigils. Their dietary, if not exactly ascetic, is decidedly severe and trying; and they do not flinch from sacrificing their health in the good cause, although they may not be specially addicted to bodily mortification.

The primary difficulty in paying a visit to a friend's house for a couple of nights and a ball is to get there. At such times it is unusual for one's host to send to meet one; and, as a rule, the larger the house the less likely is one to be conveyed there in the carriage of its owner. In country places there is often but one ball a year, and then every available house is filled for it. The consequence is that every fly in the neighbourhood is ordered several times in the day, and that there is generally considerable confusion about these orders. It often happens that only two flys appear at a station to take to their destinations three married couples, with their maids, footmen, and piles of luggage, and perhaps a couple of bachelors. If they all happen to be going to the same house, even if everybody and every package cannot be conveyed in one journey, there is nothing but civility and unselfishness; but when the travellers are bound for different quarters, there is sometimes a polite wrangle about the right to a fly. In nine cases out of ten, one of two things happens on arriving at a country house. One either gets there too early and has to endure the agonies of boredom of a very aggravated type for two or three hours before dressing time, or else one arrives in a bustle and a hurry a few minutes before the dinner hour. In the latter case there has been scarcely time to get warm and rested after a cold journey, and to eat one's dinner, before the word is given that it is time to start for the ball. After dinner, and a glass or two of wine, most men are less inclined to bestir themselves and turn out of a comfortable house than at any other moment of the day, and a long cold drive in a tightly filled omnibus is scarcely conducive to digestion or good spirits. On reaching the scene of dissipation we part with our great coat and hat, not without misgivings as to when, if ever, we three shall meet again, and we find ourselves among a number of men struggling into kid gloves. But the plunge must be made, and we must enter the ball-room appearing blithe and gay, and concealing every semblance of a wish to be elsewhere. We are, as it were, under orders to be happy, so we must make the best of it.

This is the season of the year specially devoted to the being commonly known as "the dancing man." He is sought after by eager hosts and hostesses in all directions. Every post brings him several tempting invitations. He is fed upon the best of food and the driest of champagne. He shoots tame pheasants by day and dances with beautiful and other women by night. What good does the best education do for a man unless he can "dance divinely," as young ladies put it? What arts and sciences obtain for a man so many invitations or so much popularity? Call the dancing man a conceited puppy, if you will; but have your more intellectual pursuits procured you so many visits to great houses or so much champagne as the nimble antics of this creature whom you despise? It is all very well to cry, "Away with the great houses and the dry champagne"; but, if you do not care for these things, the dancing man does; and in a free country we must allow every man to have his own tastes. At this season the dancing man discovers his worth and gives himself airs accordingly. He thinks nothing of keeping a countess waiting a week for an answer to an invitation, in hope of being invited by a marchioness. Let him marry, and he will soon find that his charming society will not be nearly so much sought after. Next to the dancing men the most necessary person in a party for a ball is a beauty. Professional beauties are treasures to which but few aspire, and there are different opinions as to their desirableness in a country house; but most people like to have one or two pretty girls among their guests who may be spoken of as the prettiest girls in the ball-room. Except to dancing men and bachelors, beauties are apt to be a bore. At a country house at which we were lately staying, we heard one guest on arriving ask a friend whether he had seen a very handsome girl who was one of the party. "Yes," replied he, "I saw her at the station, and perceiving at once that she was a beauty, I lost all further interest in her." There is one advantage, however, about a beauty, which is that, if one asks her to dance, she is pretty certain to be engaged.

One of the first ceremonies of a country ball is the weighing anchor of the chaperons. They like to be near "nice people," and they sometimes find considerable difficulty in steering themselves into favourable positions. There are parts of the room, too, where the elderly gentlemen congregate, and throughout the evening there are usually one or two clusters of wicked young men who ought to dance but will not do so. Why they have come to the ball at all it would be hard to say. Was it for this that their hostesses angled for them with such consummate and untiring skill? Many givers of private balls in the country lead eligible bachelors into temptation by arranging quiet rooms with newspapers and magazines. A certain hostess, on returning to her house, appeared to derive little or no gratification from the assurance of one of her guests that he had never enjoyed a ball so much in his life before. This guest had spent the entire evening, except when at supper, in a small room, lighted only by reading-lamps, perusing the best-known monthlies and weeklies. The ostensible object of ball-going is, however, to dance, and not to indulge in literature; nor can it be said in these days that the exercise of dancing is much neglected. Twenty years ago people walked through quadrilles and lancers, and slid gently when they waltzed or galloped. In fact, dancing was reduced to the merest form, and the slightest approach to dancing, in the old-fashioned acceptation of the word, was regarded as extremely vulgar, if not absolutely barbarous. It was all very well for naked savages or servant-girls to caper and pirouette, but such performances were perfectly inadmissible in polite society. The first innovation on this happy state of things was the introduction of what are known as "sixteen-lancers." At first there was considerable protest against this new custom. It was argued that, although permissible at small private dances, such a riotous performance was quite unsuited for a public ball. But what was this riotous dance compared to the sixteen-lancers of the present day, whether in public or private? If there was one thing that was considered more intensely vulgar than another, fifteen years ago, it was a polka. People in society would scarcely have dared so much as to mention its name. It is now one of the most popular dances at a country ball. After all, the most vulgar old polka was comparatively inoffensive. The dancers hopped about energetically, it is true, but their action was rather perpendicular than horizontal; now, on the contrary, they jolt about on a plane, with a spasmodic and eccentric motion. It is considered decorous to bound backwards from one end of the ball-room to the other with a series of hops, skips, and jumps. If the hands of a pair of dancers are forced into the face of an unfortunate lady, it is an accident that does not even require an apology, and if tender corns are trodden upon and dresses torn, it is all a recognized part of the entertainment. The climax of modern dancing, however, appears to be attained in the Highland Schottische, a dance hitherto unknown in Scotland. The principle of this performance is as follows. The couples spring about in a wild polka, and whenever the spirit moves them, they separate and hop about on their own account until they feel inclined to dance together again. In order to enliven the proceedings still further, yells and hoots are given at irregular intervals by the dancers. We do not know whether it is attributable to the rage for "culture" at the present time or to the increase in the number of intellectual publications; but from some cause or other country balls have in many cases degenerated into romps which would not be tolerated in a servants' hall, and could scarcely be exceeded by an Indian war-dance.

We must not omit to mention an incident without which a ball

would be considered slow. When a waltz or polka is at its full violence, a lady's train becomes entangled in a gentleman's legs and ties them together. As he is dancing at full speed, the upper part of his body is propelled forward while his legs remain stationary, bound up in muslin, and down he comes, in all probability dragging his partner with him. It is not unlikely that the owner of the dress which has been the cause of all the mischief will be pulled down also. It may be some relief to turn away from such scenes and take an old lady into supper. Having already sat on the same seat for a couple of hours, and having still some three hours to endure on her perch before leaving the ball, she will feel it a great relief to go to the supper-room for five or ten minutes. Give her lobster, jelly, and champagne, and she will dream, let us hope, of your charity. When the supper-room is full there is more leisure to observe the varieties of style adopted by the dancers. One man waltzes with his head in the air, and much the expression worn by a dog when he is howling at the sound of music. Another has a bend in the middle, which looks as uncomfortable as it is ungraceful. One genuflects at every turn, and slides out one of his feet as if to trip up rival dancers. An even more dangerous performer works his left hand up and down as if it were a pump-handle. A tall man with a top-heavy kind of stoop leans over his partner like a great hen taking a chicken under her wings. One man holds his partner as if he were afraid she would slip from his grasp; while another looks as if he wished he were rid of his bargain. It is as the ball-room becomes gradually empty that the most furious dancing begins, and when only three or four couples are left, their movements more resemble gymnastics or acrobatic feats than dances.

After a long and weary drive home in the dark, and another supper, most people are glad to go to bed, but there are generally a few men of the party in a country house who will adjourn to the smoking-room for an hour, even at four or five o'clock in the morning. When your short night is ended, you have to make a choice of evils. If you come down early you will have to sit through a protracted breakfast, lasting an hour or more, as one person after another appears, and if you are late you will find lukewarm food and weak tea. There is probably shooting or skating on the day's programme for those who are thus inclined, and you may get what is known as a "gun-headache," if you have not already got one, or you may get a fall on the ice to stiffen your limbs, if they are not already stiff from dancing. The heaviest part of the day will be from five o'clock to seven, and you will be sorely inclined to sleep when the dressing gong is sounded. There is a want of effervescence about the dinner. The host looks tired, the hostess is out of humour, because her bachelors have not shown the attention to her young ladies which she had hoped for, the funny man has been snubbed, and has relapsed into a surly silence, and the beauty has got a cold in her head. It will be lucky if no attempt is made to revive the drooping spirits of the party by a dance (which may keep everybody up for the greater part of another night), or by some impromptu acting, or practical jokes.

Altogether, when the carriages, with the luggage upon their tops, come to the door on the morning after the second night, we feel a certain sensation of relief, although of course we have all "enjoyed ourselves immensely." We may be mistaken, but it flashes across our mind that our host and hostess seem even more pleased at our departure than they were at our arrival, and that they and their servants will be very glad to see the last of the party of guests who came to them for two nights and a ball.

A TURKOMAN POET.

THE Russians have recently discovered to their cost that the Turkomans are not to be despised as strategists any more than as warriors. A Hungarian Professor is disposed to add to this the further discovery that they are not unworthy of literary respect. There is nothing specially improbable in the existence of a true love of poetry and the attainment of excellence in the divine art among a semi-barbarous people. The example of the ancient Arabs, who would beguile the long hours of their forays with the composition of lyrics which no later writer in the Arabic tongue has ever equalled, is sufficient to show this, even if all study of early civilization did not lead to the same conclusion. The reason why we have hitherto heard next to nothing of Turkoman poetry is to be found partly in the fact that the Turkoman language has not yet attained the dignity of a literary instrument—they have but one book, and that essentially foreign, a translation of the Russian Bible—and partly in the small number of the travellers who have penetrated to their homes by the Oxus and have been in a position to gather up their oral compositions. So little has reached us of the tongue of these nomads that it is still difficult to assign to it its true place among the sister dialects of the great Turkish family. Probably Professor Vambéry's recent contribution to the Journal of the German Oriental Society is the most important record of Turkoman speech that we possess.

It is not, however, surprising that so little is known of the language when we remember the darkness that broods over the history of this remarkable people. Yomuts and Göklens, Chaudars and Imrailis, have dwelt from time immemorial in the steppes to the east of the Caspian; while Sariks and Salar and Kara Turkomans inhabited in the ninth century, if not their present ranges, at least the neighbouring steppes, between Balkh and Anjoi; and both divisions are alike called "the Ghuzz" by contemporary writers. The Chinese historians call them "barbarians of the mountains," and the trouble they caused from time to time to the Celestials would warrant a more opprobrious title. "Two thousand years before Christ," says De Guignes, "we obtain our first glimpse of this people, living in tents pitched upon carts, and moving in their travelling houses along the banks of rivers and over the plains which promised to furnish the best pasture for their flocks." The next fifteen hundred years are very barren in information about the Turkomans, but whenever they do appear they preserve their old characteristics unchanged. Without cities, ignorant of all commerce, they lived by plunder, and amused themselves by the chase. We read only of raids across country, burnings, pillagings, harryings. Early in the eighth century, when the Mohammedan conquests were pushed over the northern frontier of Persia, these nomads gained a wider celebrity, and we become better acquainted with them. The Arab conquerors were deeply enamoured of the fair girls of the Turkomans who fell into their hands as slaves. At a much later time the amorous Hafiz, in one of his lyrics, extols the beauty of a Turkish girl of Shiraz:—

> I would give for the black mole on her cheek
> All the riches of Samarkand and Bokhara.

The men were strong, hardy, courageous fellows, of an overawing stature; and the Khalifs of Baghdad, who were suffering from the masterful loyalty of their Arab subjects, were glad to surround themselves with a body-guard formed from the stalwart ranks of the Turkomans. No step could have been less judicious. The soldiery soon won the detestation of the populace and the dread of the Khalifs. They would ride at full gallop through the narrow, crowded streets, trampling down all whom they encountered—old men, women, and children indiscriminately. The complaints of the Baghdad citizens, and the frequent risk of street brawls, induced the Khalifs to transfer their capital to Samarra; but the relief of Baghdad was counterbalanced by the heightened misery of the Prince of the Faithful, who now found himself at the mercy of his body-guard.

The Turkomans now became supreme; they proclaimed and deposed Khalifs, murdering them now and then with every ingenuity of torture, or blinding them and then consigning them to the doubly dark misery of an Oriental prison; they sold the khalifate to the highest bidder; they massacred the townsfolk, and pillaged a famine-stricken country. Major Osborn has told the story in his pleasant, garrulous way, in his *Islam under the Khalifs of Baghdad*. At last they were swept away by a giant wave of their own people. The Seljuks, who had been allowed pasture land beyond the Oxus by the North-Persian dynasty of the Sámánís, and had made themselves very useful to their lords in their constant frontier wars, were allowed by Mahmúd of Ghazna, the celebrated iconoclastic invader of India, to cross the Oxus. This fatal permission put an end to the dynasty of Mahmúd, and brought about an invasion of the whole of the Eastern Mohammedan Empire. The Seljuks, after a short stay about Merv, swept in hundreds of thousands over all Persia and Afghanistan, put an end to the tyranny of the Khalif's body-guard, and, becoming Moslems, received the respectful blessing of the spiritual chief himself, snatched Syria from the Fátimís, and Anatolia from the Emperor, and reared the black flag of the Abbásís on the walls of Jerusalem. It was only for a short time that so universal a sovereignty could endure; the Empire which under Melik Shah stretched from Kashgar and the Punjaub to Nicæa and the Mediterranean, soon split up into fragments. A branch of the Seljuks of anti-crusading fame held Roum, or Anatolia, for two centuries and a half, till the beginning of the fourteenth century, when they were succeeded by a kindred dynasty, that of the modern 'Othmánli Turks, with whose language, both in grammar and phonology, the speech of the Turkomans of the Steppes presents many close analogies. It is a curious link in the history of the Eastern question. The Turks of Constantinople are the kindred and successors of a dynasty which came straight to Anatolia from the steppes where their kinsmen are now baffling the Russian army.

But not in language only is there a resemblance between the Ottoman Empire and the Steppes of the Turkomans. The author of *The People of Turkey* describes the hostility that ever exists in Turkey between the respectable orthodox "Ulama," or Doctors of the Law, and the irresponsible, heretical, and altogether pernicious Dervishes; and Professor Vambéry says that a similar enmity is found in the Steppes of the Caspian, which are traversed by numerous bodies of dervishes, sent forth from Bokhara, the focus of religious fanaticism in Central Asia. In these wild regions and among these unlettered nomads, no less than in Europeanizing Turkey, these zealots and ascetics find no little favour with the folk; and the most popular of the "Ulama" might reasonably envy the reputation and influence acquired by their rivals. Especially powerful did these dervishes become when they united the gift of song to their spiritual qualifications; the prophetic bard is more respected than either bard or prophet singly; it is felt to be convenient, or at least agreeable, to get your poetry along with your preaching, and quite recently a well-known Broad Church luminary has given his support to this view. Few dervish poets attained to so high a renown in the eighteenth century as Machdumkuli, whose verses Professor Vambéry has edited. He had the good fortune to belong to the Göklen tribe, which ranged the rich country of Upper Georgia, and added to its comparative ease of life a decided passion for poetry. Its Troubadours (Bachshis)

were the most gifted among all the tribes; and whenever they were seen approaching an encampment, staff in hand, and two-stringed dutara hung from the neck, the folk turned out to welcome them with transports of enthusiasm. Wherever they wandered, over all the country on the left bank of the Oxus, and in northern Persia, where they acquired a certain refinement unknown to most of their kindred, they were sure of a delighted audience. Whatever they said was of more account than the words of all the holy divines, and even than the Koran itself. To their credit it must be said that they used their powerful influence for good, and endeavoured to improve the moral principles of their particularly dishonest congregations. Their poetry was filled with the spirit of that mystical phase of Islam which we know by the name of Sufism, and which is so marked a characteristic of Persian poetry. In this respect Machdumkuli, orthodox *Sunni* though he professed himself, differs little from Ahmed Yesevi, the celebrated poet-saint of the Khirghis Steppes, or from the bards of the Uzbegs, as Bidil, Fuzuli, and Meshreb. In the very first poem of the collection of thirty pieces published by Professor Vambéry we can see the Sufi leaning, the contempt of the world, the ascetic view of life, and the craving for a mystic union with the spirit of the infinite:—

Says the heart: Far away from the folk,
I will wander o'er mountain and rock,
And the thought of my sin
Shall draw the hot tears down my face.
Each man that I meet is absorbed in thought,
And, for me,—my heart is with care distraught:
In the hollows of hills, in a lonely place
Will I dwell with the whin.

Black world, thou art vanity!
Man's life is insanity,—
Turmoil mad,
And Aching sad:
Drunk with the frenzy divine,
Helpless to fate we resign.

* * * * * * *

Let not this weary life pass fruitlessly,
Nor slight a kindly destiny.
Early a-morn will I raise in prayer
My mournful songs with the birds of the air:
Trustfully
Will Machdumkuli
Yield up to God his will unruly.
Says the heart: If I can fit me with a mate,
I join the sad observance of the dervish state.

In their desire to surround their poet with the halo of the miraculous, the Turkomans assert that Machdumkuli never visited Bokhara or any other collegiate city, that (like Mohammed, on whom be peace!) he could neither read nor write, and that his poetry came solely by divine inspiration. They believe devoutly in the visions which came to him when he was "drunk with the divine frenzy," and are convinced that the "Blessed" Prophet, and the bold 'Omar, and 'Ali, and other sacred personages of Islam, actually made spiritual journeys to the Steppes to commune with the Turkoman poet. Whether his verses were supernaturally prompted or not, it is clear that his admirers are right in denying him all claim to learning. His poetry is purely Turkoman, and contains little that is not either national or religious. Of his patriotic songs the following is a fair example:—

'Tis the troop of the Yomuts and Göklens a-move;
None knows whence they come, nor whither they rove;
From lands far remote and broad pastures they tramp,
No man knows their way, nor the place where they camp.
Let the "Raven" engage with the "Hawk" in battaille,
And the rocks and hills shake at the clash of their mail;
None knows how their feet cling to earth in the shock,
Nor which is the "Lion," the "Wolf," and the "Fox."
There are three thousand heroes with lances to heel,
Four thousand with muskets of glittering steel;
When the Tekkës come rushing like hailstones a-down,
None knows who's the Nomad and who the dull clown.
Like the rush of the storm-wind, they seize Isfahan,
And hamlets whose number no ciphers can span.
Machdumkuli, Lion 'Ali is there on the field;
See how 'Omar and 'Othman their shining blades wield!
The world is full-filled with the neighing of steeds;
Is this earth, or but dust, lies on Khorassan meads?

Machdumkuli's religious poems all smack of Sufism, and our first specimen will stand for all. A much more interesting section of his compositions deal with moral matters. This strange Turkoman dervish had very distinct notions of right and wrong, and a high ideal of conduct. Professor Vambéry asserts that Machdumkuli's moral influence still works for good among the descendants of those who were first moved by his words to turn towards "the right way"; and we can readily believe that his fine picture of the ideal warrior may have produced a stirring effect upon the tribes whose prowess he extols with so patriotic an enthusiasm. And he had the boldness of his convictions. He preached against theft and tobacco to a nation of smoking robbers. To us his lines against smoking can only appear humorous; but to him they meant a strong religious detestation:—

God has put thee in the world with a Will, 'tis agreed;
Do then what thou willest, O smoker of the weed!
But before the Judge's throne, on the awful day, take heed!
What hast thou for apology, O smoker of the weed?

Thy body—it is shrunken, thy strength is fled away;
Thou babblest, but thy intellect is fallen to decay;
Thy nerves are stirred with twitches, thy limbs a scratching need;
These are now thy symptoms, O smoker of the weed!

Such crooked ways must damn thee in Heaven as well as here;
If thou be man, abjure them, and to the right adhere.
By the side of him who prays not, the liar, and the thief,
Will stand the wretched smoker on the last great day of grief.

O Machdumkuli, God is dearer far than earthly day,
The Pipe is only bitterness—the body is but clay;
Sin is the Fox of subtle guile; but in the time of need,
The Fox will not avail thee, O smoker of the weed!

Love-poems are rarer in this collection than might have been expected; and of those that are recorded, not a few seem to have a spiritual meaning. Perhaps the dervish here was too strong for the poet and the man; though we do not find love reprobated with tobacco, nor is the lover consigned to a place in that mournful line of sinners in which the absorber of nicotine is to hold so unexpected a position. The following little piece, or rather fragment of a piece, is as prettily fancied as anything of the kind we have met with in Oriental poets:—

Two score journeys over the sea,
If the darling would only beckon to me!
Forty years would I carry my chain,
Or wander for sixty, for one week's bliss,
My life for a look were too easy a gain,
Would my dear one but turn me her beauty, I wiss.

And if I am worthy to see her—still
Must the pain of our parting my heartstrings thrill?
At a touch of hope all sorrow would flee,
Would the door of her palace but open to me!

Altogether the Divan of Machdumkuli, even as seen in a somewhat literal version, is a curious study, and as a specimen of a very scanty literature, and one likely to be further reduced by force of arms rather than by criticism, it deserves a welcome; and Professor Vambéry has added to his many claims upon our gratitude by rescuing from forgetfulness the verses of the Turkoman Dervish-Poet.

LOSS OF THE *BORUSSIA*.

UNDER an Act of Parliament passed last Session, the tribunal which has to investigate shipping disasters is to be considerably strengthened. In addition to the Wreck Commissioner or magistrate who presides, and to assessors taken from the Royal navy, there will be an assessor taken from the merchant navy, and a certificated engineer is to be a member of the Court when an engineer is on his trial. The assessors, moreover, are to be chosen with greater care than heretofore, as men who have had experience in sailing-vessels are to be selected when the inquiry relates to a sailing-vessel; men who have had experience in steamers when the inquiry relates to a vessel of that class. The new Court will certainly be stronger than the old one, and it is well that it should be so, for the latter was in some respects defective, and investigations respecting shipping disasters are now often of very high importance. Several grave cases are, it seems, already awaiting the tribunal, and amongst them is one of great public interest, which is likely to test to the uttermost judicial acumen and nautical sagacity. The circumstances relating to the loss of the *Borussia* will have to be considered, and, without further information than any which now appears to exist, it will be a task of very considerable difficulty to discover the reason why this vessel failed so completely, or how it was that so small a proportion of those on board have been saved. At present only fifteen are known to be living out of one hundred and eighty-four, the total number of passengers and crew. It was stated with some confidence at the end of last week that more had probably been rescued; but up to the present none have been heard of, and it seems unfortunately not unlikely that there are no survivors except those who have been mentioned. It is not indeed by any means too late to hope that other boats than theirs remained afloat and were picked up by ships; but for the present it must be assumed that no other evidence than theirs will be forthcoming, and that any conclusions which may be drawn as to the sad catastrophe which caused the loss of 169 lives must be based on their statements. Most unfortunately their evidence, so far as it has been hitherto made public, is confused and in parts contradictory; and unless some of them can give more and much clearer information than has hitherto been given, it may be found scarcely possible to elucidate all the facts. At present some inferences may perhaps fairly be drawn; but nothing like certainty is attainable. A short account of the narratives which have been published will show what discrepancy there is between them, and how little is really known at present respecting this grave disaster.

Certain facts of course were ascertained at once, and without difficulty. The *Borussia*, it seems, was an iron screw-vessel, built in 1855, and therefore decidedly an old ship; but an iron vessel of considerable age may be thoroughly strong and seaworthy, and there appears to have been good reason for holding that the *Borussia* was seaworthy in the true sense of the word, although it is to be noticed that she was not classed either at Lloyd's or at the Liverpool Registry. She was chartered for the conveyance of troops to the Cape last spring, and was, it is said, twice surveyed by Government officials, once at Liverpool, and once at Southampton. The result of both surveys was apparently satisfactory, and the steamer took troops and horses out to Natal. It should be observed that she had, for a steamer, a considerable beam in proportion to her length, so that she ought to have been a good vessel in a sea. Her engines were not nearly so old as the hull,

having been fitted by Messrs. Day and Summers in 1871. On the whole, there appear to be no grounds for supposing that, when she started on her fatal voyage, there was, according to the estimate usually formed of iron ships, any reason for thinking her unsuited for winter weather in the Atlantic. The particulars of that voyage are very short. On November 20th the *Borussia* left Liverpool for Corunna, Havannah, and New Orleans, having on board 66 passengers and a crew of 54 all told. At Corunna 64 Spaniards joined the vessel. On November 30th, four days after she left that place, the wind, previously light, freshened to a gale, which on December 1st suddenly chopped round from S.E. to N.N.W. In consequence of this sudden and very great change—much resembling that which occurs in the vortex of a cyclone—there was a very confused sea, and, labouring in this, the *Borussia* sprang a leak. The pumps were set to work, but they can have produced but little effect, for the water gained rapidly and put out the engine-room fires. On the afternoon of the 2nd there were eleven feet of water in the hold, and orders were given to get ready the boats.

Up to this point the story seems tolerably clear, though, as will be shown presently, there is considerable difficulty in reconciling parts of it with some statements which have been made respecting the construction of the ship. Of what happened when it became necessary to take to the boats confused and contradictory accounts have been published. So far as is at present known, two only kept afloat. In one which was picked up by the *Mallowdale*, a ship from Bassein in Bengal, were the doctor of the *Borussia*, the third officer, the fourth engineer, and seven of the crew; in the other, picked up by the *Fulda*, a German vessel, were five Spanish passengers who had gone on board the steamer at Corunna. An account of the disaster, purporting to come from them, has been published, and another has appeared in the *Times*, which is stated to have been given by the third officer, and one of the men who were in his boat has described the calamity in the *Daily News*. There are some apparent inconsistencies between the narratives. The third officer says that seven boats were launched, and that in the first which got away were the mate (presumably the first mate), thirteen passengers, and some of the crew. Provisions, according to his account, were placed in her before she left. The next boat to leave the vessel was a large one, having on board twenty Spaniards and some of the crew; and, just as she got clear, the lifeboat, with two stewards in it, was seen adrift. The third officer, with a boat's crew, was sent to bring her back. He got into her with some of his men apparently, leaving five men in his own boat which he took in tow; but he was shortly obliged to cut the painter, and she was swamped, those in her being drowned. He tried, he says, to get back to the *Borussia*, which, when he left her, was sinking fast, but he could not, owing to the wind and sea. In all probability she sank in a very short time. After four days' exposure, this officer and his companions were picked up by the *Mallowdale*.

The account in the *Daily News* differs in some respects from that of the third officer, although it confirms his statement that all the boats were launched. In this narrative it is alleged that perfect discipline prevailed, and that, after the boats had been lowered, provisions were put into them, but that many of the passengers were afraid to leave the ship. Another and a somewhat strange tale has been told by the Spaniards who have been saved. According to their account, which has appeared in the *Daily Telegraph*, they got into a boat with a lady, two girls, and the chief officer—who, in the other history, was said to have got safely away. The boat was dashed against the side of the vessel; and the officer, fearful that she might sink, clambered on board the vessel, followed by the women and the girls, who certainly showed remarkable activity. The Spaniards were less capable, and the boat drifted away with them. A hole had been stove in her side, which of course caused imminent danger; but it was stopped by a singular expedient, having a remarkable resemblance to one described in *Baron Munchausen*. A pair of oilskin trousers were stuffed into the leak, and two of the men sat upon them to keep them in their place. For five days and six nights the boat drifted hither and thither; but the Spaniards, who must have been extremely hardy fellows, survived the exposure, and on the 7th December they were picked up, in lat. 33° 15′ N., long. 35° 45′ W., by the barque *Fulda*, bound for Liverpool. From the accounts given by the castaways, the captain came to the conclusion that the *Borussia* foundered in lat. 36° N., long. 36° to 37° W.

The discrepancy between the stories of the Spaniards and that of the third officer is striking. They say that the chief officer got into their boat and then got out again. In the other narrative no mention whatever is made of the Spaniards' boat getting adrift; and it is stated, with every appearance of precision, that the first boat to leave the ship was in charge "of the mate," and that she had in her thirteen passengers and some of the crew. Of course the account of the third officer, a seaman who presumably had his eyes about him and took note of what happened, carries more weight than that of passengers belonging apparently to a humble class; but, unfortunately, it is hard to place much reliance on it, since there are statements in his narrative, as given in the *Times*, which are not easy to reconcile. If, as he said—or, rather, as he is reported to have said—he was sent away merely to pick up the lifeboat and to bring her back to the ship, how does it happen that the doctor and fourth engineer were in his boat? They were neither of them seamen nor part of the crew, and were not likely to be of the slightest use in the service for which the boat was despatched. His story, moreover, as given by the reporter, differs considerably from that of the *Daily News*. The survivor who has given that account says that the boat in which he was taken in tow by the third officer's boat, but that she got swamped, and that eight of these in her managed to escape into the other boat. These discrepancies are very likely due to the reporters; but, as the narratives at present stand, they are contradictory on some essential points. As to the Spaniards' account there is not much to be said. It seems strange that, if a lady and two girls could scramble on board the steamer, strong men could not; but chance may have favoured the former, or the Spaniards may have allowed them to go first, certainly showing, if they did so, most chivalrous courage. The men have not yet apparently been examined as to what they saw of the other boats, and it is quite possible that when questions are put to them on this subject information of great value may be obtained. At present, as has been shown, but little has been clearly ascertained respecting the disaster. All that can be said for certain with regard to the boats is that the ship carried seven of them, and that of these two got safely away, one containing three officers and some of the crew, and the other five male passengers who, from the endurance they showed, may be presumed to be very vigorous men. The careful and systematic investigations of a Court will very likely bring much to light which is at present unknown, and will perhaps make clear and intelligible the story which, as told by the reporters, is hazy and confused. That a true and full account may prove to be satisfactory is by no means improbable; and it may be hoped that the result of the inquiry will not be to show that in this, as in so many other cases, the strong thought only of their own safety, and left the weak and helpless to perish.

Apart from any question about the boats, there is one fact connected with the loss of this vessel as to which no doubt can be entertained. The leak which was sprung must have been an extraordinary one. Some large gap must have been opened in her skin, since the water entered in such quantities as soon to put out the engine-room fires, the pumps producing apparently scarcely any practical effect. How is it that a vessel supposed to be strong and seaworthy opened in such a manner that, though she had steam-pumps, her case soon became hopeless? It may be said that any ship might spring a bad leak in such a sea as the *Borussia* had to encounter; but to this it can be answered that there are reasons for supposing that the sea, though a confused one, was not very terrible. Two open boats lived in it; and, although this fact by itself would prove nothing, as boats have often lived in tremendous seas, it may be noticed that in this case one of the boats was injured, and that of the five men on board her only one had any pretension to be a sailor. That a vessel which had recently undergone two strict surveys, and was supposed to be thoroughly seaworthy, should founder as the *Borussia* did, is calculated to cause very considerable doubt as to the estimate often formed of the strength of iron ships, and as to the efficiency of the present method of survey. However, it may be said that iron, strong and admirable material though it be, is, like all materials, imperfect in some respects, and that there may be defects in an iron fabric against which no skill can provide, and which cannot be detected by the closest examination. There would be some justice in this; but, even if the truth of it is fully allowed, and if it is admitted that such a leak as that of the *Borussia* is likely to be a very rare accident, her loss must still be regarded as a most alarming catastrophe, inasmuch as there is one fact connected with it more grave than the magnitude of the opening in her iron skin. The ship, it is said, had ten water-tight compartments. How was it that these did not save her? They ought to have saved her to a certainty, however big the gap in her plating might be. If the leak was near the furnaces, the fires of course might be put out; but still nine compartments should have remained free from water, and she ought therefore to have remained afloat. The ship, however, seems to have filled steadily, and, so far as can be told, sunk. How was it that the vaunted water-tight compartments were of so little avail? We believe that their failure is to be attributed not to any peculiarities in the *Borussia*, but to the fact that she was constructed according to a faulty method, which unfortunately is still very generally followed. Owing to this thoroughly defective system, the so-called water-tight bulkheads are in many cases worthless. Some explanation of details is required in order to show the grounds that exist for this opinion, and want of space prevents us from treating this subject at present; but we trust to recur to it shortly, as it is undoubtedly of grave importance, and seems at present to be but little understood.

TALL MUSIC.

MOST people are more or less familiar with the not unromantic story of Rouget de L'Isle and his thrilling composition. History repeats itself, and what happened a century ago in France has now happened again in New York city. Providence, according to that delightful print the *New York Herald*, has specially interfered to give to America a national anthem to rival, if not to surpass, "Yankee Doodle." The first intimation of this gratifying piece of news is conveyed in a head-note composed of these remarkable words:—"COLUMBIA. Mr. P. S. Gilmore on his new

National Anthem. An Angelic Inspiration. How it Came in the Night and was Wedded to Words." From the article which is heralded in this magnificent fashion we learn that Mr. P. S. Gilmore is "the well-known maestro and organizer of the Jubilee Festival," and that since it has been known that he has composed words and music for a new National Anthem, "the greatest interest has been felt in the matter in musical and social circles. Excellent judges have declared that the composition is so full of merit that it will immediately become popular." Of course the first result of Mr. Gilmore's inspiration was a visit from a *Herald* reporter to Mr. Gilmore's residence, which is one "in which any person would love to linger." This is, perhaps, not only because of the comfort of the rooms, but also because their owner is "one of the most approachable gentlemen in his profession when it is desirable to obtain information for the public." *Herald* reporters bent on "interviewing" leading physicians have, we are glad to note, been somewhat freely snubbed of late; and possibly the person who loved to linger at Mr. Gilmore's had a keen recollection of other persons who had been less approachable. In spite of his approachableness, Mr. Gilmore was driven to confess that he could not give any very intelligible account of his recent inspiration. He told the *Herald* reporter with frank apology that he had been in a state of mental excitement "such as I have never known in my career, and until this heaven-inspired production is presented to the public in the manner which I have planned I expect no rest." "But how," said the reporter, combining sympathy with business promptitude, "did this trouble originate?" The answer to this question would be so clearly spoilt by being paraphrased, that we propose to give the greater part of it in the inspired composer's own words, as set down by the "interviewer" who loved to linger with him.

It opens with melodramatic impressiveness. "I was lying on yonder lounge" (this reminds one of "Do you mark yonder gloomy cavern?") "in a half-dreamy mood, when suddenly there flashed upon me, complete in all its details, just like a perfect picture, a melody, a thought; I ran to my desk and put it on paper. Here! See! There is a change but in one note. There it is—the original, just as it came inspired by the angels. It isn't mine." (There is a fine and characteristic modesty about this.) "It has come from God. I am only the messenger. From that moment it assumed form, and to me possessed a soul. The melody filled my nature to a degree that I was unable to repress. Going to the Grand Opera House to attend the usual Sunday evening concert, I found myself still in the dream, charmed. I went through the direction of the music in a purely mechanical way, sometimes being obliged to count the movements of my own bâton to assure myself of my own identity." It would appear from this that the composer and "messenger" Mr. Gilmore is in the habit on ordinary occasions of conducting his band without paying any attention to the number of movements made by "his own bâton"—a method which may possibly be a little confusing to the members of the orchestra. But then it is not every conductor who is favoured with "angelic inspiration." "To tell you the truth," Mr. Gilmore continued confidentially, "I was not there at all." He conducted the band "automatically" through the overture to *William Tell*, but he was really thinking all the time of his angelic melody. It is to be hoped that the band was as thoroughly versed in the art of automatic movement as its director. When "the melody" first, in the words of the reporter, "presented itself," all Mr. Gilmore could say was "Thank God!" for he felt that it was a gift from above. He was then filled with a desire to wed this heavenly music to equally heavenly verse; and, after he had struggled for two or three days or nights with "something I know not what," there appeared to him "suddenly, as if by inspiration, the picture of America from her growth to the present time presented in verse." He sprang from a sleepless bed, and, more fortunate than Coleridge, wrote down the whole of his inspiration at once. "I transcribed," he said, "what has been sent to me by heaven. I believe it—yes; don't smile, it is immortal."

We now fall with startling and harlequin-like rapidity from heaven to earth. "How," asked the reporter, suddenly becoming prosaic, "do you propose to utilize this idea?" "In a business way," answered Mr. Gilmore, falling in with the changed mood of the *Herald*, "I have protected myself by copyright so far as the music is concerned." Patriotism, however, and recollection of heavenly goodness, "like an angel came" to soften the hardness of this utterance. "Wherever the words and music are combined in the schools," Mr. Gilmore added, "I shall be glad to have them used. Indeed I think there will be no public occasion on which after a while the stirring notes of my anthem will not be heard." This shows belief on the composer's own part in his powers; but a more practical proof of this is afforded by his assertion that the last verse is especially adapted for every reverential occasion, and that "for myself I sing it as my morning and evening prayer, and my family join me in using it as a part of our nightly praise to the Almighty." Mr. Gilmore then returned to his belief that his composition was one "of those happy thoughts that grow around a man when he is intellectually in 'the process of incubation,'" which, to judge from the context, is a less impressive way of saying that he thought he was inspired; and he added that when he had finished the work he felt as if he had lived fifty years. On this the reporter ventured to "infer that you do not regard this as a commercial enterprise?" "Not in the least," promptly answered Mr. Gilmore, flinging for the moment all thought of copyright in music to the winds. "I felt that the music and the words would make their mark on the face of time. They have been sent from heaven, and are an inspiration. Such words and music never would have been given me if they were not intended for a great and beautiful mission." It is greatly to be regretted that the *Herald* has not been able or thought it well to publish the music of this remarkable production; but we may console ourselves by reflecting that, as both were inspired, we may judge of the quality of the one from that of the other, and that we are allowed to become acquainted with the words, of which the following are the first and last stanzas:—

I.

Columbia! First and fairest gem
On Nature's brow—a diadem,
Whose lustre, bright as heavenly star,
The light of Freedom sheds afar;
Like Noah's Ark, a God-sent bark,
In search of land through day and dark,
First found thee held by Nature's child,
The red man in his wigwam, wild.

* * * *

VII.

At morn, at noon, at eventide,
Oh, Lord! be ever at our side,
That we Thy voice may always hear,
And feel that Thou art ever near.
In mercy spare from grief and care
The nation bowed in fervent prayer,
Who ask with reverent love and awe,
God bless and save America!

We would call the special attention of our readers to the inspired rhyme in the last two lines. When the reporter had studied, and no doubt been properly impressed by, these remarkable lines, he asked if Mr. Gilmore expected to supplant such other airs as "Hail Columbia!" "The Star-Spangled Banner," and "Red, White, and Blue"? "Not at all," said Mr. Gilmore, with becoming modesty; but added, with just and conscious pride, "Yet neither of these airs is American. Nor are the words of the songs as effective as those which are presented in the heaven-born song I have handed to you. But I think there is an inspiration in *Columbia* that will give it place wherever it may be heard." This, of course, remains to be seen, and we shall look with interest for the effect on the American public of the heaven-born song communicated to Mr. Gilmore while he was "lying on yonder lounge."

THE WATER-COLOUR EXHIBITIONS.

THE exhibition of this season at the Gallery of the Society of Painters in Water Colours will be chiefly remembered in time to come for the remarkable notification contained on the back of the cover. This document reads as follows:—"The Election of Associate Exhibitors takes place in March. The third Monday in March is the day appointed for receiving the Drawings of Candidates. There is no vacancy for a Lady Member." In other words, the Society wants a new Associate, but no lady need apply. During the seventy-five years that the Society has existed no such notification has been issued before. Ladies have always been eligible for election, and have always been sparingly elected. There are, of course, two meanings which can be attached to these "epoch-making" words, "There is no vacancy for a Lady Member." They may mean, as is generally reported, we believe, in the artistic world, that the Council of the Society has passed a law excluding women for the future from election; or it may mean, as we sincerely hope it does, that for the present the gentler sex is represented amply enough in the Society. At present the Society consists of thirty members, all male, and of forty-one Associates, of whom six are ladies. There are, moreover, five honorary members, of whom the Princess Louise is one. Out of seventy-six persons, therefore, seven are of that dangerous sex so much dreaded by the Council, and they form a desperate minority of nine per cent. The most crushing chastisement that could well fall on the Society would be the simultaneous resignation of all the seven ladies now enrolled; and much as we should regret this step in the interests of art, there can be no doubt that it would be an excellent comment on what, viewed simply from the outside, seems a mere aimless piece of discourtesy. Strangely enough, the present exhibition is one which owes its attraction almost more than any previous one to the exertions of the lady members of the Society. The Princess Louise exhibits seven of the studies she has brought back with her from Canada; Miss Clara Montalba, in ten works of much interest and beauty, starts on a wholly new development of her fine talent; while Mrs. Allingham, in the best of the somewhat unequal drawings she exhibits, has never shown so good a touch or so delicate a style. We confess that it is impossible to record in the work of any of the male members or Associates such progress as in that of these two ladies. Mr. Albert Goodwin and Mr. Carl Haag display their respective gifts at their usual high level of excellence; Mr. Alma Tadema strikes out no new path in one accomplished drawing in his peculiar style; while of the younger Associates, Mr. Parker, Mr. R. W. Macbeth, and Mr. Buckman have all attempted innovations in style that have the interest of tentative essays. On the other hand, three painters from whom we are accustomed to expect very excellent work—Mr. Alfred Hunt, Mr. Henry Wallis, and Mr. Henry Moore—have unaccountably done less than justice to their powers

this year; while Mr. Shields and Mr. Boyce do not exhibit at all. On the whole, however—but very largely, be it repeated, owing to the ladies—the exhibition is decidedly above the average of merit.

Having summed up our impressions in these sentences, we may devote the remainder of our space to a survey of the walls, noting in order what seems to us notable. Mr. A. H. Marsh's "Wayfarers" (6) is a powerfully painted study of two melancholy girls resting on the road-side. It has less sickliness of colour than much of this painter's earlier work. The first of Miss Montalba's studies of the Thames in the City must strike the visitor with a strange sense of originality. Her "Blackfriars Bridge" (7) is a wonderful *tour de force* in colour—the red granite of the bridge contrasting with the grey water, and the silver domes of St. Paul's issuing from the mist above. A damsel in bright red, conversing with a robin, also in bright red, upon a snowy scene (13), is a good example of Mr. Brewtnall's skilful but inharmonious manner. Mr. Alfred Hunt's "Capel Curig" (17) would hardly attract blame for the woolliness of the water if it did not bear his eminent name, from the owner of which we expect much better work than this. Over Mr. Ruskin's curious and careful studies of violet porphyries and cream-coloured marbles in St. Mark's (28) hang two more of Miss Clara Montalba's bewitching views in the City, "A Grey Day on the Thames" (26) and "London Bridge" (27). Mr. Albert Goodwin's "Among the Water Weeds at Bisham" (44) is one of the most poetical and natural studies of cloud-shadow and pearly light ever produced, even by his hand. This is certainly the best of ten drawings, all in their way admirable, which the present collection contains. Mr. Macbeth's "Landing Sardines at Low Water" (59) is clever and striking, but crude. A set of three views from the Citadel of Quebec (101) hangs in the place of honour, and gives a very favourable idea of the native powers of the Princess Louise. She evidently looks at nature with her own eyes, and possesses considerable powers of manipulation; it would, however, be mere flattery to say that these powers do not still need training. Mr. Albert Goodwin's "To Market" (105) must not be missed in the most casual survey. Mr. Wallis's "Luca Signorelli" (122) is painted strongly and brightly, but lacks refinement; while the habitual weakness of this artist for harsh colour has been checked even less than usual. Mr. Parker's "St. Peter's Street, Great Marlow" (141) is delicately drawn, and pleasantly suffused with rainy sunset colour. Mr. E. K. Johnson has found a very good subject for his talent in flower-painting in "An Intruder" (143), a fat pony, who has impudently strayed among the rich parterres of an old bowery garden, and who advances among the lilies with an air of absolute nonchalance. In a view of "Corte" (159), and still more in "Whitby Harbour" (197), we meet again with the accustomed qualities of Mr. Alfred Hunt, though even here we find something evanescent in the drawing of the ground, which looks more like the gorgeous fabric of a cloud than like real earth and rock. Mr. Dobson's "Daisy" (198), a little girl's head, very wide between the eyes, is well drawn. A study of boys bathing off "A Thames Wharf" (247) marks, to our mind, the high level hitherto of Miss Clara Montalba's attainment. It would be difficult to praise too highly this combination of mystery and light, rich depth of shadow and silvery tissue of vapour; the artist has discovered a new and unexplored field for her powers in the roaring channel through which the merchant navies of the world go up and down, regardless of beauty or effect. She gives to London dirt and fog a new charm. Speaking critically of Miss Montalba's painting, as we see it this year, we should say that it has ceased to have any affinity with contemporary English art, and, as far as it reminds us of any school, it is of the modern landscape art of the Hague; yet, in saying this, we would take nothing from its individual originality. Mr. Edwin Buckman's impression of "A Stormy Twilight" (281) is boldly felt, but expressed in a manner hardly satisfactory.

On the screens Mrs. Allingham reigns almost supreme, except where Mr. Alma Tadema hangs his scholarly and highly-finished portrait of "An Old Roman Bachelor" (356). The picture is faultless, but we could wish that the most technically perfect of modern artists would recur to his former triumphs in historical painting. Mrs. Allingham's little studies of children in bright spring landscape are as fresh and natural as it is possible for such things to be. "In the Duke's Park, Albury" (335), "On the Sands" (317), and "Hop-Tying, Kent" (365), are each of them delightful; but perhaps the best of all is the deep dell of bluebells "Near Sevenoaks" (331), which for radiance of light and clear spring colour demands the very highest praise. We notice an excellent specimen of the heroic colouring of the Nestor of living painters in Mr. Samuel Palmer's admirable "Going to Fold" (360).

A review of the exhibition of the Society would be imperfect without a reference to one or two works, prominently thrust before us on the line, which form beacons for the student to avoid. Such are the positively execrable paintings which, in slavish following of the elder Richardson, continue to be exhibited by Mr. Collingwood Smith. Scarcely better than these in successful imitation of chromolithography are the productions of Mr. Danby, Mr. S. P. Jackson, and Mr. T. M. Richardson, in none of whose works, as seen here, is there to be discovered the smallest study of nature or the faintest feeling for art.

The general level of merit at the exhibition of the Institute of Painters in Water Colours is much lower than at the Society, but there are a few works of quite as much value in the former as in the latter. For instance, the inner room, which is occupied with studies in black and white, contains drawings by Messrs. Aumonier, C. Green, Herkomer, and W. Small, which are as excellent as work of this kind can be. As an example, we may as fairly take Mr. Green's "Firing a Salute, H.M.S. *Victory*" as any other; and it is not too much to say that this drawing displays qualities in design and a sort of masterly delicacy that have seldom been brought to bear upon such work till now from the days of Rembrandt. But these studies in black and white hardly belong to water-colour; and, when we turn back to the paintings, we are bound to confess that the Institute compares ill with its older rival. Mr. J. D. Linton, Mr. Seymour Lucas, and Mr. Gow represent the best element in the Institute, a school devoted to historical figure-painting and with a penchant for mediæval romance. Undoubtedly the best piece of painting in the gallery is Mr. Linton's "Flag of Truce" (68), the garrison of a beleaguered city sending out an old captain on horseback with a white flag. There are points in this work, such as the figure of the youth who holds the horse's head, and the foremost senator who lifts his ivory staff as he bawls out his last directions, which Mr. Linton has never surpassed. Very good, in a slightly similar manner, are Mr. Gow's "Stragglers" (78), two wounded soldiers in a barn; and Mr. Lucas's "A Question of Date" (29), an antiquary comparing some ancient suits of armour. Mr. C. Green exhibits two very clever and ingenious little pictures—a lady in the costume of 1820 (356), and a gentleman in the ineffably absurd dress of 1793 (357), a narrow yellow silk coat drawn tightly across a white satin waistcoat, and displaying a vast area of loose pink breeches below. Mr. Townley Green has done better things than he exhibits this year, but his "None so Blind as Those who Won't See" (295), a youth in a boat vainly trying to gain the attention of a girl walking on the bank, is pretty. Mrs. Elizabeth Murray contributes some Arab scenes, drawn with care and spirit. Mr. J. Wolf's "Storks Starting for the South" (55) is very strange and clever.

REVIEWS.

ARNOLD'S SELECTIONS FROM WORDSWORTH.*

ADMIRERS of Wordsworth must often have wished for such a selection of his poems as this; but it is well that the task has been reserved for the subtlest, the most sympathetic, and the most candid of his critics. Mr. Arnold, while he asserts the greatness of Wordsworth, laughs not unkindly at those whom he calls Wordsworthians, avowing indeed that he is a Wordsworthian himself. "I can read with pleasure and edification *Peter Bell*, and the whole series of *Ecclesiastical Sonnets*, and the address to Mr. Wilkinson's spade, and even the *Thanksgiving Ode;* everything of Wordsworth, I think, except *Vaudracour and Julia*," which probably no human being except the author ever read through. Though almost all poets are unequal, scarcely any writer of verse has both risen so high as Wordsworth and so often sunk into the commonplace of artificially measured prose. The mass of Campbell's poems are worse than the worst of Wordsworth's; but Campbell's lyrical genius only rose into half-a-dozen flights, while, as Mr. Arnold justly says, "What strikes me with admiration, what establishes in my opinion Wordsworth's superiority, is the great and ample body of powerful work which remains to him, even after all his inferior work has been cleared away." The object of the present volume is to display, by the separate publication of the best poems, the "ample body of Wordsworth's powerful work." The selection is almost faultless, except that Mr. Arnold has imposed on himself an artificial restriction by only admitting entire poems. The episode of Margaret, from the *Excursion*, was composed independently of the poem to which it was afterwards attached; and a well-known extract from the *Recluse* was published long before that bulky autobiography. Some exquisite stanzas might have been selected from *Peter Bell*, and some of the digressions and narratives of the *Excursion* have a unity and an interest of their own; but it was for Mr. Arnold to determine the conditions of his laudable enterprise. It is not impossible that he may find, in a generation which seems to have no rising competitor for fame, some proselytes to an orthodox faith in the greatest English poet of the last two centuries. At present there is reason to fear that Wordsworth is little known. Mr. Arnold says, not inaccurately, that his reputation attained its highest point at Cambridge from about 1830 to 1840. Before that time he had been overshadowed by the popularity of Byron; and soon afterwards Mr. Tennyson began to exercise an exclusive attraction over his own contemporaries and younger readers of poetry. The most lasting fame generally descends from higher levels to diffuse itself among the literary populace; but in his own time Wordsworth was almost exclusively appreciated by men of genius and critics of the highest order. Coleridge felt an almost excessive reverence for his intellectual power. Scott lost no opportunity of acknowledging the genuineness of an inspiration which had nothing in common with his own except its vigour and sincerity. Rogers carefully cultivated the friendship of the oracular recluse. Moore speaks of him as "a poet, indeed—not *qualis ego vel Cluvienus*."

* *Poems of Wordsworth.* Chosen and Edited by Matthew Arnold. London: Macmillan & Co. 1879.

Byron's incessant ridicule of Wordsworth indicated a jealous suspicion, though not a perception, of his greatness. Shelley's earlier and sounder judgment acknowledged him as the "Poet of Nature," though he afterwards disgraced himself by publishing, perhaps under the influence of Byron, a coarse and brutal lampoon, not only on Wordsworth, but also on his blameless sister. Both De Quincey and Landor, though they sometimes carped at Wordsworth under the impulse of caprice or irritation, in their better and more sincere moods fully recognized and eloquently extolled his genius. Lockhart, with the enthusiastic exaggeration of youth, praised him, not only as a poet, but as the greatest philosopher of the time; and Sir Henry Taylor was misled by legitimate admiration into the same misapprehension of the quality of his genius. Two able critics of the present day—Mr. John Morley and Mr. Leslie Stephen—while they hold few of Wordsworth's doctrines, revere him as a great ethical teacher. Mr. Arnold more justly asserts that Wordsworth's "poetry is the reality; his philosophy, so far at least as it may put on the form and habit of 'a scientific system of thought,' and the more that it puts them on, is the illusion."

In spite of the concurrent testimony of all competent witnesses, with the doubtful exception of Byron, the multitude of readers never heartily accepted the judgment of their authorized teachers. One excuse for their obstinate incredulity may be found in the mass of second-rate matter which fills the greater part of an edition of seven volumes. As Mr. Arnold says, "Work altogether inferior, work quite uninspired, flat, and dull, is produced by him with evident unconsciousness of its defects, and he presents it to us with the same faith and seriousness as his best work." His want of discrimination may be partially explained by the uniform earnestness which concentrated his attention on his immediate subject. His highest excellence may be attributed to the same cause. He thought far too little of style and form of expression; and it was only by accident or on rare occasions that his unpremeditated language coincided with the current of inspiration. "Wordsworth's use of it," says Mr. Arnold of his "nobly plain manner," "has something unique and unmistakable. Nature herself seems, I say, to take the pen out of his hand, and to write for him with her own bare, sheer, penetrating power." His subjects are in themselves always susceptible of grave treatment, and sometimes of profoundly pathetic effect. When perfect felicity of musical phrase is applied to subject-matter of deep intrinsic interest the charm of Wordsworth's poetry is indescribable. Mr. Arnold in his preface contends with much force that "the noble and profound application of ideas to life" constitutes the distinctive excellence of English poetry. It is certainly characteristic of Wordsworth. Caring little for books or for the pleasures of society, he devoted himself to the solitary observation of external nature and to the study of simple and rustic character, especially in its relation to domestic affections and experiences which are common to all mankind. Other poets, with equal command of rhythmical language, fail to produce the same effect, if they deal with trivial or fanciful subject-matter. The description of Arethusa's course from the Acroceraunian mountains to "the rocking deep beneath the Ortygian shore" is in the highest degree melodious; but nobody cares for Arethusa or Alpheus except because they furnish Shelley with the material of a poem. The dullest reader will pause for a moment in reflection and sympathy when he is invited

> To talk of sunshine and of song,
> And summer days, when we were young—
> Sweet childish days, that were as long
> As twenty days are now.

It must not be supposed that Wordsworth's idyllic narratives are mere anecdotes derived from his own personal experience. The Bishop of Lincoln's prosaic and professional biography of his illustrious kinsman is not without value, in as far as it includes an account by Wordsworth himself of the origin of some of his poems. It was a visitor at his house, and not himself, who gave the cloak to Alice Fell. Miss Wordsworth told him of the picturesque vagrant woman whose children are supposed to have tried to impose upon him; and she also, with an eye for nature as delicately accurate as his own, noticed the dance of the famous daffodils. The two best lines in the poem were composed by Mrs. Wordsworth. The hero of *Resolution and Independence* was not met on a moor; and it is almost disappointing to learn that in his early Scotch tour the poet abstained from visiting Yarrow, only for reasons of convenience. Strange to say, Matthew himself was an imaginary person. It is more interesting to learn that the Wanderer of the *Excursion*, as far as he was drawn from life, was intended to represent Wordsworth himself. He had often thought that, if he had been born in a somewhat lower rank, he should have adopted by choice the life of a pedlar, as that occupation was practised among the Northern valleys during his early years. Perhaps no writer belonging to the upper or educated class ever entered with so entire and unaffected sympathy into the life and experience of his humbler neighbours. Although Wordsworth was at one time almost as poor as the cottagers around him, he associated on terms of perfect equality with friends of his own or of higher rank; and he was distinguished by his powers of conversation in the best literary society of London; but he thoroughly knew the feelings and thoughts of the farmers and shepherds who are his favourite personages. The Lake country was at that time to a great extent occupied by statesmen or small freeholders; though in a letter to Mr. Fox written in 1801 Wordsworth says that the statesmen are dying out; and numerous cheap schools provided nearly the whole population with the rudiments of learning. There was then no part of England, and perhaps there is no part now, in which self-respect, independence, and habits of intelligent observation were so widely diffused. There seems to have been neither extreme poverty, nor undue pressure of toil. When the hounds were out on Skiddaw "not a soul in the village" would stay for want of leisure to enjoy the sport. The "candid friend" quoted by Mr. Arnold could not have asserted that towards the end of the last century the people round the Lakes were materialized, vulgarized, or brutalized. In giving utterance to their feelings and experiences, Wordsworth is never tempted into the condescension of making lofty allowance for their prejudices or foibles. He has no objection to share, though perhaps with a meaning of his own, a fanciful local superstition:—

> Grey-bearded shepherd, thou has spoken well,
> Small difference lies between thy creed and mine.

The customs, the cares, and sometimes the sorrows of those among whom he grew up and with whom he lived, furnished him with all the materials he required, for no poet better understood the bent and the limits of his own genius:—

> The moving accident is not my trade,
> To freeze the blood I have no ready arts,
> 'Tis my delight alone in summer shade
> To pipe a simple song for thinking hearts.

It would have been still more accurate to say that observation supplied him with the knowledge of hearts or feelings. The thinking was his own. His household probably, like others in the district, contributed frugal alms to the support of the Old Cumberland Beggar, who suggested one of the earliest of his characteristic poems. Only one mind discerned by imaginative sympathy the true significance of the old mendicant on his incessant round. A less original poet would have contented himself with exciting pity for the helpless wanderer, bent double, so that he sees only the wheel marks on the road which he travels, and so slow in motion that the cottage curs grow tired of barking at him before he has passed their doors. Wordsworth describes his weakness and the dulness of his senses with touching minuteness of observation; but to him the poor outcast is mainly interesting through the unconscious influence which he is supposed to exercise on those whose bounty he receives:—

> While thus he creeps
> From door to door, the Villagers in him
> Behold a record which together binds
> Past deeds and offices of charity,
> Else unremembered, and so keeps alive
> The kindly mood in hearts which lapse of years,
> And that half-wisdom half-experience gives,
> Make slow to feel, and by sure steps resign
> To selfishness and cold oblivious cares.
> Among the farms and solitary huts,
> Hamlets and thinly scattered villages,
> Where'er the aged beggar takes his rounds,
> The mild necessity of use compels
> To acts of love.

For such involuntary services to his accustomed benefactors the poet hopes that he may receive at least a negative reward in keeping clear of confinement and the poor-house:—

> Be his the natural silence of old age!
> Let him be free of mountain solitudes,
> And have around him, whether heard or not,
> The pleasant melody of woodland birds.
> Few are his pleasures; if his eyes have now
> Been doomed so long to settle on the earth
> That not without some effort they behold
> The countenance of the horizontal sun
> Rising or setting, let the light at least
> Find a free entrance to their languid orbs:
> And let him, where and when he will, sit down
> Beneath the trees, or by the grassy bank
> Of highway side, and with the little birds
> Share his chance-gathered meal; and finally,
> As in the eye of Nature he has lived,
> So in the eye of Nature let him die.

The reflex action of gifts on the giver has been often illustrated by literature; but it remained for Wordsworth to notice the bond of union which the old beggar created among the dwellers in his little circuit.

Although Wordsworth displayed faint gleams of playfulness in *Peter Bell*, and while he was not incapable of indignant sarcasm, his intellectual constitution was imperfect in the almost total absence of humour. Milton had shown that the same defect is not incompatible with almost the highest order of poetical genius. But for his unfailing seriousness Wordsworth would have been sensible of the heaviness of his duller compositions; but, like all other poets, he must be judged by his best work and not by his failures. In the poems on which his fame must depend there is no need of the relief of gaiety and no room for humorous contrasts. The severe and pathetic simplicity of such pastorals as *The Brothers* and *Michael* admits of no variety of tone. The sonnets, which, with Milton's, are the best in the English language, for the most part conform to the rules of that kind of composition by the elaboration in each of a single thought. After elimination of most of the ecclesiastical series, and of much more than half the River Duddon series, Wordsworth's sonnets alone would go far to prove that Mr. Arnold is right in dwelling on the great amount of good poetry which is left when all the inferior work has been cleared away. Nevertheless the passages which cling most tenaciously to the memory are to be found neither in the

pastorals nor in the sonnets. They nearly all belong, as Mr. Arnold remarks of all the best poems, to ten out of the sixty years during which Wordsworth employed himself in making verses. Between 1798 and 1808 he was in the prime of his powers; but at the end of the decade he had twenty years to wait for the beginning of popular recognition. His manly and simple character was exempt from the morbid irritation of disappointment, and his unaffected confidence in himself was never disturbed. He was only mistaken in supposing that he could successfully prosecute in later years the task of his early manhood. It was impossible for him to recall the inspiration which had produced the poems on Yarrow, the tender descriptions of his sister in her influence on his childhood, the "Phantom of Delight," as he described his wife, the poems of "Matthew," and above all the recollections of "Lucy." Once only, when he had passed threescore, he was for the last time inspired by the familiar thought of Yarrow. The Ettrick Shepherd, who had accompanied him when he first saw the banks of the river, had lately died, and in the beginning of the illness which proved fatal had accompanied him on his second visit. Scott, Crabbe, and Mrs. Hemans had also died.

> Nor has the rolling year twice measured,
> From sign to sign, its steadfast course,
> Since every mortal power of Coleridge
> Was frozen at its marvellous source;
>
> The rapt One of the godlike forehead,
> The heaven-eyed creature sleeps in earth;
> And Lamb, the frolic and the gentle,
> Was banished from his lonely hearth.
>
> Like clouds that rake the mountain-summits,
> Or waves that own no curbing hand,
> How fast has brother followed brother
> From sunshine to the sunless land!
>
> Yet I, whose lids from infant slumber
> Were earlier raised, remain to hear
> A timid voice, that asks in whispers,
> "Who next will drop and disappear?"

SPENCER'S CEREMONIAL INSTITUTIONS.*

IN this instalment of the *Principles of Sociology* Mr. Herbert Spencer gives us a monograph complete in itself, of moderate length, and on a subject which affords considerable literary opportunities. The opportunities have been well used, and it needs no historical enthusiasm for primitive humanity to find the book as entertaining as it is instructive. At present it would be out of place, if not somewhat ungracious, to consider whether the elaboration of this volume is exactly in due proportion to its place in a general construction of the natural history of society. But one thing we may say in general terms, that in handling this subject it is safer to err on the side of too much than of too little. For the importance of ceremony and form in all archaic institutions is a thing which a modern reader finds it hard to understand, and even when understood, it is hard to give a full and lively belief to it. And though Mr. Spencer may now and then seem to take needless pains in heaping up evidence where a smaller selection of facts would have served as well, or to go far afield for instances that could be matched nearer home, we should remember that very possibly there are many readers for whom accumulation and far-fetched confirmation will not be superfluous. Indeed there are probably some who will not be persuaded even so.

The leading idea which Mr. Spencer develops and illustrates all through the book is that in the early history of society and institutions form has gone before substance. Selden's quaint comparison of ceremony to a penny glass that holds an excellent water, without which the water were lost, is not only just from the historical point of view, but hardly goes far enough. It is not that the essence was distilled first, and the glass devised for its safe keeping; the essence could not be made until there was a glass to keep it in. To state the position literally, and with all its apparent paradox, in Mr. Spencer's own words:—"What we think the essential parts of sacred and secular regulations were originally subordinate parts, and the essential parts consisted of ceremonial observances." The soundness of this general position is, to our mind, unassailable. It must not be understood that we commit ourselves to the support of all the explanations of ritual and manners which Mr. Spencer has propounded in detail. Some of these appear to us premature and others exceedingly doubtful. On many points we should think that the evidence is not yet in a condition to warrant the adoption of any hypothesis except as an avowedly provisional measure. We cannot share the confidence with which Mr. Spencer reconstructs, often on extremely slight indications, what might or must have been the conduct of primitive man under certain probable or possible circumstances. Indeed, "primitive man" is an abstraction; he is nowhere to be found in actual human knowledge. Ethnology, archæology, philology, comparative folk-lore may in vain be called on to produce him. Thus far we only know communities and races, past and present, which bear in their institutions marks of an antiquity that seems to us immensely remote. What evidence there is points to certain kinds of uniformity or monotony in the earliest phases of human society of which we can form any coherent notions. "Primitive man" is a compendious name for man as we conceive him to have existed in such a stage, and may be convenient if we do not let it beguile us into facile and baseless assumptions. We must not assume anything about the length of time that may have intervened between the first appearance of man (in a zoological sense) on the earth and the constitution of the first "primitive" society. Neither must we assume that "primitive man" is represented by existing savages. Nor yet must we suppose that the process of transformation from the "primitive" state to civilization has everywhere been alike. We know, in fact, as certainly as we know anything, that the rate and directions of development have been widely different in different races of mankind. And some of the most critical points in the early history of civilization are just those which for the present are most obscure. On the whole, therefore, our voice is with those who object to talking in general terms about "primitive man" at all. It is better to use words commensurate with our knowledge, and to be content with saying that certain virtues and accomplishments of civilized men are of relatively modern origin, and that, while these become fainter, certain other characters become more marked as we carry the explanation of man's history further and further back. Again, Mr. Spencer has already shown a tendency to underrate the complexity of social phenomena, and to jump at solutions which on the face of them are much too easy to be true. No doubt Mr. Spencer is justified if, as he thinks, he has found in ancestor-worship the master-key to all the problems of ancient societies. But we do not believe there is any one master-key, or that, if there is, Mr. Spencer has yet found it. Thus much by way of general warning; the controversial or controvertible points of Mr. Spencer's exposition are not at present raised in the most convenient form; and, in any case, they can be adequately discussed only by specialists.

There is one class of facts by which Mr. Spencer might have considerably strengthened his case if he had thought fit, but of which he has, for whatever reason, made little or no use. We mean the rigid formalism of archaic law. The exaggerated importance of obedience to formal, or, in Mr. Spencer's language, ceremonial rules, and the comparative unimportance of the merits of the case, are the most striking features in the early history of legal procedure. And, happily for the archæologist if inconveniently for the public, archaism clings to legal institutions with extraordinary tenacity, so that phenomena of this kind survive into the full light of civilization and can be studied at leisure. The art and mystery of special pleading, as practised in England down to the middle of this century, and much later in many of the American States, has a real analogy to the elaborate rites of sacrifice without which no Greek general ventured to order the most obviously necessary movement; and this, again, takes us back to the habit of thought expressed among modern savages by the authority of the medicine-man. In old Roman and Teutonic law we find actual and visible ceremonies, the due performance of which is essential for the attainment of the desired legal consequence. And everywhere we find procedure minutely worked out and defined while the substance of the law is yet largely deficient, and, where it is not deficient, is vague. Early codes and law-books, as recent workers in this field have pointed out, give to procedure and formalities an amount of space which to modern eyes is vastly disproportionate. No doubt special reasons may be assigned for this in some cases. Thus, if the oldest English books are very full on the process of compelling a defendant's appearance in court, we have to remember that the preliminary difficulty of getting the defendant to appear and submit to the jurisdiction was often a serious one. Still the broad fact remains.

Further, the legal history of Europe, almost down to our own time, is wonderfully rich in examples of the development, decay, survival, and transformation of ceremonies. Some of these might try rather severely one favourite doctrine of Mr. Spencer's, that no ceremony is in its origin symbolic. We wonder how he would treat the apparently symbolic forms of investiture which were exceedingly common throughout the middle ages, and of which investiture *per cultellum* was perhaps the commonest. He does just touch upon the equally common form of delivering part of a thing intended to be conveyed in the name of the whole; but he does not seem to be aware that this class of instances is but a single outcrop from a whole mine of wealth. In one or two cases Mr. Spencer's very partial use of legal history leads him into positive mistake. He cites the form of indictment for criminal offences as "against the peace of our lord the King," as showing that in early society the rights of individuals are ignored. The fact is that the theory of the king's peace marked the advance from a state in which redress by private warfare was allowed, and the rights of the public were ignored (that is, of all individuals except those directly offended), to a state in which some attempt was made to keep order by a common authority for the common good. Again, Mr. Spencer says, "We may suspect that the amount paid" in the Anglo-Norman period for suing out a writ "represented what had originally been the present to the king for giving his judicial aid." Here his caution is excessive. There is no doubt whatever of the fact. Neither need we go so far as the Kirghis for the custom of the judge taking presents from both sides. The discontinuance of that venerable custom is still regarded by many of the people of British India as an extraordinary and unintelligible innovation.

Another and more curious omission runs through Mr. Spencer's work. We have incidentally mentioned some Greek and Roman institutions. It is difficult to understand why Mr. Spencer has ransacked travellers' accounts of all the savages in the world, and

* *Ceremonial Institutions: being Part IV. of the Principles of Sociology.* (The First Portion of Vol. II.) By Herbert Spencer. London: Williams & Norgate. 1879.

has barely opened the records of classical antiquity which, although they mostly belong to times of well-advanced civilization, have preserved for us priceless evidences of archaic belief and usage. When we say mostly, we of course refer to the important exception of the Homeric poems. The result is that Mr. Spencer overlooks many interesting and difficult questions, and also misses opportunities of strengthening his illustrations. Thus he suggests that barter may have arisen from the exchange of presents. Strange to say, he does not adduce the exchange of arms between Glaucus and Diomedes, which is the very instance he wants. The exchange itself is made purely as a token of friendship; but the poet has in his mind the notion that in an exchange even of this kind there should be a certain equality of value, and comments accordingly:—"Howbeit Zeus then bereaved Glaucus of his wits, in that he exchanged with Diomedes the son of Tydeus golden arms for bronze, a hundred oxen's worth for nine." Another circumstance makes this neglect of the Greek and Roman world still more curious. M. Fustel de Coulanges has in his ingenious book *La Cité Antique* brought together a great quantity of detailed information as to Greek and Roman religion and ritual, which he uses to explain everything as derived from ancestor-worship, in a manner extremely like Mr. Spencer's own. We cannot give ourselves over to M. Fustel de Coulanges any more than to Mr. Herbert Spencer. But the industry and merit of his work are beyond question. There are the materials to Mr. Spencer's hand, collected and arranged by a thoroughly competent scholar; and they might at any rate have saved Mr. Spencer from relying, as he too often does when he enters on the Græco-Roman region at all, on obsolete or doubtful authorities.

We must remark that in general Mr. Spencer's authorities, both old and new, are too much counted and too little weighed. Not unfrequently, too, he heaps up weak proofs on strong ones. In the first chapter—illustrating the general statement that in the early stages of religion ceremony goes before righteousness (which is otherwise abundantly established)—he notes that "in the Rule of St. Benedict nine chapters concern the moral and general duties of the brothers, while thirteen concern the religious [ceremonial and ritual] ordinances." It is an obvious remark that the framers of such rules would not think it needful to insist at large on the rudiments of faith and morality which would already be binding on the members of the Order in common with all Christian men. But it must not be supposed that the criticism we have thought it proper to pass on Mr. Spencer's omissions and superfluities detracts from the worth of what he has actually done. The defects are perhaps inseparable from the method and conditions of his work; and, after all is said, he has collected a great mass of scattered facts and made them significant in the light of general ideas as no other living man could have done it. And for the present it is more needful to show that there is a general significance in matters hitherto supposed to be merely capricious than to interpret the meaning rightly in every case. This is a task for which Mr. Spencer is eminently fitted, and the praise due to his performance of it will be little affected by the corrections that subsequent research and criticism may bring to his particular hypotheses. We have no room to give any account of these. But the book is short enough to tell its own story, and no one interested in the subject should omit to read it for himself. We should like to add our suggestions on two points of detail. Mr. Spencer explains hand-shaking as derived from a mutual attempt of the parties to kiss hands in token of reverence—a strife of courtesy ending in a compromise. Is it not simpler to derive it (as others have done) from the offer of the unarmed right hand as a pledge of peace? And there is an addition to be made to the list of surviving ceremonial mutilations given by Mr. Spencer at the end of the third chapter. We mean the shaving which was practically compulsory in the learned professions in England till within a recent time, and still is so as regards the bar in France; and this in turn is connected with the still widely surviving clerical tonsure.

BOSWELL AT HOME AND IN CORSICA.*

THIS volume might almost have been entitled a Key to the Life of Dr. Johnson. In the Tour to Corsica, with enough of the same vanity to prove identity of authorship, there is, as in that greatest of biographies, the hero-worship which is always ready to gild the reputation of the hero at the expense of his admirer. There is even some of the just judgment of character which renders Boswell's illustrious work, both in its merits and its faults, the strangest phenomenon in literature. In the Correspondence with Erskine, the gaiety and the folly which help to produce the piquant contrast in the Life overflow. We cannot, however, say that we have detected in it any especial knowledge either of men or things. Dr. Birkbeck Hill is not inclined to judge Boswell harshly. Yet even he is "amazed at the downright impudence and audacity with which two young men ventured to publish to the world the correspondence which had passed between them when they were scarcely of age." The preface to the collection affirms that had any man found the letters directed, sealed, and adorned with postmarks, he would have read every one of them. We are disposed to think the finder of such a treasure would have speedily sealed it up again. The letters have the transient attraction which comes of youth, and a burning desire for fame. But their real merit is in their demerits. Every trait of egotism and self-consciousness and impulsiveness appears to furnish a clue to similar features in the biography which make the foil and the occasion for some weighty utterance of the moralist of Fleet Street. Had Boswell never done anything considerable, it would have been impossible to relish the continual tone of conceit in the letters to his early friend. But we read them with the knowledge which readers in 1773 did not possess, that it is Johnson's biographer who is demanding sympathy for as poor verses and epistles as could well have been composed. The two friends mock at one another's pretensions; but it is scarcely with an air of expecting that the world would join in the laugh. Writing what he probably intended at the time to print, and what he certainly did print, he exclaims with transparent sincerity, "Let our wit, my friend, continue to shine in a succession of brilliant sparkles; let there be no more distance between each flash of vivacity but what is necessary for giving time to observe its splendid radiance." Throughout these letters he is to be seen constantly, and with ever increasing pleasure, exploring the recesses of his own folly, as if there could be no more delightful study. He knows he is vain. "You and I, Erskine, are, to be sure, somewhat vain." But, he adds with meditative conviction, "We have some reason too."

"A fine flow of spirits" was the stock in trade with which Captain Andrew Erskine and Mr. James Boswell embarked on literature. It does not by itself carry a writer far. Even at the moderate altitude to which these letters soar the favouring impulse often fails; the poor young brains, overtasked by the effort to be witty and brilliant, become, as their dejected owners sometimes lament, "insipid, muddy, and standing-water-like." One of them apologizes in a letter of half-a-dozen lines for not having "six ideas at present," and for "a general lethargy of spirits and sense," because he is "pestered with noise." He is in an inn with half-a-dozen people in the room. "Never was there such a tame subjected performance as this!" The other cannot write because he is "lost in dissipation." He finds it "a very strange thing that I, James Boswell, Esquire, who am happily possessed of a facility of manners, to use the very words of Mr. Professor Smith, should ever be at a loss how to express myself; and yet, at this moment of my existence, this is really the case." Captain Andrew, as his friend calls him, must have been an agreeable companion, with the singular merit in his correspondent's eyes of having actually once "stood in awe" of James Boswell, Esq. He had in other respects some taste and much literary enthusiasm. But he seems to be memorable chiefly now for wearing "to the last gaiters and a flapped vest," and drowning himself in vexation for losses at cards. His "fine flow of spirits" led him only to a deep pool in the river Forth. The desire to maintain the level of a similar vivacity of temper, which was half physical and half intellectual, carried Boswell to the bottle. He died in early middle life, like Erskine, of perpetual claret. Fortunately for his fame, he had, unlike Erskine, something in his nature of the ivy. His talents which, it once seemed, might have been wasted on "Odes to Tragedy, by a Gentleman of Scotland," dedicated to the ingenious bard himself, were profitably invested in admiration successively of a thoughtful and generous patriot like Paoli and a practical philosopher like Johnson. In the exceedingly interesting Tour to Corsica, which Dr. Hill has with much judgment relieved from its original burden of Corsican history, Boswell may be seen training for the crowning undertaking of his life. If the least self-seeking of patriots and one of the most remarkable of administrators is remembered at all, the world must thank Boswell. Paoli found Corsica unutterably oppressed by the Genoese, who, exclaimed Horace Walpole twenty years before Boswell wrote, "make a commonwealth the most devilish of tyrannies." Justice was bought and sold. Feuds were fomented from the suzerain State's dread of Corsican union. A petition presented to the King of France in 1738, which Dr. Hill quotes, stated that "under the last sixteen governors no less than twenty-six thousand Corsicans had died by the hands of assassins." The Corsicans rose in vain against their oppressors. The Republic of Genoa obtained the aid, first of the German Empire, and then of France, to restore its authority. France finally bought up the Genoese claims. Voltaire thought it a profitable transaction for both, if only "les hommes ont le droit de vendre d'autres hommes." Thenceforward, with an interval of two years from 1794 to 1796, during which Corsica was under British protection, the island remained, as it still remains, French. But for fourteen or fifteen years after 1753 the whole interior of Corsica belonged to the Corsicans.

That was the period of the supremacy of Pascal Paoli. Paoli was the son of a former Corsican leader. He cooped up the Genoese within a few coast forts. Without attempting to form a regular army he secured by personal devotion to himself unity of military operations. He even had the moral courage to make assassination, on whatever pretence, capital. The horrible crime of collateral assassination, as was termed the custom of vengeance on the relatives of an enemy who had escaped beyond reach, he put down by erecting a pillar of infamy to the memory of the murderer. Boswell mentions a case in which torture had been inflicted to extort a confession of murder; and Dr. Hill remarks in a note upon the fact as a "great blot on Paoli and the Corsican patriots." He seems to attribute it in some way to the Inquisition. But, as

* *Boswell's Correspondence with the Hon. Andrew Erskine, and his Journal of a Tour to Corsica.* Edited by George Birkbeck Hill, D.C.L. London: De la Rue & Co. 1879.

he himself observes, torture was still employed in capital cases to force confession in France and Protestant Holland. We are a little surprised that he should not have referred to the defence, sophistical as it was, which Boswell himself in the Life records Johnson to have made for the practice in the latter country. Paoli, at all events, cannot be reproached for not having made Corsica in ten years outstrip Holland and France in judicial humanity. The mere fact that Paoli maintained an unquestioned predominance over a race like the Corsicans indicates extraordinary qualities. He succeeded, it is clear from Boswell's narrative, through perfect devotion to the freedom of his island, love for and sympathy with his fellow-countrymen, combined with infinite superiority to them in intelligence, with a noble pride, and with a resolution never to countenance their vices and corruptions. "I asked him," writes Boswell, "how he could possibly have a soul so superior to interest. 'It is not superior,' said he; 'my interest is to gain a name. I know well that he who does good to his country will gain that; and I expect it. Yet, could I render this people happy, I would be content to be forgotten. I have an unspeakable pride. The approbation of my own heart is enough.'" A scholar who had ranged through classical literature, and was acquainted with the masterpieces in most modern languages, he towered mentally far above his followers. But those acquired gifts did not tend to make him despise them. He admired as sincerely as he was admired. "Go among them," he used to say to Boswell; "forget the meanness of their apparel. Hear their sentiments. You will find honour, and sense, and abilities among those poor men." "The Corsicans," he gloried, "have a steady resolution that would amaze you. I wish you could see one of them die." Boswell, who delighted above all things in executions and similar horrors, probably echoed the wish. Never did a ruler understand better the art of playing upon the hearts of a people. But it was done by virtue of sharing the same emotions which moved the crowd; only in him they were refined and elevated. He had studied metaphysics, and explored the scientific bases of theology and morality; but the real safeguard which had kept him pure in life while an officer in the lax Neapolitan army, and about a licentious Court, was the preoccupation of his constant purpose to be his country's deliverer. The friend of Rousseau, he was yet the most orthodox of believers. Frederick the Great was one of his heroes for his splendid achievements against Austria; but he could see nothing beautiful in the scepticism of a genius. Speaking of the King's epistle to Marshal Keith, he remarked, with delicate irony, "C'est une belle consolation pour un vieux général mourant, 'en peu de temps vous ne serez plus.'" He had no love for "les diseurs de bons mots," he told Boswell; but Boswell heard *bons mots* from him. For Corsica he was an enthusiast. His heart was so full of his country that love of Corsica gifted him with a kind of second sight where its interests were concerned. Boswell believed, and readers of Boswell will believe, that there was no pious fraud in this. He himself said, "I can give you no clear explanation of it. I only tell you facts. Sometimes I have been mistaken; but in general these visions have proved true." His mind doubtless continued in sleep the calculations which absorbed it waking, and leaped to conclusions without halting at premisses. The faculty did not surprise his Corsicans. Of course their "General," "questo grand' uomo mandato per Dio a liberare la patria," as they used to describe him to Boswell, was a seer. One species of second sight he possessed of no supernatural pretensions, but at least as useful. He had learned to read minds through faces. We wonder how many of our readers remember the story of his choice of a hangman. From want of a hangman Paoli, when he took the Government, had been obliged to shoot criminals, and Corsicans have no objection to be shot. At last a Sicilian chanced to come with a message. "Ecco il boia," cried Paoli, "behold our hangman." He bid them ask the man if he would accept the office; and his answer was:—"My grandfather was a hangman; my father was a hangman; I have been a hangman myself, and am willing to continue so." Boswell, who with shuddering delight visited the poor cowering wretch, was informed that one death by his abhorred hands had more effect than twenty executions by firearms. So entire was Paoli's trust in himself and his people that he could not bear the thought even of owing freedom to foreign aid. He desired English friendship rather than an English alliance. "The less assistance," he said to Boswell, "we have from allies, the greater our glory." "We may have foreign Powers for our friends; but they must be friends at arm's length." When we recollect how at a later period England, in accepting the gift of Corsica, appointed Sir Gilbert Elliot Viceroy, and not Paoli, we are not astonished at Paoli's prescient doubt of the working character of a league which should transfer the dominant influence in affairs to a foreign State. He was even jealous that Corsica had to rely on a Sicilian hangman. He rejoiced when a Corsican was willing to have his capital sentence commuted for the functions of executioner.

Notwithstanding all his cares of chief, and Corsican chief, and though beset by daily and nightly peril from Genoese assassins, who had to be warded off by vigilant sentries and half-a-dozen fierce dogs within and without his chamber, Paoli is described by Boswell as showing invariably "the most perfect ease of behaviour." We suspect Boswell does not mean by this exactly the "facility of manners" for which Adam Smith commended him. The general was always accessible. He would, Boswell declares, have been "a hero to his *valet de chambre*." Boswell himself says it, and he must have known. To pass the ordeal of the great original of modern "interviewers" and never be ridiculous to him, or, what is more important, to his readers, demonstrates an exceptionally great and genuine character. Whatever his fortune in life he became it. He ruled by right divine at Sollacarò. In the midst of the adulations of Versailles and Paris, when invited thither by Mirabeau, he preserved his self-respect. The only charge which could be brought against him by Walpole as a courtier at St. James's was "the simplicity of his whole appearance." Walpole had apparently expected to meet a brigand chief with dagger and pistols in his waistband. He could sustain a conversation with Dr. Samuel Johnson in the presence of the avowed worshipper of both. It is a pleasure to refresh our recollection of so noble a personage. Yet we must confess that the traces of Boswell's vanity and egotism are to the full as engaging as the spectacle of his host's serene virtue. Even the first sentence is charming:—"Having resolved," he writes, "to pass some years abroad for my instruction and entertainment, I conceived a design of visiting the island of Corsica." The fact was he had been sent by his father simply to study civil law at the University of Utrecht, and after a few months played the truant in Italy. The Corsicans took him for an envoy sent to negotiate a treaty with them. He disclaimed the honour. It may be easily imagined how Boswell would disclaim any honour; "and I was considered a very close young man." "I therefore just allowed them to make a minister of me." He had expected to find savagery, and was astonished to meet with an engraving after Raffaelle. Johnson could not have surpassed his comment on the execution of the print:—"There was no necessity for its being well done. To see the thing at all was what surprised me." At Bastelica he expatiated to a crowd on the beauty of simplicity, and warned the Corsicans, who live chiefly on chestnuts, against luxury. Dr. Hill cruelly appends, by way of gloss, an extract from a subsequent letter of the preacher to his friend Temple:—"I give admirable dinners and good claret; and the moment I go abroad again I set up my chariot." On his first introduction the General looked at him "with a steadfast, keen, and penetrating eye, as if he searched my very soul." Boswell felt a little uncomfortable till he became conscious, we suppose, that Paoli understood he was no hero. "I made myself known to him," he writes; and an odd discovery must Boswell's character have been to this king of men. "My flow of gay ideas relaxed his severity." Paoli must indeed have soon come to the bottom of that innocently babbling brook. But he acted as if he had for visitor a future statesman. Boswell, when he rode out, was mounted on the General's own horse, with rich furniture of crimson velvet, and with broad gold lace; "and I had my guards marching along with me. I allowed myself to indulge a momentary pride in this parade." Visions of that rich furniture and broad gold lace may have consoled him for many rude rebuffs the world had in store for him. "I got," he writes later on, "a Corsican dress made, in which I walked about with an air of true satisfaction." The "good peasants and soldiers used to call me the ambasciatore Inglese." He had apparently soon left off repudiating the distinction; for, "I bid them hope for an alliance with us." Still, being a reputed ambassador did not prevent him from playing to them upon the German flute. One morning he sang to them Garrick's song, "Hearts of Oak." They were enthusiastic; "it was quite a joyous riot." He ceased to be a diplomatist. "I fancied myself to be a recruiting sea-officer." It is hard to say which is the more comic picture, Boswell as an ambassador or Boswell as a first lieutenant. The former, however, was his favourite character in Corsica. He gravely consulted Paoli on the matter. "Talking of various schemes of life fit for a man of spirit and education," as obviously was Boswell, "I mentioned to him that of being a foreign Minister." Paoli replied, with infinite gravity, that "he thought it a very agreeable employment for a man of parts and address during some years of his life." At another time he was the travelled and sated man of the world who had "exhausted all the sweets of his being." "I told him that I had almost become incapable of taking a part in active life." With infinite courtesy Paoli condescended to treat the depression as of real consequence, and reasoned him out of it. A finished courtier like this must, indeed, have "smiled a good deal when I told him that I was much surprised to find him so amiable, accomplished, and polite."

No doubt, however, Paoli found Boswell a pleasant companion, and understood enough of the English nature to appreciate the value of a nimble tongue which could circulate among Englishmen—if not, as he suggested to Boswell, "at your Court"—a belief that Corsicans might be allowed to free themselves without danger to civilisation. Boswell, on his side, was collecting materials, noted down carefully every night, for a book. To be an author was more to him who knew himself than to most men. "To preserve an uniform dignity among those who see us every day," avows Boswell in his preface, "is hardly possible. The author of an approved book may allow his natural disposition an easy play, and yet indulge the pride of superior genius when he considers that by those who know him only as an author he never ceases to be respected." He had only too accurate a prevision of his own defects when he remarks that the writer of "a book approved by the world has established himself as a respectable character in distant society without any danger of having that character lessened by the observation of his weaknesses." When a third edition was demanded he became yet more certain that he might indulge his folly as freely as an Antinomian without disparagement. He was the friend of Paoli, and therefore "set free for ever from a slavish timidity in the presence of great

men." He had the infallible testimony of "my revered friend, Mr. Samuel Johnson," to the "wise and noble curiosity which had led him where perhaps no native of this country ever was before." He had sold two editions of his Tour, and was issuing a third. His preface to the third edition concludes:—"When I first ventured to send this book into the world I fairly owned an ardent desire for literary fame. I have obtained my desire, and whatever clouds may obscure my days, I can now walk among the rocks and woods of my ancestors with an agreeable consciousness that I have done something worthy." Well might his revered friend have written about the same time: "I wish you would empty your head of Corsica, which, I think, has filled it rather too long."

But the present generation has had no opportunity of being tired to death with Boswell's stories of Corsica, or with the spectacle of his airs as he paraded dressed as a Corsican chief. It may well be grateful to Dr. Hill both for recalling to its knowledge a very picturesque narrative, and for himself telling the story of the Corsican war, or wars, of independence with clearness and vigour. In the introduction to the Correspondence between Boswell and Erskine there is something still better in the results of a ripe acquaintance with the Johnsonian cycle of literature and society. Everywhere throughout the volume signs are visible that the whole has been a labour of love. The printer has shown taste in reproducing the original title-pages. Even the spelling has been benevolently preserved. Not a final *k* after *c*, or a single "*u* in the last syllable of words which end in our" has been omitted. Deference has been paid to Boswell's expressed hope that, "should this work at any future time be reprinted, care will be taken of my orthography." Faith has been kept in more important matters. The Introductions and the Notes comprise all that is necessary for the explanation of obscure allusions; but the former are carefully restricted to preparing readers for the enjoyment of the narrative and the letters; the notes never vie in rivalry with the text.

ORMSBY'S POEM OF THE CID.*

THIS is in many respects an excellent little book. It is, in fact, so good and, as far as it goes, so thorough that our main criticism of it has to be put in the form of a serious regret that Mr. Ormsby did not see his way to making it much longer and more complete. He tells us that the book was not intended for students of Spanish literature. If so, it is difficult to understand what audience it is to address successfully. For while the student will grumble at the book's incompleteness, the general reader will scarcely be beguiled into swallowing so much information as is here given about a subject wholly remote from him merely because the book is short and the author's learning concealed as much as possible. There is just now no general public in England for Spanish themes of a purely literary or antiquarian kind. Spanish ways and thoughts, especially the ways and thoughts of old Spain, are so far removed from those of the ordinary Englishman that no dressing up can make the literature which embodies them otherwise than stale, flat, and unprofitable to him. It was otherwise in the sixteenth and seventeenth centuries, when the most vital everyday politics of England were liable at any moment to be crossed and shaped by those of Spain. The Spaniard and his life were then matters of real interest, however odious and unpalatable, to a large English public; and endeavours to popularize information about them were well worth the making, as is abundantly proved by the crop of books concerned with Spanish matters of all kinds printed in England between 1550 and 1650. But nowadays times are changed; and, with an exception or two here and there—Mr. Grant Duff writing on Señor Castelar, or a lively book of travels which promises to be practically useful, or an occasional translation of a Spanish novel—the general English reader has neither eyes nor ears for anything Spanish. Southey thought otherwise. His Chronicle of the Cid was directed to the general reader; so was Lockhart's work; and in both cases every consideration of permanent value was sacrificed to the pursuit of that unsatisfactory being who has long ago deserted Southey and is now fast deserting Lockhart. That so competent a student as Mr. Ormsby should have chosen to work on the same unfruitful lines is real matter for disappointment. Instead of bringing down his book to the level of a supposed general audience which does not exist, it would surely have been far better to appeal to an audience that does exist—to that small body of persons in England, well known to the London booksellers, who are fanatics for all that concerns old Spain, and who, at present compelled to look abroad for all the information worth having on their favourite subject, would have welcomed with enthusiasm a serious and exhaustive English book on such a topic as the poem of the *Cid*. Nor would such a book have appealed to English students only. It would have reached a European public, and not a particularly small one. In Germany and France, not to speak of Spain itself, where Ticknor's great book has been eagerly appropriated and made use of, and where all foreign work on Spanish literature is carefully watched by a large number of "aficionados," there are circles of readers who would have ensured its success if Mr. Ormsby had chosen to write it. At this moment, indeed, such a book is in process of writing in Germany.

* *The Poem of the Cid.* A Translation from the Spanish, with Introduction and Notes, by John Ormsby. London: Longmans. 1879.

We have just received the first part of a new edition of the *Poema* by a German student, Herr Karl Vollmöller, which contains the text carefully reprinted from the only existing MS., an introduction, notes, and a glossary, being announced as to follow in the second part. So far so good. It is well that this should be done by whatever competent person will do it. But a little change of aim, and some months' more labour on Mr. Ormsby's part, would have given an Englishman the credit of the task, and, to judge from the many admirable literary qualities displayed in the little book before us, would have secured to the reader, not only learning and accuracy in its fulfilment, but adequate literary form and expression to boot.

It is time, however, to turn from Mr. Ormsby's omissions to his performance. He gives us a mixed prose and verse translation of the poem, an introduction dealing with the various larger critical questions connected with it and with its hero, and four short appendices on the ancestors and descendants of the Cid, the chronology of his life and times, his titles, and the structure and versification of the poem. The introduction adds little to the knowledge of those who are already familiar with the Cid literature, but it is an excellent summary of the chief results of that literature, and shows that Mr. Ormsby has not only read his books, but digested them. He makes one point, indeed, which, if not altogether a new one, has not, as far as we remember, been so well stated before. Ferdinand Wolf long ago pointed out, in correction of Bouterwek, that the object of the author of the *Poema del Cid* was by no means that of writing a chronicle of his hero's life and doings after the common pattern of the *chansons de geste*. The narrative concerns only the latter portion of the Cid's career—that is to say, the adventures and campaigns following his last exile from Castile in 1081, and culminating in the conquest of Valencia in 1094; and it is not upon these campaigns, in spite of the poet's genuine love for fighting scenes and Homeric power of painting them, nor even on the conquest of Valencia itself, which is described in a few lines, that the true emphasis of the poem rests. It was really written for the sake of the story of the Cid's daughters and their marriages, which occupies its second half, and to which the first half is practically introductory. The first object of the author was to trace the upward progress of the Cid from the humiliation inflicted upon him by his original sons-in-law, the Infantes of Carrion, to the glory reflected on the hero and his race by his daughters' second marriage with the Infantes of Navarre and Aragon; just as the underplot of the poem, so to speak, describes his rise from the position of a poverty-stricken exile to that of the rich and powerful ruler of Valencia. The true climax of the poem is reached when the poet exclaims, after chronicling the second pair of weddings—

Hoy los reyes de Espanna sos parientes son!

To-day the kings of Spain are his kinsmen—

a famous and disputed line which led Wolf to the conjecture that the poem was recited as an epithalamium at some royal wedding, probably that of Blanca of Navarre, the Cid's great granddaughter, to Sancho III. of Castile in 1151. In his description of the first aim of the poet, Mr. Ormsby is at one with previous critics. He points out that the incident of the Infantes of Carrion is almost certainly wholly unhistorical, and was therefore either invented by the poet or at least shaped by him out of earlier ballads, for the sake of heightening his climax and exalting the final good fortune of his hero. Not, however, for this purpose only. There comes in a second motive to explain this story of the Infantes, which is well and freshly put by Mr. Ormsby, and which requires to be understood before we can appreciate the full merit of the poem and its unique position in the history of mediæval literature. "It is difficult to resist the impression," says Mr. Ormsby, "that the poem is in fact an expression of Castilian spirit, finding vent not only in the exaltation of a representative Castilian hero, but also in the depreciation of the hereditary enemies of Castile, represented by the highest of the nobility of Leon." It is, in fact, a political satire on Leon and the Leonese nobility, written by a Castilian at a time when before the union of Leon and Castile under St. Ferdinand a state of chronic rivalry and jealousy existed between the elder aristocratic Leon and her younger rival Castile. Not only are the Infantes of Carrion, members of the historical and powerful Leonese house of Gomez, represented as base and cowardly, urged by mercenary motives to ask the Cid's daughters in marriage, and then, as soon as the Cid's generosity has enriched them, carrying off their brides to a place of safety, where, out of reach of their father's strong arm, they may insult and desert them at pleasure, but the "whole clan or faction to which they belong is stigmatized as lawless, violent, and treacherous." The more carefully the poem is read the more evident does this purpose of the author become. His whole work is seasoned by it and by the rough spontaneous humour which it breeds in him. And when we come to observe how he fits his subject to this double aim of glorification and satire; how, as the figure of the long-bearded Campeador grows under his hands to greater stature and splendour, he groups around it the boasting and greedy faction of his Leonese enemies, sketched with Chaucerian ease and Chaucerian realism; and with what happy judgment, on the whole, he has chosen and arranged the lesser incidents of his long story, we shall perceive the importance of this unknown *juglar* and his work in the history of modern literature. Such a performance is far above the level of the ordinary rhymed chronicle or romance. There is dramatic power in it; the consciousness of the whole to be attained governs the

treatment of the parts; and the impression left at last upon the reader is one of extraordinary unity and vividness. Without endorsing Southey's extravagant and meaningless description of it as "unquestionably the finest Spanish poem," we may well acknowledge that the poem of the Cid, dating as it does from the latter half of the twelfth century, deserves a place among the five or six most remarkable compositions of early romance literature. In Spain, at any rate, the same note of realistic power is scarcely heard again, unless it be in some of the strange poems of the Archpriest of Hita or in the prose "Conde Lucanor," until the opening of her great age.

In the matter of the date of the poem Mr. Ormsby follows the great majority of his predecessors, who, with a few exceptions—notably Professor Dozy of Leyden—have placed it rather in the latter part of the twelfth than in the first half of the thirteenth century. As is well known, the question of the date of the poem, at any rate of the unique MS. which preserves it to us, is complicated by the fact that the lines which were meant to contain it have suffered an erasure, whether purposed or accidental cannot now be determined. They run thus:—

> Quien escrivio este libro del Dios parayso. Amen !
> Per Abbat le escrivio en el mes de Mayo
> En era de mil e CC • XLV años es el romanz fecho.

the four concluding words of the passage, which are important, having been overlooked and omitted by Sanchez in the original edition of the poem. It is impossible to discuss the details of the question here; but it has been generally held either that the copyist wrote a *c* too many and then erased it, or that the vacant space was filled with the conjunction *e*, which has been scratched out either by the copyist when he perceived it to be unnecessary or by some accidental cause. Should it, however, be decided that the date intended by the writer of the MS. was 1307 (deducting the thirty-eight years of the Spanish era), the question of the date of the poem itself, say the critics, is not affected by the decision, for the poem must be older than the *Estoria de España* of Alfonso X., in which it is largely quoted, and which was written before 1260. There are linguistic grounds also—though in our opinion they are not convincing ones—for assigning to the poem of the *Cid* a priority of at least half a century over the poem of Gonzalez de Berceo, who is known to have been writing towards the middle of the thirteenth century. So that if the date be 1307, it can only apply to the MS. In this state of the question it is interesting to notice that Herr Vollmöller, in his new edition of the *Poema*, prints the date "mill e C.CCXL.V." without any sign of erasure. This looks as if a competent paleographist, as we know Herr Vollmöller to be, had satisfied himself that the writer of the MS. meant it to stand so, and that the erasure is not to be traced to his hand. If this is so, and if again the date thus recovered has no relation to the date of the poem, but merely concerns that of the MS., the use of the words "es el romanz fecho," which is the formula of composition in old Spanish, is certainly extraordinary.

Mr. Ormsby's English rendering of the poem, from the point of view with which he undertook it, is admirably done. If anything could induce the general reader to take an interest in the *Poem of the Cid*, Mr. Ormsby's method of translation might succeed in doing it. He has thrown the best and most poetical passages of the poem into verse which, with very few exceptions, reproduces the original as faithfully as any verse translation can; and he has connected these passages in verse by a condensed prose translation which preserves the language and the order of the poem, while it avoids the difficulties and corruptions of the text, and cuts out repetitions. Mr. Ormsby's omissions from this portion of his work are generally easily intelligible to any one following his footsteps text in hand. Of course they damage the book for the student; but from a literary point of view they are almost always justified. One or two of them, however, are puzzling. In the prose portion, for instance, it is not easy to understand why the short characteristic prayer of the exiled Campeador, uttered as he leaves his native Castile for the Morisma, should have been omitted; and in one of the poetical sections, that dealing with the defeat of the Count of Barcelona by the Cid, several touches of satire in the original have been dropped out to the disadvantage of the general picture. Still, when all slight deductions are made, Mr. Ormsby's translations remain incomparably the best yet made in English from the *Poema*. They are accurate, unpretentious, and yet readable—a pleasant contrast to the worse than unsatisfactory versions of Frere of which Mr. Ormsby has many true words to say. The few notes which are appended to them are mostly topographical, and are of great interest. Mr. Ormsby has gone minutely over the whole ground of the *Poema*, and has cleared up not a few debated points with which the second-hand information of its French editor M. Damas Hinard did not enable him to deal successfully. Two small maps, one of the twelfth-century route from Burgos to Valencia, and another of the environs of Valencia, would, we venture to suggest, have made the book complete in this respect.

One rather important point remains to be noticed before we part with a book which has given us much pleasure in the reading. Mr. Ormsby mentions the charter of Avilés in a note to the introduction as dated 1155, and as, therefore, probably older than the poem of the *Cid*. In Ticknor's time it was, indeed, commonly held to be the oldest piece of Spanish existing. Since 1865, however, it has been acknowledged by experts to be a forgery of the thirteenth century, and ought long before this to have been generally deposed from its old place. A complete statement of the case may be found in the *Discurso* on the subject read by the Spanish scholar Fernandez Guerra before the Madrid Academy in that year, and afterwards published with most elaborate appendices, including facsimiles of the *Fuero* itself, as well as of other illustrative documents.

CONFIDENCE.*

MR. HENRY JAMES'S fictions seem to us at this moment to follow each other in course of publication a little too rapidly for the full enjoyment of their attractions. His stories are apt to dwell in the memory, and it seems to us but the other day that we had the pleasant task of writing about his collection of tales called the *Madonna of the Future*; and with the taste of that, so to speak, yet in our mouths, we have *Confidence* put before us. To carry further a gastronomic metaphor, we might not appreciate the flavour of caviare if it were a thing of constant recurrence so well as by consuming it only now and then. Although it certainly cannot be said of Mr. James's works that they are caviare to the general, in the sense that they are not popular, if "the general" stands for the reading public who get their supplies from the circulating libraries, yet it may be doubted if more than half the people who read his books appreciate, or try to appreciate, their finer qualities. A long course of Mérimée or of Tourgenieff might be trying to a conscientious reader, and, as has before been pointed out in these columns, Mr. James has more affinity with those two writers than with any English-writing novelist of whom we can think. In other words, Mr. James's fiction has the quality of rarity both in thought and expression, and in his branch of art frequent production is a disadvantage, not perhaps to him or to his public, but to his reviewer. We remember once to have heard a young man infected with the æsthetic cant of the day profess that he objected strongly to the exhibition of fine works in picture galleries because it "vulgarized" them. This of course was rank nonsense; but it may not be altogether paradoxical to say that such delicate work in writing as Mr. James's suffers from being put too continuously before his readers. One cannot take in a good novel so readily as a good picture, and, like the writers to whom he has been compared, Mr. James has a way of always leaving something not unimportant to the imagination of his readers. He works out his problem to a certain point and then leaves them to deal with it as they will, and in *Confidence* he has sprung a new puzzle upon us almost before we had forgotten to be "intrigued" over those which he last set before us. It must be said that in his present book the puzzle takes a comparatively mild form. One marriage which we have been looking forward to has taken place; another, apparently made with some rashness, has, we may presume, been turned from discontent to happiness; and we are only left to wonder what is the exact nature and tenor of the unusually long letter which the older writes to the younger bridegroom who has been for years his closest friend, and whom he has lately regarded, not altogether unjustly, with feelings which could not be completely friendly. It may well be that only a minority of Mr. James's public will trouble their heads over this matter; but we are inclined to think that in this minority will be found his most faithful and appreciative readers, to whose feelings he might with advantage make some concession. However, in certain things, and perhaps in such things as this, the artist must be allowed to be his own best critic; and that Mr. James is an artist will not be denied.

It is one of the author's characteristics to open his books by presenting one of his chief characters in circumstances and scenery which serve to give a general idea of his nature. "The American," if we remember rightly, was discovered in the galleries of the Louvre, oppressed by an "æsthetic headache." The hero of the present work is also an American, but of a very different type. "The American" was an admirably studied specimen of a self-made man, possessed of an innate strength and dignity, set off by innumerable great and little traits of character, which were difficult to analyse, but which all combined to produce a harmonious and pleasing result. The American, Bernard Longueville, who takes the principal part in *Confidence* belongs to the naturally well-off and educated class of his countrymen. Dignity, if not strength, has come to him with his bringing-up; and his is a more complex, if a less striking, character than that of the hero of the novel by which, as far as English readers were concerned, Mr. James first made his mark. Longueville, when we meet him in the first page of the book, has been spending the winter in Rome:—

> He had travelled northward with the consciousness of several social duties that appealed to him from the further side of the Alps, but he was under the charm of the Italian spring, and he made a pretext for lingering. He had spent five days at Siena, where he had intended to spend but two, and still it was impossible to continue his journey. He was a young man of a contemplative and speculative turn, and this was his first visit to Italy, so that if he dallied by the way he should not be harshly judged. He had a fancy for sketching, and it was on his conscience to take a few pictorial notes. There were two old inns at Siena, both of them very shabby and very dirty. The one at which Longueville had taken up his abode was entered by a dark, pestiferous archway, surmounted by a sign which at a distance might have been read by the travellers as the Dantean in-

* *Confidence.* By Henry James, Junior. 2 vols. London: Chatto & Windus. 1880.

junction to renounce all hope. The other was not far off, and the day after his arrival, as he passed it, he saw two ladies going in who evidently belonged to the large fraternity of Anglo-Saxon tourists, and one of whom was young and carried herself very well. Longueville had his share—or more than his share—of gallantry, and this incident awakened a regret. If he had gone to the other inn he might have had charming company; at his own establishment there was no one but an æsthetic German who smoked bad tobacco in the dining-room. He remarked to himself that this was always his luck, and the remark was characteristic of the man; it was charged with the feeling of the moment, but it was not absolutely just; it was the result of an acute impression made by the particular occasion; but it failed in appreciation of a providence which had sprinkled Longueville's career with happy accidents—accidents, especially, in which his characteristic gallantry was not allowed to rust for want of exercise.

We learn, further, of this personage—who becomes more interesting in proportion to the unexpected influences brought to bear upon him—that "he was clever indeed, and an excellent companion; but the real measure of his brilliancy was in the success with which he entertained himself. He was much addicted to conversing with his own wit, and he greatly enjoyed his own society. Clever as he often was in talking with his friends, I am not sure that his best things, as the phrase is, were not for his own ears. And this was not on account of any cynical contempt for the understanding of his fellow-creatures; it was simply because what I have called his own society was more of a stimulus than that of most other people." In spite of this he was "a very sociable animal"; and after this it will be readily "admitted at the outset that he had a nature which seemed at several points to contradict itself." The description reads like a study from life, and the impression that this is so is deepened as the story, or rather the finely-touched narration of events which hang together, goes on. It must not be inferred from this that there is anything bald, or, to use a paradoxical phrase, too life-like, in the following out of Longueville's character. Mr. James is a singularly keen observer, but he has plenty of the artistic instinct and skill which prevent a novelist from producing an impression of tiresome adherence to the naked result of observation. There is probably more than one Longueville in the world, and yet Mr. James's Longueville never fails to be interesting.

More remarkable, perhaps, is Mr. James's skill in the treatment of Gordon Wright, who is more or less to Longueville what "Charles, his friend," is to the hero of a certain kind of comedy, and who also affords an admirable foil to Longueville's more finely-strung nature, to which, with an odd contradiction which the author's fine faculty of observation has happily seized, the more robust one of Wright is ever prone to turn for counsel. These characters are both American. Mr. James is less happy in his representation of Captain Lovelock, who, in spite of a fortunate touch here and there, is little more than the typical army Englishman of a hundred English novelists. That he should be represented as heavily bearded may perhaps be regarded as a sin of mere detail—or perhaps the author may advance the theory that the length of his beard was in proportion to that of his leave. But in one scene we find what we cannot but regard as a blunder, which is a thing very uncommon in Mr. James's work. Longueville and Lovelock are on those terms of close acquaintance which spring from constantly meeting in the company of the same people at the same place; the place in this instance being Baden-Baden in the gambling days. Lovelock is supposed to be, if not very wise, well born and well bred. The two meet after the party of ladies in whom both are interested have suddenly and without warning moved their camp. "'Damn it, they're going—yes, they're going,' said the Captain, after the two young men had exchanged a few allusions to current events." The Captain says "damn" so often that one could almost think the author had been studying old-world French caricatures just before he wrote his book, and that stray recollections of them had stuck to him. After this he falls into a confidential mood, in which he recounts among other things his bad luck "at those filthy tables." He has lost heavily, and Longueville has just won a quantity of money at the same tables the winning of which has given him no pleasure; Lovelock accepts from him a loan which both know will not be repaid, and which both know will be employed at "those filthy tables." What is more odd is what will be found in the following quotation:—

I'll take fifty pounds with pleasure, thank you, and you shall have them again—at the earliest opportunity. My earliest convenience—will that do? Damn it, it *is* a convenience, isn't it? You make your conditions? My dear fellow, I accept them in advance. That I'm not to follow up Miss Evers; is that what you mean? Have you been commissioned by the family to buy me off? It's devilish cruel to take advantage of my poverty! Though I'm poor, I'm honest. But I *am* honest, my dear Longueville; that's the point. I'll give you my word, and I'll keep it. I won't go near that girl again—I won't think of her till I've got rid of your fifty pounds. It's a dreadful encouragement to extravagance, but that's your look-out. I'll stop for their beastly races, and the young lady shall be sacred.

This from a writer of Mr. James's power is little short of astounding when the conditions of Lovelock's existence are remembered. But the drawing of this character is throughout, it seems to us, unworthy of Mr. James's talent and reputation.

With one of the women of the story, Miss Evers, the author is as successful as he has ever been; the character is well conceived and admirably executed in every detail. But with the heroine, Miss Vivian, he seems less successful. He tells us at once too much and too little of her. He has aimed, it would appear, at painting such a strange character as Musset loved to illuminate with the brilliant flashes of his undated comedies. To try this in a novel of modern life is a bold experiment. Mr. James seems to us to have lost himself to some extent in the intricacies devised by himself. Brilliant flashes are thrown from time to time upon Miss Vivian's nature; but they scarcely suffice to give any definite and abiding impression. The key to the character is no doubt possessed by the author; but he does not hand it on to the reader. Mrs. Vivian's character, on the other hand, strikes us as being an ordinary one, which its depicter has vainly attempted to invest with mystery. These are the faults which we find with a novel which can, in spite of them, be recommended to all who care for Mr. James's fine style and method. We do not propose to give any clue to its story, for, as is usual with Mr. James, that part of his work hangs entirely upon his treatment of character, and to tell it merely as a succession of facts would be obviously unjust. If we might venture to give a word of counsel to the author, it would be to avoid all temptation to deliberate obscurity.

JULIAN THE APOSTATE.*

MR. RENDALL has done well to reprint his Hulsean essay in an enlarged and amended form. The strange career of "Julian the Apostate" must ever remain a subject of interest alike to the historian and the divine, and the author's treatment is not unworthy of it. If he lacks, as is natural, the brilliancy of Gibbon, his estimate is free from the cynicism and religious or irreligious partisanship which too often colour the views of that great writer. He has evidently taken pains to master his subject in all its bearings, and to do justice to the character and motives of Julian, without forgetting the singular infatuation under which he laboured, and how terrible a disaster to the best interests of mankind the success of his enterprise would have proved, had success indeed been possible. The result is a carefully drawn and fairly exhaustive sketch of all the main points in the character and course of that remarkable man. From whichever side it is looked at, there is a deeply tragical pathos about Julian's wasted life—there is so much in the man personally that claims our sympathy, so little in his cherished aims and convictions that can rouse any other feelings than aversion or contempt. As his biographer puts it with epigrammatic terseness, Julian was as nearly as might be the *vir sapiens*, while his cause was Antichrist. And hence he has been the object at once of rapturous panegyric and fierce abuse. Cardinal Newman states the case with his wonted felicity when he says that "the apostate from Christian truth, the foe of Christian education, in whom every Catholic sees the shadow of the future Antichrist, was all but the pattern man of philosophical virtue," in whom "we recognize a specious beauty and nobleness of moral deportment which combines in it the rude greatness of Fabricius or Regulus with the accomplishments of Pliny or Antoninus." From the first his enterprise was hopeless. As Chateaubriand says, "he turned his face to the past, and his back upon the future." And he seems all along to have been haunted and gradually embittered by a sense of failure which he would not admit even to himself, an uneasy consciousness that his best energies were being exhausted in the vain endeavour to twist ropes of sand. It is not simply that he was seeking to galvanize a corpse; he was, in Scriptural language, forcing new wine into old bottles which could not hold it. The idealized Paganism which he aspired to restore had never had any real existence, and it was worse than idle to attempt to breathe Christian sentiment into Pagan forms, which had long since lost their proper meaning and had never meant what he wished to make them mean. The wonderful thing is that a man of his acuteness should have supposed Paganism—and the bastard Paganism of the later empire—capable of reform; but he honestly did suppose it. He thought to create "a Pagan Church Catholic," as Comte in our own day has drawn the lines of an atheistic Church Catholic; he imagined that by a skilful plagiarism of alien forces he could engraft on "Hellenism" a purified morality and an organized Church. With this view he constructed an elaborate sacerdotal system, which was after all but a mere caricature of the Christian priesthood. But Pagan priests and philosophers sneered or laughed in their sleeve at a moral enthusiasm which they both hated and despised:—

The Paganism of Julian's time was incurably corrupt. It was immoral to the core. Many sanctuaries existed as dens of debauchery. Prostitutes were priestesses, and temple was cant name for brothel. The essence of worship was the satisfaction of lust. When on days of high festival Julian royally attired passed through the streets of Constantinople to solemn celebration of the feast, it was no decorous procession of venerable priests or modest virgins that followed in his steps: around the chaste grave young Emperor thronged a drunken rout: among those that bore the insignia of sacerdotal pomp were mutilated priests of Cybele, priestess-courtesans of Venus, immodest screaming bacchants catching the public gaze by their obscene cries and antics. And this immorality was not only on the surface, or confined to certain public resorts. It was far more than skin-deep. It pervaded and poisoned the very springs of home life: it violated the sanctity of the domestic hearth.

Julian, like Marcus Aurelius and some of the best of the Emperors who preceded him, seems to have anticipated in the advance of Christianity a danger to the Empire, but it cannot truly be said that the root of his antagonism to it was political. Unlike Marcus Aurelius, he had a genuine belief in the Pagan mythology, though it is not easy to reconcile the monotheistic language he constantly employs in his intercourse with philosophical friends with his open

* *The Emperor Julian, Paganism, and Christianity, being the Hulsean Essay for the Year* 1876. By G. H. Rendall, M.A., Fellow of Trinity College. Cambridge: Deighton, Bell, & Co. 1879.

and zealous adoption of the popular polytheism. He saw visions and dreamt dreams, and believed himself to be in habitual, almost daily, intercourse with the deities he so sedulously worshipped. It must always be remembered that Julian differed from all his Pagan predecessors in the fact of having been baptized and brought up to the age of twenty in the profession of the Christian faith, though it was probably in his case never more than a profession, and then having deliberately renounced it. This peculiarity of his circumstances inevitably and very materially affected his attitude of mind towards both the creed of his birth and that of his adoption. The zeal of converts is proverbial; it has not been so generally observed that they often contribute to the system they embrace more than they derive from it. This was at all events conspicuously the case with Julian. The tone of his personal religion is undeniably lofty, but it is also undeniably, and almost confessedly, Christian. If the shortcomings of Christians—and imperial patronage had already done something to secularize the temper of the Church—paved the way for the Pagan reaction, Christian morality determined the shape given to that reaction in the hands of Julian. But his indebtedness to the creed he had scornfully abjured, which was too obvious to be altogether disclaimed, only intensified his hatred of it—*incredulus odit.* His paradoxical faith in the recuperative power of Paganism was only less surprising than his entire miscalculation of the power of its great rival. So far from perceiving—what had already become manifest to friend and foe alike—that the future lay with Christianity, he entertained for it a mingled feeling of aversion and contempt. Something may be due, as Mr. Rendall suggests, to his having received his Christian teaching "in the mangled and imperfect form of Arianism," but he was also singularly unfortunate in his early experiences of leading men among the Christians—notably in the Emperor Constantius, his uncle and the murderer of his father, and the Arian courtier-bishop Eusebius, who was his tutor. This helps to explain how throughout life he persistently identified the character of the religion itself with that of the least worthy of its representatives. Both the rival systems were idealized in his mind, but the Pagan or, as he preferred to phrase it, "Hellenic" idea was a creation of his own to which nothing corresponded in the outer world of fact, while his Christian ideal was a hasty and perverse generalization from some of the lowest types of a corrupt Christianity, on whom he had chosen to fix his exclusive attention as characteristic specimens of the "Galilean" sect. Of the nobler spirits in the Church of his own day he knew or cared to know nothing. Basil and Gregory Nazianzen had been his fellow students, but of them he takes no cognizance; the mountebank Aetius was his favourite among Christian bishops, while he scarcely ever names Athanasius, whom he did not know personally, except in terms of vulgar abuse. And his estimate of the men shaped his moral and intellectual estimate of their faith. He confounded the irregularities and accidental blemishes on the surface of the system with its vital principle:—

Julian's primary misconception of Christianity was in regarding it as a sheer contrivance, a kind of mutual benefit society set up solely in the interests of the managers. He had found so much hypocrisy among Christians that he assumed it of them all. S. John's attribution of divinity to Christ was a clever fraud: the whole fabric of sacerdotalism was so much ingenious mechanism: the clergy were ambitious schemers; if deprived of the power to tyrannise and dictate and appropriate other men's goods, they at once became centres of faction, professional incendiaries, whose work it was to inflame party against party in their own selfish interests. The monks—except indeed in those cases where they had been driven by devils into the wilderness and provided with manacles and collars—were no better; their assumed self-renunciation was a sham. . . . . . . To him almsgiving and charities were but ingenious devices to support the ascendancy of a ruling caste. He compares the Christians to kidnappers, who tempt children by mouthfuls of cake, and finally catch them and fling them into confinement, to spend a life of misery as the cost of the transient sweet that tickled their palate for the nonce. If Pagans did but imitate the cunning of the Christians on more magnanimous motives they would soon occupy the same position of influence.

Mr. Rendall devotes the longest chapter in his book to examining the charge of persecution constantly brought against Julian by Christian writers, and he answers it in a sense very favourable—we are disposed to think somewhat too favourable—to the Emperor. It is true that there are very few acts of direct official persecution on record, and that Julian, as became a philosopher, professed the principle of toleration. But in the very letter where he most expressly disclaims any desire for the killing or maltreatment of "Galileans," he at once proceeds to insist that "godly men (θεοσεβεῖς), that is Pagans, ought to be and are to be encouraged," and the encouragement might of course take various forms. As Gregory of Nazianzus puts it, "he issued indeed no public ordinance (of persecution) but non-repression of excesses converted his wishes into unwritten law." Julian was not content with showering his favours on those Christians who, in Gibbon's language, "prudently embraced the religion of their sovereign." He condoned or even commanded in several instances violent, if not always unprovoked, outrages on Christians. Thus, when at Ascalon the Pagan mob made a brutal attack on Christian priests and virgins and worried some of them to death, the Emperor was so far from blaming them that he actually deposed the governor of the district for his previous leniency towards Christians, and for exceeding his rights in putting some of the ringleaders in the outrage under arrest. Moreover any estimate we may form in favour of Julian's tolerance must be accepted with two important reservations. Mr. Rendall himself observes that there is no passage in his extant works counselling or legalizing persecution, "the education edict excepted"; and the exception is a serious one. The famous rescript, issued apparently towards the close of the year 362, directly forbade Christian professors teaching the classics, on a pretext studiously insulting as well as hypocritical, and thereby, as its author was perfectly aware, indirectly debarred Christian youth from studying such literature at all. Both in its intention and operation the edict was, as Mr. Rendall frankly admits, an act of "genuine persecution"; its deliberate purpose was to exclude Christians, as such, from the higher mental culture of the age, and, for the brief period that it continued in force, such was the actual result. The probable date of this edict, which followed two others conceived in a similar spirit but far less explicit and direct, and which appeared only a few months before the Emperor's death, suggests another reflection to which Mr. Rendall seems hardly to have attached its due weight. The entire period of Julian's reign as sole Emperor is comprised in just a year and a half, from December 361 to June 363, and he died in his thirty-second year. There was not therefore much time for any persecuting tendencies to develop themselves. If it be true—and we have seen that even this must be taken with considerable reserve—that in his practice of toleration "he went as far as abstract justice seemed to demand, but not a step further," it is difficult to believe that a motive so comparatively feeble in most minds as the sense of abstract justice would have long held its ground against the force of religious prejudice and passion, embittered by a growing consciousness of failure, as well from "the irresponsive sloth" and frivolity of the Paganism he desired to renovate as from the steadfast resistance of Christians to all the arts of persuasion he could bring to bear on them. The tone and substance of his educational rescript is by no means a solitary example of this growing bitterness of sentiment, which showed itself not only in word but in an increased disinclination to curb the excesses of imperial officers or mobs against the Christians. We may receive with discredit or distrust the assertions of contemporary writers of his threats to proclaim war to the knife against the Church after his return from the Persian war, in which he perished; but we can hardly doubt that, had his reign been prolonged, he would have gradually but surely drifted into a policy of systematic persecution. Gibbon, who on the whole is his warm panegyrist, remarks that in compiling his elaborate work against Christianity amidst his preparations for the Persian campaign, Julian "imbibed the illiberal prejudices and passions of a polemical divine," and "contracted an irrevocable obligation to maintain and propagate his religious opinions." To the same closing period of his life belongs the strange attempt, so signally defeated—which Mr. Rendall passes over in silence—to rebuild the Jewish temple; and this, as Gibbon again points out, was obviously undertaken with a secret design of discrediting the Gospel. That desire would inevitably have gained upon him with the irritation of continued ill-success, for his dying exclamation *Vicisti Galilæe*, if he really uttered it—Mr. Rendall considers it apocryphal, but does not give his reasons—was a despairing cry of failure, not a confession of faith.

Nevertheless the reign of Julian materially benefited the cause which he was so eager to destroy. It acted on the worldly and corrupt Christianity of the fourth century, somewhat as the French Revolution acted on the Christianity of the eighteenth, "as an invaluable purge or disinfectant." Little as he did to deserve her affection, the Church in one sense owes him a debt of gratitude. Mr. Rendall explains this very happily in a characteristic passage with which our notice of his able and interesting volume must conclude. For the details of the history we gladly refer our readers to the work itself, with the assurance that a careful study of the contents will fully repay them:—

Julian's reign not only sobered factions, and developed reconciliation: it also separated the worldly and the hypocrite from the true man and the believer, sorting and sifting out a purified residue. It proved that though overlaid with error, and stifled by foul excrescences, and charged with heavy vapours, the vital forces of Christianity were potent still. And one other service it partly did. Premature recognition by the State had damagingly paganised Christianity. In art, in ritual, and in politics the Church showed traces of too facile accommodation to heathen modes of thought. Men were abruptly reminded that the distinctions between heathenism or Hellenism and Christianity were something more than verbal differences. Even at the cost of some irritation of susceptibilities, and some narrowing of sympathies, it was a lesson most needful to learn. Julian had not lived in vain.

A COUNTRY PASTOR'S EXPERIENCE OF WAR.*

A CLERGYMAN who has spent his life amongst his people in a quiet village, and who finds his parish suddenly made the scene of a tremendous conflict between two mighty military Powers, may be well qualified to exhibit in their true light the horrors of warfare, but is less likely to form a sound judgment as to the merits of the quarrel or the strategy of the generals on either side. In one sense, the tempest of war never perhaps burst more unexpectedly on the inhabitants of an insignificant hamlet than the Franco-German war broke on the Pastor Klein and his parishioners of Froschweiler. But there were many circumstances both in his own position and in the causes of that terrible struggle which qualified him to form an independent opinion, and impart a special interest to his recollections of the scenes which he was compelled to witness. To a large extent pictures of war must resemble each other. The effects of all wars must, for many or

* *The Pastor's Narrative; or, Before and After the Battle of Wörth, 1870.* By Pastor Klein. Translated by Mrs. F. E. Marshall. London: Longmans. 1879.

most of those who are drawn within their horrid circle, be the infliction of misery unspeakable; and no true leader of men will quarrel with the saying that the bringing about of an unnecessary war is the greatest of crimes. So far, then, as the Pastor's reminiscences of such sufferings are concerned, we need only say of them that they are here recounted with a vividness which is in no way weakened by the simplicity of his style, and that in its own kind few narratives can be named which are more striking, more impressive, and more touching. When we remember that the horrors which are here related were repeated on even a more stupendous scale at Rezonville, at Gravelotte, at Sedan, not to speak of many another hard-fought field and siege, we might suppose that the world must have learnt a lesson which it cannot speedily forget.

In Elsass, as perhaps elsewhere, the plebiscite demanded by the Emperor in the spring of 1870 carried with it for the people forebodings of strife. The village politicians were not far wrong in thinking that the Emperor was walking backwards, or else they would not have to decide whether he was to stay or not; but they were mistaken in telling their fellows that, if they voted for him, they would pay the penalty in a war. If the plebiscite had anything to do with the events which followed it, the cause lay in the negative votes, a large proportion of which came from the army; and these signs of military discontent may have weakened the resolution of the Emperor, who was well aware that for him, if not for his country, war must be ruin. He may not have known precisely how far the mischief had gone, and, like embarrassed traders, he may have thought, or have tried to think, that his fortune might carry him through one more venture; but the world has since seen the reports which were then lying in his desk, and which, by a masterly comparison of the conditions of the French and German armies, proved to demonstration that any idea of provoking a quarrel with the German nation must be nothing less than absolute madness. In Elsass the declaration of war seems simply to have astonished the people. Of enthusiasm there was, strictly speaking, not a sign. There was much talk of the triumphant procession of French armies to Berlin; but there was a much more frequent expression of fear that, before these could set foot on German soil, the Germans would strike a blow within the territory of the aggressor. In a certain sense the people were all united; but it was a union of people of whom one part regarded France as their country and felt a bitter hatred for the Germans, while the other looked upon it as a land with which they were in close alliance, but made no secret of their "heartfelt sympathy for opponents so united to them by ties of religion and blood." "Both," the Pastor adds, "were determined to do their duty, even at the cost of life and property—the one with wild fanaticism, the other in dependence on the Disposer of events." For the former, in other words, the justice of the quarrel was a matter of indifference; for the latter, it was a subject on which, to say the least, they would be thankful to have more conclusive evidence. Neither, however, had the least notion that the first scene in the great tragedy would be played out among themselves. For the time the declaration of the Emperor Napoleon, that a great people defending a just cause is unconquerable, deceived some or many of them into thinking that the words applied to the Emperor's armies; and when the first soldiers made their appearance on the 22nd of July, the Alsatians were delighted at the idea of entertaining guests of whom they thought only as birds of passage. The troops had brought no stores with them; but for a small party sent simply as scouts this was not surprising. The best that the village could afford was brought out, not merely ungrudgingly, but joyfully; and the same unstinted welcome was extended to the companies of chasseurs who followed them. The Froschweilers were soon richly blessed, as the Pastor expresses it, with the soldiers whom they had so longed for. Their numbers in three or four days exceeded six thousand; and then the true state of things broke upon them in all its startling reality. The men were there; but there was, it seemed, absolutely no provision for their maintenance. Even for this large number the countryfolk had furnished food without murmuring; but, he adds, and well he may add:—

Having done this, we were of opinion that the Emperor and nation, for whom our sons and brothers were going to death, were bound to nourish them; and we believed in our simplicity that behind each newly arrived regiment had come waggons with bread, meat, wine, &c.; so thought also the good fellows themselves, and the first day they were merry enough, slept comfortably in their tents, and trusted to the morrow. The morrow came, the little ovens were already prepared, and the tin saucepans stood ready to cook the expected soup; but no waggons appeared, and the lighting of the fire and the cooking of the food had to be put off this time. Well, no matter for once.

But it was not to be for once only. The day passed, and the night was closing in, when officers and men with money in their hand begged the people to sell them such food as they might have. The latter refused to sell, but insisted on their taking it as a gift. The time was at hand when officers and men alike would demand it without payment, and would steal even that which the people were keeping to meet their own direct need. We cannot doubt that the Pastor is strictly within the bounds of truth when he says that in all the terrible confusion which followed "there was not a single man who knew anything, who could give an order, or who could point to a way out of the difficulty." French soldiers are not very slow in arriving at decisive, and perhaps somewhat unjust, conclusions. "We are betrayed," they said; "they mean to leave us here. We will go over to the enemy." Officers assailed by the hungry multitudes cried like children as they confessed that they had nothing, and could give nothing. On the eve of the battle of Wörth 33,000 rations were brought into the camp; but many more were needed, and the cans of meat and soup which were found full after the battle proved that for many the food came too late. Those who should have had it went into the battle "to fight and bleed for the fatherland the whole day through without food or drink; one can only marvel that they withstood the fearful onslaught of the enemy as they did. All honour to them for having done so; it remains as an example of heroic faithfulness."

It might be easy, and perhaps also not very profitable, to analyse the feelings by which these unfortunate men were moved under circumstances so frightful. A sentiment of patriotism probably combined itself with the instinct of self-defence, and banished the thoughts which in the absence of personal danger would resume their sway; for the fact cannot be disguised that the armies of the Second Empire were utterly undisciplined. They presented, in Pastor Klein's words, "a terrible picture of moral and physical starvation." Unable for the most part to read or write, they looked upon themselves as mere food for powder. Without military spirit, without even the soldier's feeling of honour, they passed their time "like lazy homeless beggars." The private treated with contempt the orders of the corporal; the corporal avenged himself by disregarding those of the sergeant; by the sergeant the insult was retorted on the lieutenant; and so things went on in an ascending scale, until the highest pitch of insubordination was reached. The following is an instance:—

It so happened that our good captain trod upon the foot of a common soldier. "Who told you you might tread on my foot? I won't have my foot trodden upon!" was the insolent speech. The captain was silent, though he bit his lip to conceal his anger; and when I said to him, "Why do you not have this fellow instantly locked up?" he replied, "I dare not; why, he would put a bullet through my head to morrow!" "Is it possible?" "Yes, indeed, it is."

On the next day General Abel Douay fell at Weissemburg; the report got abroad that he fell by a French shot, and few expressed any surprise. But the Pastor is careful to acquit both officers and soldiers of the guilt of this terrible failure of discipline:—

The French soldier is not in the main more irreligious or immoral than any other; and how can he help religion having been made a comedy or a fetish worship, and corruption having spread downwards through all classes? Was it his fault if the many foreign wars of the Empire had turned the army into a mob of pretorians, lusting for glory and pleasure; if the continual licentious camp life had undermined discipline and morality; if the last declaration of war had gone counter to all justice; if the careless equipment and provisioning of the troops brought about the most frightful license? The French soldier, as he was in 1870, was the miserable product of his great Fatherland; and the humiliation of August 6, and the historical failure of the whole campaign, are not to be put to his reckoning, but to those who at this very day are leading the richly-gifted French people to the brink of the precipice.

Herr Klein is perhaps thinking of the dreams in which some Frenchmen profess to indulge themselves—dreams which are to reverse the catastrophe of Sedan and to scatter Germany once more into the fragments which have been painfully and laboriously brought together since the tyranny of the first Napoleon. Persistence in those dreams, if they are still cherished, may plunge France into an abyss from which she may never again emerge; but possibly the Pastor's judgment may be influenced by a growing appreciation of the country which, from sundry phrases, it is clear that he regards as a fatherland whose ancient claim on his allegiance has been revived by the events of the last nine years. It is not merely from the marked and indeed the astounding contrast between the completeness of the German commissariat system and the fatal breakdown of the French, although this must count for much. Neglect of the soldier is simple inhumanity, if this neglect is shown before he goes into action; it is so in a vastly higher degree when he is writhing in anguish from wounds received in battle. The hospital arrangements of the French were as wretched as those of their commissariat, and the impartiality with which the German surgeons tended friend and foe alike made clearly a very deep impression. But, more than this, it seems that the men of Elsass had not quite forgotten the days of the Grand Monarque, and they were apt to call to mind the fact that before his time their forefathers had not been Frenchmen. As the fields of Froschweiler became crowded with troops who had nothing to eat, a good deal of quarrelling was a natural consequence; and the Pastor adds significantly that the German peasants "lost their enthusiasm for the Fatherland pretty quickly and their patience too. They pursued the soldiers through fields, gardens, and cellars; they tried to defend themselves—they scolded, complained, and loudly called upon the Prussians to come to their help." When these dreaded Prussians came, the Elsass folk besought their pity, saying, "We are Germans too; we are good Christians"; and were told that they should suffer no harm, and that their conquerors were sorry enough to have to burn and destroy. When at length the awful fight at Wörth was over, and the German hymns of thanksgiving for victory rose into the night air, the impression made on the Pastor and his people was deeper still.

How solemnly and strangely they fall on our ears, borne along the midnight air! Sounds of unspeakable woe to us, but bringing a holy calm to our hearts. They draw our terrified spirits unconsciously towards heaven—they are *our* songs. They are echoes of home from days gone by—songs of thanksgiving and victory sung long ago by our German ancestors, and are dear to our hearts to this day. Has God, the shaper of the world's destiny, some great work for our Alsatians to do? Will He lead us, with all the

pain of parting, back to the mother country? Oh, what a long and painful struggle will that cause! It is the Lord! let Him do what seemeth Him good.

While the battle raged round Froschweiler the church caught fire. It was full of wounded; but, even with this urgent need, the Germans could not stop to give help. "Let it burn," they said; "we will build it up again." The wounded were got out somehow; and the Germans kept their word. A stately memorial church rose on the site of the humble structure which had been associated with the ideas of French dominion; the whole, in fact, might be regarded as a gift from the old country. It is not surprising that, under such conditions, the process of reconciliation should go on somewhat rapidly. It may be regarded as practically complete if we may take in their grammatical sense the words with which a deputation greeted the German Emperor when, three years ago, he visited the lands which had once more become German. They had come, the address said, with enthusiasm to greet in his person the prince to whom they bow as their rightful Head under God, and they relied on his guarding the inheritance of their fathers, and on his bringing up their people in the true love of God and man and in faithfulness to their Fatherland. If this reconciliation be permanent, the Second French Empire will have done some good; and it is pleasanter to carry our thoughts on to this brighter future than to let them dwell on the great catastrophe which may well fill all who read the awful tale with utter hatred of the Napoleonic idea. In stirring up this feeling the Pastor Klein's book must be eminently successful.

YOUNG MRS. JARDINE.*

We know few novelists who can vie with the author of *John Halifax* in spinning slight materials into long stories, and, to do her justice, her gossamer webs are generally of delicate workmanship. Yet, on second thoughts, "web" is a most inappropriate metaphor, since, so far from the scheme of her novels being intricate, there is seldom even the semblance of a plot. All depends upon the treatment of characters which neither demand nor receive subtle analysis; on the faithful delineation of very ordinary feelings; and on the awakening our sympathies with some half-dozen of our fellow-creatures who have almost invariably the merit of being natural. One is sure of having the emotions stirred sooner or later by some moving scene of family trouble, and a certain mild attention is awakened in the course of existences that are far from eventful. We can understand that the author should find steady admirers among novel-readers who profess temperance principles so far as the rougher and more heady sensations are concerned. For ourselves, we confess to being sometimes inclined, in reading her books, to long for a startling catastrophe or the shadow of a sombre mystery, though we have no great liking for the melodramatic in general. We would welcome something to fillip the languid interest, which, though it may be agreeable enough for a certain time, begins to die down while the story is stagnating. In novels that dispense with incident very much depends on how each separate set of volumes happens to strike one. In *Dorcas*, the last work by the author, the tone throughout was quietly harmonious. The mother and daughter who figured successively as heroines lent themselves naturally to the feminine treatment in which the author excels. Even the gentleman who married the older lady, and became the father of the younger, was a lady, or at least a lady's man, in every essential respect. Could he have so far overcome his constitutional indolence, he might have come forward as honorary president of a Dorcas Club, and assisted at the distribution of garments to the deserving poor. In *Young Mrs. Jardine*, the author has selected a somewhat different type of hero, and has scarcely succeeded so well. Roderick Jardine is forced by circumstances into a hard and uphill struggle for existence; and has to do battle with the world which has hitherto petted him, just as he has weighted himself with a foreign wife. His conduct is that of a man and of a brave man. He resolutely accepts a very humble position, that he may provide the necessaries of life for the woman he adores; and he has the appearance of carrying his head high in the society whose prejudices he has outraged by his choice of an occupation. Yet Roderick, though apparently meant to be represented as an embodiment of spirited manhood, has to the eye of a man much of the woman in him. It is not merely that he is impulsive, morbidly sensitive, and romantic; for these are failings or qualities that are common to the youth of both sexes. But he shows some lack of the self-reliant pluck which "is the only thing that will wash," to borrow a phrase from one of the Rugby boys in *Tom Brown's Schooldays*. It is his noble-minded wife who inspires him, directly or indirectly, in the acts of courage or endurance where his nature more honourably asserts himself. The author may perhaps urge that that conception of their relations was a part of her plan; that it was her idea to exalt the ennobling influence of a noble woman on the husband who has the grand virtue of devotion to his wife. So it may have been to a certain extent; yet there are many little touches that tend to confirm us in our depreciatory opinion of Roderick. And he is too evidently painted as a woman's ideal of what a good and meritorious young man should be. "He had no young men's small vices; he thought billiards dull, and detested smoking." Setting smoking down so uncompromisingly as vicious reminds us of De Quincey's catalogue of crimes, where, by beginning with such peccadilloes as murder, you may be landed at last in such atrocities as evil company and procrastination. Then Roderick's extraction, antecedents, and upbringing were anything rather than heroic, and this necessarily raises difficulties in the way of making him romantic or even interesting. Like most Scotchmen, he has a pedigree, and he never forgets that he is a Jardine. But his father had married the daughter of a blacksmith, who had enriched himself by hard-headed industry; and Roderick, though in his inbred refinement he is represented as having little in common with his mother, has unconsciously inherited some of her vulgarities. He has been nursed from his childhood in the lap of luxury; but it was the ostentatious luxury of *parvenus* who paraded it on state occasions, and he could hardly have hoped to escape some taint of the contagion. His native town of Richerden was a thriving second-class Scotch manufacturing borough, and Roderick, with his airs of provincial fashion, is one of a class whom gentlemen are apt to hold in horror. His taste for diamond shirt studs as a symbol of caste clung to him even in the days of his adversity.

But in Roderick's case the old proverb holds good; and, if he proves for a time unlucky in other things, he is exceptionally fortunate in love. The young Swiss girl of Scotch descent whom he marries is all that is most desirable in woman, nor do we remember among the many fascinating girls the author has drawn any one who is at once more striking and more engaging. Perhaps Silence Jardine—she is a second cousin of Roderick's—is a little too resolutely though calmly determined to suit the taste of many men. But her firmness supplements the deficiencies of her husband, and no woman is absolutely perfect. If Roderick is something less than a gentleman, there can be no question as to Silence being a lady, though she has been brought up in penury and the simplest habits. It is in Switzerland that Roderick makes her acquaintance, bewitched by her voice and eyes, and falling passionately in love at first sight. He had gone thither believing himself rich, and with a very generous purpose. That is no other than the transference of a small inheritance which he might have kept to himself to the unknown Swiss relations on whom he immediately stumbles. The agreeable but unassuming Swiss society in which Silence is loved and admired, though she has to help her mother by giving lessons as a daily governess, is evidently depicted from familiar acquaintance and with the gratitude of affectionate remembrance. And we have raptures over the snowy range of the Oberland as seen from a variety of points of view between Neufchâtel and Berne which recall to us Mr. Black's enthusiasm while dilating on the glories of the Western Hebrides. By the way, we recognize our old friend the Finsteraarhorn figuring under the odd pseudonym of the Fensterhorn; nor can we say that we think the new etymology an improvement, since there seems to be more poetry in the Dark Peak than in the Peak of the Window. But Roderick ceases to have eyes for the mountains, except when he looks at them through Silence's eyes. In Silence there is a most engaging blending of discretion and wisdom, simplicity and sound sense. She is slow in answering to her Scotch cousin's ardent advances, but when once she has given him her affections they are bestowed without reserve. She lets Roderick know that she can only love him with all her heart because she respects him from the bottom of her soul. And the most chivalrous side of his character is brought out under the circumstances. She is not aware that the little property he has brought her comes more as a gift than as a right. But she can appreciate all the delicacy of his conduct when the sudden death of her mother leaves her orphaned and isolated. She does know that he marries her against the wishes of his family; he has assured her that his happiness is bound up in her, and she believes it; she has solemnly given him her promise, and he has a right to dispose of her as he will. But she does not know or realize the greatness of the sacrifice involved in his marriage. The wealth of the Jardine family is vested in his mother. She resents her son's throwing himself away, and renounces him. His sisters, who are leaders of fashion in Richerden, follow suit, and he is generally cold-shouldered by his vulgar acquaintances. The young couple have come to settle in Scotland, where Silence is slowly forced to realize the misfortunes the match has brought on her husband. Grieved as she is, she says very little; her husband is pledged to her as she is bound to him. But she sets herself quietly to compensate him so far as she can; and she more than succeeds in making him never regret having chosen her. She relieves him of more than half the burden of his sorrows, while bearing her own anxieties in patient silence. "Young Mrs. Jardine" has a sharp struggle to sustain; though, happily, so far as their material wants go, she has been used, as a girl, to frugal housekeeping. It is far more difficult to persuade her husband to carry himself with composure and dignity in what he considers a false position. For herself she has no false shame, and sees no reason why he should give up society altogether simply because their poverty is notorious. It must be owned that Mr. Jardine has a difficult game to play, according to our conventional notions. For, having been disappointed in an attempt to break ground as a novelist, he has courageously fallen back upon manual labour, and accepted the post of foreman in the works of a rough, but kindly, manufacturer of machinery. Yet, chiefly for the sake of his sweet young wife, he is still invited into county society as the representative of the old family of the Jardines, and there is a certain awkwardness in an artisan from the neighbouring works mixing on a footing of easy equality with the guests of the great house.

* *Young Mrs. Jardine.* By the Author of "John Halifax, Gentleman," &c. London: Hurst & Blackett. 1879.

whose servants might consider themselves his superiors. It is Silence who is invariably equal to the occasion; whose simplicity of breeding is never at fault, and whose graceful unconsciousness makes her husband forget himself. Growing to value her more and more every day, seeing the regard in which she is held by other people, no wonder that he is cast down to the depths of despair when she is given over by the doctors in her first confinement. Even in the prospect of an imminent separation, she remains his good angel. If she must be lost to him, at least she will leave him, if she can, the legacy of the recovered affection of his mother. The most impressive episode in the book is the scene of reconciliation; when the worthy, but quick-tempered and unforgiving, old woman comes to announce to her son by way of peace-offering the safety of the wife who had caused the breach between them. And he has to thank his mother for more than that mere announcement; for it is her matronly skill and tender nursing that came to the aid of nature in its last rally.

The happiness resulting from Roderick's love-match is thrown out into bolder and brighter relief by contrast with a miserable marriage for money, made by the sister who used to be the playfellow of his youth. So the book seems intended to convey a moral which might perhaps be dangerous in its general application; for a Silence Jardine falls to the lot of few, as there are not many living novelists who could have drawn her with the firmness and delicacy of the practised author of *John Halifax*.

AMATEUR THEATRICALS.*

THIS bright and serviceable little volume makes a welcome appearance at this season of the year. The dark-eyed maiden, Comedy, as Miss Kate Greenaway portrays her in a charming frontispiece, is now plucking up heart in a hundred private greenrooms, and wondering whether she will really have the courage to flirt her fan with becoming archness before the terrible footlights. The present generation undoubtedly pays more attention than the last did to the graceful amenities of life, is less fussy and cantankerous, and more catholic in its tastes and tolerations. The authors of this little book sum up with impartiality the objections as well as the advantages of the diversion they recommend, and we recognize with amusement the good old-fashioned arguments of our childhood, that private acting may provoke a taste for the stage, or lead to personal vanity, or excite the brain unhealthily. Perhaps the best remedy for all these suggested evils is to be found in removing all sense of novelty or strangeness from the exercise. Young people who habitually see these representations prepared, and who perceive that the study they require is laborious and prolonged, will soon cease to be unduly elated or morbidly impressed by them, if they are themselves naturally of a sensible temperament. Against innate frivolity and foolishness of spirit the household gods must always contend in vain. On the other hand, it would be difficult to overrate the advantage of amateur theatricals as a school for the minor morals. Patience, serenity of temper, and obedience to discipline are inseparable from the system of good rehearsals; the habit of moving freely in imaginary situations before an audience is productive of self-respect and good manners; while the very process of obliging the mind to throw itself into the circumstances of another, though a non-existing, personage must enlarge the sympathies and improve the judgment.

We are happy to note that the authors of the volume before us have been very far from confining themselves to the merely bright and cheerful side of their subject. The art of amateur theatricals is one in which, more perhaps than in any other, a royal road to success is expected by those ignorant of its mysteries. To indolence, conceit, impatience, and the modern vice of disobedience to lawful authority are due more failures in private acting than to want of experience or of talent. The stage-manager seldom lies upon a bed of roses, and he is wise if, before selecting his cast with a view to histrionic gifts, he selects with a view to docility and temper. A single stiffnecked actor will be enough to destroy a play, and the etiquette of an amateur performance makes it extremely difficult to get rid of such a black sheep from the flock. Happy the manager who lights upon a play that all his company is pleased with; happier still is he whose actors are satisfied with their respective parts. If he has selected a comedy, he is fortunate if, at the third rehearsal, his principal actress does not refuse to appear except in drama; fortunate, too, if the young gentleman engaged to act the comic servant does not spread disaffection under the guise of the opinion of that oracle, his elder brother. It is plain that tact and discipline, in judicious combination, alone can ensure the good fortune of the piece. The manager must be a man of resource. He must know what to do if the hero will go hunting instead of attending rehearsals, if the second lady will whisper to her neighbour, if the despairing lover, like a cranky piece of machinery, will always hitch at the tenderest passage of his part. Hence it is not unlikely that the book before us will be found of more use to the manager, prompter, and stage-carpenter of private theatricals than to the actors themselves, since these last have little to do but to learn their parts exactly and to throw as much art and inspiration into their performance as they can—labours in which they can scarcely be assisted otherwise than orally. In this connexion we recommend to their careful study the second chapter before us, and especially those paragraphs in which the authors give a vivid sketch of the mode in which they have seen pupils instructed at the Conservatoire of Paris. M. Delaunay happened to be teaching on the occasion referred to, and we can hardly imagine anything more likely to give a novice a just idea of the peculiar combination of obedience with self-instruction which is so happily practised in that school than the careful reading of these pages. The amateur actor should, we think, particularly note the fact that M. Delaunay confined himself to the pointing out of the existence of an error, and left it to the imagination or the good sense of the pupil to discover at exactly what place the error had been committed. This strikes at the root of the great fault of most private, and unfortunately of many public, actors—the learning of parts by rote, with more or less effective elocution, but with no intellectual appreciation of the meaning.

There is one point in which we think that the authors would have helped their readers over a practical difficulty if they had stated their own views with more precision, and that is in the most difficult matter of selecting a play. We should have been grateful to them for a list of standard comedies, farces, and romantic dramas, especially of an older school, from among which amateurs might with advantage choose. Nothing is more melancholy than to cast an eye down the cramped alphabetical list of Cumberland's "British Acting Drama," as it displays itself on the covers of that well-known quaker series which is sent, "post free, to all parts of the world." Nine-tenths of these names mean nothing, even to an omnivorous play-reader, and not one in twenty of the pieces is suitable to private representation of any sort. We wish that the authors of *Amateur Theatricals* had nerved themselves to approach the burning question of Shakspeare on the private stage. Most probably they shake their practical and experienced heads at the very name, yet there is no doubt that to a great many private companies the pleasure of failing in Shakspeare is greater than that of succeeding in Mr. Tom Taylor. For these impulsive souls some guidance should have been provided, and it might have been with advantage pointed out that their ambition was more safely employed upon such fantastic and comparatively untheatrical pieces as the *Two Gentlemen of Verona* than upon *Hamlet* or the *Merchant of Venice*. We find it well said that

> The greatest mistake an amateur can make is to imitate the characteristics of any public performer, not only because direct imitation is a sterile thing, but because amateur dramatic art is different in its essence from professional art. The same sharp effects cannot be made, and should not be attempted.

These words might, with hardly any change, be adapted to the choice of a piece. Then, also, it is most unwise to attempt to reproduce a popular favourite, or to do lamely and imperfectly what professionals, with all the resources of their large establishments, are doing much better at the same time. Nothing is more poor and tiresome than the attempt to bring out in private theatricals a pale copy of the fashionable comedy or melodrama of the hour. The best that each actor can do in such cases is to imitate, as slavishly as possible, the pose, the elocution, and even the grimace of the well-known prototype. This bears the same relation to original modest acting that the chromolithograph of a famous picture bears to a delicate water-colour drawing taken from life.

While all is written with refinement and good sense, it is difficult to choose a single passage which will show the quality of the book without breaking the chain of thought. We have said much of the manager's share in the enterprise of acting, and we therefore select for quotation some very useful remarks directed to the actors themselves:—

> Amateurs cannot rehearse too often; the oftener they repeat and act their parts, the less nervous they will be at the performance, and the less liable they will be to put each other out; private theatricals are frequently made intolerable by imperfectly learned words. If a speech or part of a speech is forgotten, there is either an awkward pause, or the next speaker will go on with his part regardless of the nonsense it will make; then, having discovered that he has made a mistake, the unlucky actor is confused and nervous, and makes many more mistakes. The same thing is true as to entrances, exits, and positions on the stage; unless they have been rehearsed so often that there cannot possibly be an error, disastrous consequences may ensue. If the actor says, "Here she comes!" looking at the door where *she* does not come, the audience will naturally smile, although the author hopes for tears; and when, heated and flurried after a long wait, the lady appears at an opposite entrance, the smile grows into a laugh.
>
> It is impossible to insist upon a special mode of learning words. Every one has a different way of learning by heart; but it is well to make a strict rule to forbid the use of books after the first rehearsal, and it is better to trust to the prompter than to hold a book constantly in your hand, for the position of the body and the expression of the face are both lost if the book is held. It is also not wise to trust to the excitement on the night of the first performance as a stimulus to acting; for if it does so affect one performer as to suggest happy thoughts and new attitudes, the other actors will be thrown out of gear by these novelties. It is therefore desirable at all rehearsals to act as well as possible, and to make the last rehearsals run as smoothly as if they were played to an audience.

The closing chapter contains most sensible and practical advice respecting properties and scenery. Altogether we can only say that the volume is one which no manager of private theatricals can afford to be without if he wishes to secure the latest and most liberal ideas on the subject he has in hand. The book is well printed, though we notice that M. Frédérick Lemaître is misnamed Frédéric, and that the first line of Shirley's most famous song is given incorrectly. Four drawings by Miss Kate Greenaway, and six beautiful arabesques after Hans Sebald Beham, give distinction to the book, although they have not much to do with amateur theatricals.

* *Amateur Theatricals*. By Walter Herries Pollock and Lady Pollock. London: Macmillan & Co.

FRENCH LITERATURE.

THE Paris publishers appear to have chiefly occupied themselves with *livres de luxe* during the last month of 1879, and the new literature which has come under our notice is, with some exceptions, of less importance than usual. One of these exceptions is to be found in Dr. Robinet's *Le procès des Dantonistes* (1). The affection of the Comtist school for Danton, as compared with other prominent figures of the Revolution, is well enough known. Although the short and troubled career of the *sans-culotte* Mirabeau left it undecided what his future action might have been, the work which he actually did or inspired happens to be peculiarly congenial to the more rigid devotees of the Religion of Humanity. He did not compromise himself with an *Être Suprême*, like Robespierre; he was far removed from any sympathy with Monarchy, constitutional or unconstitutional; and the grandiose phrases which he and his followers loved, their quaint freaks of Republican Calendars and so forth, are all dear to the Comtist soul. Dr. Robinet has already busied himself with the defence of Danton's private character, and in this volume he takes up the question of the trial of Danton, Desmoulins, and the rest, with the object of showing that the conviction was unjust, the evidence garbled and unsound, and the charges of treason and corruption altogether unfounded. Many people, probably, who look at the Revolution with very different eyes from those with which Dr. Robinet contemplates it, will be quite prepared to admit, even without examination, that a trial in which Herman was President and Fouquier-Tinville Public Prosecutor was *à priori* likely to be unjust; though whether such a trial was morally more or less of a crime than the proceedings of the Septembriseurs, which Dr. Robinet (though he does not exactly defend them) attempts to palliate and to minimize, is a different question. The value of the book seems to us to consist not so much in its lengthy examination of the trial itself as in the preliminary observations. These, which fill a space of more than a hundred pages, contain a very clear and (making allowances for their author's point of view) a very acute summary of the various phases of the Revolution and the relation which prominent persons and parties from time to time bore to the whole movement. The object, of course, is to show that the decimation and intimidation of the Mountain frustrated the proper course of things, and led, first, to the mystical tyranny of Robespierre; then, to the corrupt rule of the Directory; and, lastly, to the usurpation of Bonaparte. But this object, though steadily kept in view, does not prevent the author from drawing his sketch with a firm and accurate hand. It is easy to make allowance for his prejudices, and then we have an *aperçu* of very considerable value left.

From Dr. Robinet's book we turn naturally enough to M. Poey's (2). M. Poey is an enthusiastic disciple of the orthodox school of Comtists; and this work is a desperate onslaught, full of italics and notes of exclamation, upon M. Littré and his evil ways. The summary of contents will sufficiently indicate to most people the character of the book, and this summary is not unamusing reading. But the text hardly carries out this promise, not to mention that the quarrel is one of singularly little interest to any but the faithful, though it is in itself a very pretty one. Meanwhile the assaulted person, in ignorance of his danger, brings out a short study (3) of two crises—the Punic wars and the palmy period of Arab literature and philosophy in Spain, in which the Semitic race challenged and was thrown by its rival the Aryan. The monograph (in which M. Littré frequently cites Mr. Bosworth Smith) is slight, but not uninteresting; and the same may be said of another monograph devoted to a portion of Semitic history, M. Joseph Simon's tractate on Jewish education (4).

M. Paul Thureau-Dangin has already produced some careful studies in the political history of France since the Revolution. His present work (5) has an excellent subject. The "Relations of Church and State under the July Monarchy" is a title which at once calls to memory the names of Lacordaire, Ravignan, Ozanam, and Montalembert, with an abundance of memories attached to each. The main question of the book is, of course, the long struggle between the Church and the University for the control of public education. The victory was not won till the July Monarchy had passed away; but the whole period of that Monarchy was occupied by the struggle. The real feature of interest in the matter is not so much the actual subject of battle as the remarkable revival of Catholicism which enabled such a battle to be fought at all. In 1830 and for a few years afterwards it seemed as though, in the large towns at any rate, the Church had more thoroughly lost political power than in the days of the Revolution itself. But by 1840 the contending parties were almost equal, and nothing but the disinclination of the statesmen who happened to be in power prevented the ecclesiastical party from attaining the advantages which have lately been once more imperilled. M. Thureau-Dangin writes from the Church side, but with great moderation, if not absolute impartiality. His position is naturally that of an advocate of liberty of teaching, and his argument for the Church is chiefly based on her indispensableness as a social agent. The very interesting question of the connexion between the success of the Catholic party at this time and the original and short-lived ideal of Liberal Catholicity to which, till the close of the period, they clung, is only skirted by the author; and that of the violent opposition raised in 1842 to Jesuitism is also not very thoroughly treated. But the book is well written, and likely to be useful.

To write a history of engraving (6) in a single volume is no easy task, even if that volume be a stately royal octavo. M. Georges Duplessis cannot, therefore, be fairly blamed if his work is in some respects little more than a summary. He seems to have gone for the most part to good sources of information, and to have done his best to arrange what information he could obtain; but we should imagine that his work was rather that of the bookmaker than of the specialist, and that his first-hand acquaintance with his subject was but limited. He proceeds by the method of locality, giving separate sketches of the history of engraving and the chief engravers in the different countries of Europe. It will perhaps be sufficient to say that in the section devoted to England we find no mention of Blake; that the only post-Hogarthian names noticed are those of Gillray, Rowlandson, and Cruikshank—spelt persistently Cruishank—and that the latter is said to be the *chef actuel* of English engraving, most of the younger artists drawing their inspiration from him. However, M. Duplessis's letterpress is probably intended chiefly as a companion to the admirable illustrations of which the book is full. These are for the most done by the Amand-Durand process, and, being printed upon excellent paper, they make the book a very desirable possession. They are selected indiscriminately from all, or almost all, the principal schools, and range from the Brussels Virgin of 1418 to very recent examples. The volume is concluded by a useful list of engravers with their dates and principal works. Here again, however, the intention is better than the execution, for under Hogarth the "Marriage à la mode," which the painter did not engrave himself, is mentioned, while the "Progresses" and other works, which he did engrave, are left out. It is certainly a pity that this production of a firm so admirable in point of the typographic merit of their books as that of Messrs. Hachette should not be more accurate in other points.

The same publishers have sent out two costly and elaborate volumes of reference, the one historical, the other geographical. The second volume of M. Duruy's *Histoire des Romains* (7) extends from the battle of Zama to the first Triumvirate. Being only a new and enlarged edition of a former work, M. Duruy's history does not of itself require much comment. From a literary point of view it is chiefly remarkable for its careful piecing together of passages from the authorities. But its accessories in this reissue are such as very few historical works can have had. Woodcuts, maps, and gorgeous chromolithographs have been lavished upon it, and the range of subject of the illustrations is of the widest. Coins, antiquities, portraits, landscapes, and reproductions of ancient art of all kinds decorate almost every page. Whether chromolithography is a suitable form of book illustration is a point upon which there may be several opinions, but there can be only one opinion as to the excellence in their kind of these particular chromolithographs.

The other volume to which we have referred is the fifth of M. Élisée Reclus's *Nouvelle géographie universelle* (8), which includes Denmark, Sweden and Norway, and European Russia. This great work combines the characteristics of an atlas, a gazetteer, and a commercial and ethnographical dictionary. The minute carefulness of its maps, which indicate even the depths of the sea in the principal waters, is quite beyond anything of a similar kind attempted in England, and if the large maps in colour had been somewhat more numerous, it would render the possession of an atlas entirely superfluous. This, however, is not quite the case, and only special points are selected for illustration in this fashion. The large separate maps are, however, supplemented by scores of smaller ones printed in the text, and supplying more than sufficient companions to that text itself. Views of places, buildings, &c., also form an important feature of the work, and the letterpress—if that somewhat derogatory term may be used—leaves little to desire.

The sixth volume (9) of the *Théâtre complet* of M. Alexandre Dumas, *fils*, contains *Monsieur Alphonse* and *L'Étrangère*, each with a new preface of the usual length, liveliness, and engaging absence of method or adherence to the subject. As that subject is generally the same (M. Dumas himself somewhere calls it a *matière inépuisable*) it is perhaps as well that his treatment of it should be desultory. It is fair to say that the beginning of the preface to *L'Étrangère* contains some really admirable criticism on the "Naturalist" school of drama. It is edifying as well as agreeable to see M. Dumas correcting the errors of M. Zola.

A new edition, after a considerable number of years, of M. Lucien Biart's book of sketches of the Tierra Caliente of Mexico has just appeared (10). Like others of M. Biart's books, it is a mixture

(1) *Le procès des Dantonistes.* Par le Dr. Robinet. Paris: Leroux.

(2) *M. Littré et Auguste Comte.* Par A. Poey. Paris: Germer Baillière.

(3) *Comment les Sémites entrèrent en compétition avec les Aryens.* Par É. Littré. Paris: Leroux.

(4) *L'éducation et l'instruction des enfants chez les anciens Juifs.* Par Joseph Simon. Leipzig: Schulze.

(5) *L'église et l'état sous la monarchie de Juillet.* Par Paul Thureau-Dangin. Paris: Plon.

(6) *Histoire de la gravure.* Par Georges Duplessis. Paris: Hachette.

(7) *Histoire des Romains.* Par V. Duruy. Nouvelle édition. Tome II. Paris: Hachette.

(8) *Nouvelle géographie universelle.* Par Élisée Reclus. Tome V. Paris: Hachette.

(9) *Théâtre complet d'Alexandre Dumas, fils.* Tome VI. Paris: Calmann Lévy.

(10) *La terre chaude.* Par Lucien Biart. Paris: Charpentier.

of travel and story, not very defensible in theory perhaps, but not destitute of attraction in practice.

The French press is generally busy now with small books intended for the young. The biographies of Kléber (11) and Bayard (12) included in the *Bibliothèque des écoles et des familles* are not very remarkable in point of literary execution; but are fairly done and most abundantly illustrated, the Bayard especially. M. Zaborowski's *Migrations des animaux et le pigeon voyageur* (13) has no great unity of subject, but contains some interesting details about the pigeons and balloons used in the siege of Paris.

Another department in which the pens of French writers are now very busy is that of translation. The *Bibliothèque orientale elzévirienne*, a collection of charmingly printed little volumes, sends us two new ones, the *Vikramorvaçi* (14) of Kalidasa, one of the less famous works of the author of *Sakountala*, and the Buddhist drama *Naganada* (15), both of which have before now been translated into English, though in a somewhat less accessible form. A companion series, the *Bibliothèque slave elzévirienne*, more lately begun, gives us Count Tolstoy's well-known drama, *The Death of Ivan the Terrible* (16). M. Jules Soury, an industrious writer on science and literature, has turned Haeckel's essays on cellular psychology into French (17); and, by no means from the same point of view, the lady who calls herself Elpis Melena has translated an anti-vivisectionist essay (18) of Ernst von Weber. Lastly, we must notice a handsome volume containing a French version of Prjevalsky's work on Mongolia (19), together with the English translator's preface, and Colonel Yule's introduction, also translated for the benefit of the French reader.

First among the fiction of the month we must mention a pretty reprint in M. Lemerre's *Petite Bibliothèque littéraire* of Gozlan's *Nouvelles* (20). For some reason which we shall not undertake to determine, Gozlan is by no means generally appreciated in England, despite the high place he deserves among the writers of French fiction during the reign of Louis Philippe. He is perhaps less individual than his more famous rivals, and his addiction to a certain vein of extravaganza and burlesque sometimes becomes tedious. But his power as a taleteller was very considerable, and is well represented in this volume. As a *conte excentrique*, *Echec à l'éléphant* has much merit, and *La main cachée*, despite its extravagance, is a very powerful tale of the pathetically horrible order. M. Claretie's remarkable romance of the slums of London (21) has, we see, already reached a second edition. The following of Eugène Sue in the choice of subjects and style of treatment, and of other writers of the time in the curiously inaccurate English local colour, rather injures the book to the English reader. Lord Harrisson and his son, Sir Charles Harrisson, and Miss Eva Perkins, are far too much of the race of Lord Boulingrog and of the remarkable person who seemed to the elder Dumas to be Edmund Kean. At the same time, M. Claretie really knows something of London, and has worked some quite recent facts and figures into his novel. The chief of the Metropolitan Police, at any rate, has no reason to complain of him, for M. Claretie declares that the appearance of Colonel Henderson is that of a "parfait gentleman." The same odd tendency to take English life for the subject of a novel without knowing much about that life, appears in *La servante* (22), and, curiously enough, both stories begin with scenes of wild-beast taming. M. Lafontaine, however, is hardly M. Claretie's equal in any way, and his story, besides being less out of the common, is far less entertaining. He seems to have read Dickens, and also Charlotte Brontë, the school to which the youthful Diane is introduced, and the circumstances of her introduction, being clearly borrowed from *Jane Eyre*. The book, too, is distinguished even among French stories of English life by its extraordinary nomenclature. The superscription *à womann* written upon a letter completely baffles us, unless it is intended for a free translation of *à madame*, and the names of Dixonn, Bood, Cokerett, and so forth, tell their own tale. As there is absolutely nothing in the plot or characters which would not have harmonized as well with a French as with an English scene, it is not clear what object M. Lafontaine had in choosing our country, unless it be to obtain a share of the favour which of late years seems to have been accorded to *romans anglais* in France. In contradistinction to these two books, the novels of Mme. Desyles (23) and M. Leroy (24) are purely French, and of a very bad type too. They have, in the first place, the unpardonable defect of being extremely dull, and in the second, the not less unpardonable defect of being pervaded by a hopelessly unreal and unhealthy sentiment and morality, though (save perhaps in the catastrophe of *Fabien*), there is nothing very outrageous in them. Mme. Desyles's book is a string of letters from a lady to her lover, very prosy, very common place, and at the same time very affected. It seems to have been written by some one who had read Mlle. de Lespinasse to Guibert, and Mérimée to his Inconnue, and who thought to combine the excellences of these masterpieces. *Ne fait pas ce tour qui veut.*

A more difficult book to class is *Zéphyrin Cazavan en Égypte* (25). It is one of the numerous works which the *Sentimental Journey* has inspired, the sentiment being changed into or accompanied by some odd scientific crazes. It naturally recalls the Egyptian portion of Gérard de Nerval's brilliant book, and as naturally suffers from the comparison, though the intention of the two works is sufficiently different. Although the desultoriness and jerkiness of the style and thought have too much of what is called in French *excentricité voulue*, they are not altogether destitute of charm, and the record of the author's Egyptian experiences and acquaintanceships, whether real or imagined, may be taken up for a few minutes with pleasure, and put down again without much regret.

M. Lemerre does not very often publish novels, and if nothing better offers itself to him than *On n'aime qu'une fois* (26), he does wisely in abstaining therefrom. M. Liesse is evidently an admirer and student of *L'éducation sentimentale*; and he has followed the plan of that singular book rather than of any other. The result is scarcely amusing, and certainly not instructive. It is, however, curious to find yet another book in which an episode of wild-beast taming with sanguinary results plays an important part. *La chasse à l'héritière* (27), on the other hand, is a harmless, and, on the whole, not uninteresting book, describing the snares set by fortune-hunters for a certain Miss Evelyn Benedett, granddaughter of a rich New-Yorker named Sir William Palmers—surely a very singular New-Yorker.

Lucie Rodey (28) demands a notice to itself, rather because of the reputation which its author has attained than because of its actual merit. It is brightly and intelligently written, and is free from the abominable *argot* which is creeping over all the lighter literature of France. But the plot and characters are neither novel nor powerfully handled, nor, we venture to think, wholesome. We have once more the old quartet of the worthy wife with an unworthy husband and the worthy husband with an unworthy wife, who "chop and change ribs *à la mode Germanorum*," at least as far as the immoral pair are concerned. The whole book is strongly tinged with a peculiar morality not dissimilar to that of which M. Octave Feuillet has hitherto been the fashionable exponent, and which is to some persons rather less pleasant than the absence of morality altogether. We do not say that the secret of Henri Gréville's popularity is entirely the same as that of the still greater popularity of her master, for she is in some respects an improvement upon him. But those respects are not literary, and especially they do not concern the construction of her plot and the means used to enlist personal sympathy with the characters. Lucie herself, though she might have been less absolutely stainless in M. Feuillet's hands than in those of his pupil, would have been a great deal more human. The good Georges Varin, again, is a terrible stick; and the manner in which he warns his wife as to her conduct is the most admirably chosen in the world to precipitate a catastrophe. The best figure in the book is Max Rodey, the erring husband, whose impulsiveness and total want of dignity are, if not exactly engaging, at any rate amusing. But the book, as a whole, by no means justifies the repute which, by virtue chiefly of a curious conjuncture of circumstances, Mme. Henri Gréville has gained both in France and abroad.

Some fictions of a less ambitious character remain to be noticed. M. Tnadlam's book (29) is half a novel and half a treatise on animal magnetism and the less dubious science of astronomy. The machinery of its plot would not recommend it in England as a vehicle of instruction; but it shows a certain liveliness of fancy. *Les deux reines* (30) is a pleasant little story of the good ugly girl and the pretty bad girl, the former of whom is rewarded finally with a beautiful Inspector of Finances, with large expectations. The two volumes of short stories (31, 32) from the *Bibliothèque des écoles et des familles* are extremely good of their kind, especially *Chacun son idée*. Some of the little tales in this volume are as good as they can be; and no better gift could be found for young people who are just beginning to read French with pleasure. *La nouvelle Atala* (33) is almost sufficiently explained by its title, and by the statement that it is the work of a Roman Catholic missionary among the Indians of the Mississippi district.

(11) *Vie de Kléber.* Par d'Aubigné. "Bibliothèque des écoles et des familles." Paris: Hachette.

(12) *Histoire de Bayart.* Par d'Aubigné. "Bibliothèque des écoles et des familles." Paris: Hachette.

SATURDAY REVIEW

OF

POLITICS, LITERATURE, SCIENCE, AND ART.

No. 1,263, Vol. 49. January 10, 1880. [Registered for Transmission abroad.] Price 6d.

MR. PARNELL IN AMERICA.

IF Mr. PARNELL's visit to the United States fails to do all the mischief which he contemplated, he may console himself with the reflection that the reign of anarchy for which he has laboured has already commenced in the West of Ireland. His exhortations to occupiers to defy the law by holding "a firm grip of the land" have already been followed in many places. His disciples have threatened and sometimes brutally assaulted peaceable tenants who were willing to pay their rent; and in many instances the prevailing intimidation serves as a pretext for resisting the just demands of the landlord. The most serious disturbance has occurred in the form of a conflict between a body of rioters and a strong force of police in Galway. There is reason to fear that, although the mob was ultimately dispersed, it succeeded in preventing the eviction of the contumacious occupiers. At numerous meetings inflammatory addresses are made by the agitators who represent Mr. PARNELL in his absence, and their consciences are probably in no degree troubled by the cruelty and suffering which result from their efforts. They cannot but be aware that, amongst other evils, they repel the sympathy which would be naturally felt for the inhabitants of distressed districts. In suggesting to their followers as a remedy for poverty audacious violation of the law, they convert objects of charity into criminals. The law which allows of the present agrarian agitation may be constitutional, but it is essentially unjust with the injustice of weakness. It is shocking that reckless demagogues should with impunity recommend to the populace acts of spoliation and violence, which are committed in accordance with their advice. The subscriptions to the different funds which benevolent persons are now raising would have been more liberal if the sums contributed were exclusively applicable to the benefit of innocent and peaceable sufferers. The Government will undoubtedly do its utmost to prevent distress, probably by either gifts or loans derived from the Irish Church fund. Private liberality cannot be altogether independent of the conduct of those who apply for aid.

From the scanty reports of Mr. PARNELL's enterprise, it would seem that he has himself no definite notion of the objects which are to be accomplished by his mission. In his first speech to an Irish meeting he solicited contributions to two separate funds, one nominally for the relief of distress, and the other for the promotion of his communist agitation against landed property. His appeal to the generosity of his audience was perhaps less effective because for rhetorical purposes he professed to value sympathetic enthusiasm more even than money. It might naturally be inferred that demands preferred with such a qualification were not immediately urgent. His affected indifference seems to have been confined to the strictly charitable fund; but even American Irishmen and New York servant-girls may doubt the necessity of subscribing to an agitation for the refusal of rent. Non-payment of just debts is a self-rewarding virtue, which ought to involve no accessory cost. Seditious Irish occupiers who hold a firm grip on the land for which they undertook to pay rent may well afford a small contribution to the expenses of anti-rent meetings. It is not necessary to address sound and reasonable arguments to such assemblages as those which received Mr. PARNELL in New York; but adroit demagogues generally propose to their hearers some plausible and tangible object. Mr. PARNELL must have still further puzzled the audience by asserting that the large sums which are in fact forwarded by Irish emigrants to their kindred at home are really intercepted or appropriated by the landlords. It is hardly worth while to contribute to the relief of Irish distress if the subscriptions are applied to the payment of arrears of rent. That the whole statement is unfounded may matter little as long as it tends to check the liberality which Mr. PARNELL professedly invoked.

Some surprise seems to have been caused by Mr. PARNELL's disavowal of any purpose of rebellion. As he appeared to care little about Irish distress, and as the agitation against landed property was intrinsically remunerative, it may have been naturally assumed that Mr. PARNELL was a Fenian emissary in disguise. Irish agitators before and since the days of O'CONNELL have been in the habit of hinting mysterious intentions which were to be discerned only by those who were in their confidence. Money might have been forthcoming for rifles and pikes; but, if there is to be no civil war, it may seem unnecessary to subscribe. A notice which has been posted in some parts of New York in the name of the Fenian Association is probably spurious. In the document Mr. PARNELL is denounced as an intruder who would divert the funds appropriated to rebellion in Ireland to the less sacred purpose of robbing the landlords. It is not probable that the promoters of disorder and anarchy will be in a hurry to publish their internal dissensions; but Mr. PARNELL's agitation will nevertheless be regarded with jealousy by the Fenian ringleaders. The unfavourable criticisms of his oratory which have appeared in some of the reports may perhaps be attributed to dislike of competition. It is said that Mr. PARNELL is not loud enough, that he is wanting in humour, and that he has not the traditional Irish secret of stirring a multitude to violence. It is probable that a gentleman by birth and education may not have altogether succeeded in acquiring the tone of a disreputable profession. The defects which are attributed to Mr. PARNELL as a mob orator were regarded as redeeming qualities in the House of Commons. In process of time he may hope to get rid of any remnant of self-respect and refinement which may at present impair his success as a demagogue.

The agitation among Irish settlers in America excites but languid interest; for it matters little whether one of many would-be demagogues excels his competitors in the art of exciting their prejudices and passions. The reception of Mr. PARNELL by the real Americans will be watched with more genuine curiosity. When the Fenian conspiracy was in progress there was much cause for irritation in the countenance which the scheme received from a large part of the American people, and from the highest authorities. Some of the Fenian ringleaders were formally welcomed on the floor of the House of Representatives, and the adventurers who in open violation of the law of the United States invaded the Dominion of Canada were immediately released from custody by the President. The English Government afterwards submitted to an arbitrary distinction which was drawn in the Treaty of Washington between the notorious breach of neutrality in the Fenian invasion and the doubtful infringement of neutral rights by the escape of the *Alabama* from Liverpool. The prudent equanimity of the English nation under great provo-

cation has, perhaps, after the lapse of several years, been rewarded by an abatement of hostile feelings in the United States. Mr. PARNELL is now not welcomed with unanimous cordiality merely because he is an enemy of the English Government and Constitution. Some American journals have already denounced his mission; and perhaps their example may be followed. The presence of the most orthodox veteran of the Republican party at the Irish meeting in New York may perhaps be explained as the result of mere curiosity; and if other Republicans support Mr. PARNELL, it may be supposed that they hope to detach a few Irish votes from their Democratic opponents. Almost everything which is said and done by American politicians has some reference to elections; and consequently it may be assumed that, if Mr. PARNELL receives no popular welcome, there is nothing to be got by professing animosity to the Government of England or to the landowners of Ireland. As agricultural land in the United States is seldom charged with payment of rent, the subject will excite no serious interest. The better class of Americans can have no disposition to diminish the security of property; and they understand that Mr. PARNELL's doctrines involve the repudiation of other debts as well as of those which are due to landlords.

FRENCH MINISTERIAL PROSPECTS.

TWO quite opposite views may be taken of the new French Ministry, and very good reasons may be urged in justification of both of them. The one rests mainly on the declarations, not eighteen months old, of the PRIME MINISTER himself; the other rests on the circumstances in which he has succeeded to his present office. In the autumn of 1878 M. DE FREYCINET visited a number of important French towns and made speeches on behalf of the Government. For the time he was the most conspicuous figure in the French Cabinet, and it is allowable to suppose that he even then thought it possible that he might one day be its head. The drift of these speeches was perfectly uniform. They were all of a highly conciliatory type, and were mainly directed to show that there was nothing in the Republic that need frighten any Frenchman who was prepared honestly to submit to it. If there should prove to be anything more alarming, M. DE FREYCINET was ready to concede beforehand that it would be bad. The genuine Republic would address itself to patriotic men of all shades of opinion. It would win adherents by convincing them that, whatever might be their special views, they would enjoy them with greater freedom under a Republican than any other form of government. There could not be a time which more calls for the application of these principles than the present. The Republican Government has contrived during the last year to alienate two very important bodies in the country—the clergy and the Civil Service. With a little encouragement the secular priests might have been led on into setting up schools which might have held their own by the side of the schools taught by the religious orders; but the direct attack of which the latter have been the object has made it a point of honour with every parish priest to support them. The machinery of promotion would of itself secure the allegiance of the great majority of Government officials, and thus insensibly win over to Republican ideas a large number of Bonapartists and Royalists. But the singular policy of the Republican party has made it clear that the best card a Bonapartist or Royalist official can play is at once to resign on political grounds. In that case, he will at all events retain the goodwill of his party, and establish a claim on their services, if ever they have the opportunity of rendering any; whereas, if he tries to keep in with the existing Government, he will almost certainly fail to do so. All this is very unlike that policy of conciliation which M. DE FREYCINET preached in the provinces in 1878, and if we had only his speeches to go by, the natural conclusion would be that the principal measures introduced or promised by the late Cabinet would now be either withdrawn or modified.

The history of M. DE FREYCINET's succession to the Prime Ministership is in entire contradiction to this theory. In that he appears as the chief of the Radical section of the late Cabinet, dissatisfied with M. WADDINGTON's tendency to compromise, and for some time distrusted by M. GRÉVY on that very ground. According to this view, M. DE FREYCINET's policy will differ from M. WADDINGTON's in being more frankly and consistently Radical. M. WADDINGTON has chastised the clergy and the bureaucracy with whips, M. DE FREYCINET will chastise them with scorpions. M. WADDINGTON has given promises to the Left, M. DE FREYCINET will translate those promises into performance. M. WADDINGTON has consented to the introduction of Radical measures, and then allowed them to remain suspended between the Chamber and the Senate. M. DE FREYCINET will force the majority in the Senate to choose its side and to be known to France as either the friend or the enemy of really Republican legislation. This expectation is certainly borne out by the incidents which preceded the announcement of the new Cabinet. It was understood that the cause of M. GRÉVY's hesitation about leaving M. DE FREYCINET entire freedom in the choice of his colleagues was his unwillingness to see any further advance in the direction of Radicalism. When this objection was overcome, M. DE FREYCINET's first act was to omit the Left Centre from the combination, and to make the Cabinet a genuine representative of the pure and advanced Lefts. M. GAMBETTA's influence was stated to have been used in favour of M. DE FREYCINET; and if M. GAMBETTA is to be judged by the *République Française*, he only tolerates M. DE FREYCINET on condition that he adopts a more radical line than his predecessor upon all the questions which have come or are likely to come before the Legislature. In another week it will probably be known which of these conflicting expectations is the correct one. Either way M. DE FREYCINET will find it a difficult task to reconcile his attitude in 1878 with his attitude in 1880. If he has really become the Radical politician he is accused of being, he must plainly have thrown overboard all ideas of conciliation. The purification of the Civil Service, the alteration of the tenure of judgeships, the expulsion of the religious orders from schools, are all measures which even those who regard them as indispensable to the welfare of the Republic must admit to be measures of warfare, not of pacification. It may be necessary to offend one half of French society in order to give the other half the security it needs; but it is impossible to deny that offence will be given. If, on the other hand, M. DE FREYCINET, in spite of all appearances to the contrary, remains the moderate and conciliatory politician he showed himself during his tour, it will be interesting to see how the pure and the advanced Left take the change. They can have no interest in turning out M. WADDINGTON in order to replace him by a stronger and more resolute man of the same aims and the same temperament. Ministers are to make a declaration of some kind when the Chambers meet next week, so that the uncertainty under which we now labour is in a fair way to be shortly removed.

M. DE FREYCINET has had to begin his career as Prime Minister by the settlement of a delicate piece of negotiation. An article which has lately appeared in the *Cologne Gazette* sets out with remarkable frankness the real motive of the attention which Germany bestows upon French affairs. There is reason to believe that the *Cologne Gazette* merely gives publicity to the views of Prince BISMARCK, and in that case we may infer from its remarks what kind of representations M. DE FREYCINET has had to make at Berlin. Germany, according to the *Cologne Gazette*, has a very real but a very limited interest in French politics. There is no French party in whose fortunes Prince BISMARCK takes the slightest interest for its own sake, and none in which he does not take a keen interest for the sake of Germany. The writer in the *Cologne Gazette* seems to find especial pleasure in informing French Royalists that, though the CHANCELLOR is an ardent monarchist in Prussia, he is altogether unconcerned with the prospects of monarchy in France. He has none of the spirit which actuated the Holy Alliance. A Jacobin President would suit his purpose better than the Count DE CHAMBORD himself, supposing that the Jacobin President was anxious to keep the peace and the Count DE CHAMBORD was inclined to break it. As regards France, breaking the peace has at this moment a peculiar meaning. It stands for a disposition to make an alliance with Russia. That would be a sin which Prince BISMARCK could not put up with. It could have no object but hostility to Germany, and a desire to undo the results of the late war; and the first moment that these feelings show themselves Prince BISMARCK will know how to deal with them. M. DE FREYCINET now carries a certificate from the German CHANCELLOR that

he has no evil designs in this direction. At first Prince BISMARCK was not quite easy on this head; but M. DE FREYCINET has been able to reassure him, and the relations between the two Governments remain perfectly cordial. Prince BISMARCK, whether he speaks by himself or by others, is seldom wanting in candour; and, whatever happens, the French Government cannot complain that they do not know what to avoid if they wish to retain Prince BISMARCK's goodwill. It is not pleasant for the Prime Minister of a Great Power to be admonished in this way in the face of all the world; but France may console herself by the recollection how much more bitter the experience would have been some years ago. Then France could not have defended herself to any purpose; now she has a large and enthusiastic army, which would at all events make the progress of an invader very much slower and more uncertain than it was in the autumn of 1870. The progress upward after a great reverse is necessarily gradual, and the change from interference in purely domestic matters to interference in the choice of foreign alliances marks a genuine advance in the estimation in which France is held by Germany.

AFGHANISTAN.

THE object of the mission of ABDERRAHMAN KHAN is probably to secure to his Russian patrons a share in the partition of Afghanistan. If he were formidable as a pretender to the whole of the former dominions of his family, he might perhaps rather diminish than aggravate the difficulties of the Indian Government. It had already been observed that the leader of the troops which lately occupied Cabul might possibly have done a service to his enemies in appointing the youthful son of YAKOOB KHAN as his nominal successor. As the war must sooner or later merge in negotiation, it will be in the highest degree convenient to recognize some representative of the Afghans with whom covenants may be made. Six months ago there seemed to be little dispute as to the title of YAKOOB KHAN, who accordingly concluded the ill-fated Treaty of Gundamuk. His subsequent abdication created a new embarrassment; and the doubts which exist as to his complicity in the treacherous attack on the English Residency have perhaps made his restoration impossible. An arrangement made in the name of a minor, though it might be preferable to an indefinite continuance of the war, would be always subject to disavowal if the chiefs no longer found it for their interest to support his pretensions. A mature descendant of DOST MAHOMMED, not without experience of war and civil government, would be more acceptable as an opponent who might be converted into a friend. ABDERRAHMAN must differ widely from other Afghan chiefs, if his gratitude to the Russians, whose hospitality he has long enjoyed, would present an insuperable obstacle to the acknowledgment of his claims. If he could establish his authority over his own countrymen, he would probably choose his alliances with a dispassionate regard to his own interest; and the late campaign must have convinced all reasonable Afghans that the Indian Government is the most formidable of neighbours, and therefore the most desirable of friends. The release or ostensible escape of the Afghan pretender is not unconnected with the proposed expedition against Merv; but it may be doubted whether General KAUFMANN will find that a possible embarrassment to the Indian Government affects the resistance which may be offered by the Turcomans.

There is no reason to suppose that in Cabul or in the greater part of Afghanistan ABDERRAHMAN has any party on which he can rely. He never assumed the title of Ameer, though many years ago he was the principal supporter of his father and his uncle in their successful struggle with SHERE ALI. He was afterwards more than once defeated by YAKOOB KHAN, whose services were rewarded by an imprisonment which seems to have affected his bodily and mental vigour. The relation of the BARUCKZYE dynasty to the people of Afghanistan is but imperfectly understood. It is sometimes positively asserted that the family has no longer any hold on the loyalty of the population, and it would seem that at Candahar its members are really powerless. On the other hand, the circumstance that SHERE ALI and all his numerous competitors claimed under DOST MAHOMED, would seem to indicate a general recognition of the title of the dynasty; and the recent nomination of the young MUSA KHAN tends to the same conclusion. In the stage of civilization which the Afghans have reached, the supreme power is almost always at the same time hereditary and elective. The ablest or most popular member of the reigning family is preferred both to direct heirs and to claimants who rely exclusively on personal services or qualities. It is true that the BARUCKZYE family is of recent origin, but in Oriental countries legitimacy ripens fast. Forty years ago Lord PALMERSTON made a disastrous mistake in assuming that SHAH SOOJAH, who had himself actually reigned as Ameer, could exercise any influence over his former subjects. It is possible that the tribes which lately dispersed after the failure of the attack on Sherpur might rally round ABDERRAHMAN, if he presented himself as the national champion against the victorious invader; but he could scarcely hope to change the fortunes of the war, and it would not be safe for him either to admit his inability to face the enemy or to court fresh defeat.

On the whole, it seems probable that he will confine himself to the enterprise of establishing his authority at Balk and in Badakshan. He is well known in Afghan Turkestan, from which in the civil wars of fifteen years ago he drew the mass of his troops. He will now appear in the Northern provinces with all the advantage which may be derived from the direct or indirect support of the Russian Governor-General. His release or mission tends to confirm the suspicion that the Russian authorities had been engaged in intrigues with SHERE ALI at a time when it was believed that their Government had promised to refrain from political action in Afghanistan. It would evidently have been impolitic to allow ABDERRAHMAN to escape so long as it was thought expedient to conciliate the good will of SHERE ALI. It is said that ABDERRAHMAN assured General KAUFMANN that with 100,000 roubles he could raise an insurrection; but a reigning accomplice is more serviceable than an instrument who is only a pretender. As long as ABDERRAHMAN would have thwarted Russian policy by his presence in Afghanistan there was no difficulty in preventing his departure from Tashkend. Now that circumstances have changed, it is not surprising that he should have been allowed to visit Bokhara, and still less that he should have failed to return to the capital of Russian Turkestan. He will soon be heard of in some of the Northern provinces; and perhaps an opportunity will be offered of testing the soundness of one of the commonplace charges against the English Government. It has often been said that a wise Government would have allowed the Russians to take precedence as invaders of Afghan territory. The native population would then have been opposed to the intruders, and they would have welcomed English assistance. If ABDERRAHMAN presents himself at Balk as a dependent of Russia, he ought, according to the theory of the English Opposition, to provoke universal indignation.

There will be little use in diplomatic remonstrance. The Russian Government will perhaps express surprise, and even disappointment, at the evasion of ABDERRAHMAN; but it will decline responsibility for the future proceedings of a guest who could not be treated as a prisoner. Some recent visitors who have arrived at Tashkend since the repulse of the attack on Sherpur may perhaps also return shortly to Afghanistan. It is doubtful whether the Russian Government will avow the intention of interfering in the disturbances which may be anticipated in Afghan Turkestan. During the negotiations which were commenced by Lord CLARENDON and concluded by Lord GRANVILLE, Prince GORTCHAKOFF, after some hesitation, agreed that Badakshan should be included in those dominions of SHERE ALI within which Russia was to exercise no political action. The engagement was professedly revoked or suspended when it was thought probable that a rupture might take place between England and Russia. The Mission to Cabul was defended on this ground, and the justice of the Russian contention was not seriously disputed. When amicable relations were ostensibly renewed after the conclusion of the Treaty of Berlin, Lord SALISBURY formally inquired whether the understanding relating to Afghanistan was still in force. After some exchange of explanations, Count SCHOUVALOFF declared that his Government was prepared to renew the arrangement; and Lord SALISBURY accepted the offer. There could be no doubt as to the sense attached by the English Government to the agreement; but, as in many other instances, the Russians had an unsuspected interpretation of their own. Professor MARTENS published two or three months ago a pamphlet, since largely circulated in

an English version, which probably represents the official explanation of the compact. The English Government, when the negotiation was in progress, desired, as at all other times, that Afghanistan should be independent, though they reserved the right which was withheld from Russia of controlling Afghan policy. The term "inde-"pendence" was accordingly used; and now Professor MARTENS argues that any English violation of Afghan independence avoids the whole arrangement. In the correspondence Prince GORTCHAKOFF expressly stipulated that the English Government should prevent SHERE ALI from encroaching on the territory of the Northern Khanates, or, in other words, that they should treat him as a dependent. The English Ministers certainly never suspected the interpretation which is now put on the agreement; but they ought to have criticized the words with the astuteness of an old-fashioned special pleader bent on guarding against a possible demurrer. Professor MARTENS, by his own ingenuity or with the aid of official suggestions, has hit the blot which it is perhaps too late to prevent. It is said that Prince LOBANOFF, who is expected in London at the beginning of February, will bring with him conciliatory instructions. Lord DUFFERIN will not fail to exert his great abilities in favour, not only of peace, but of a friendly understanding; but in the meantime ABDERRAHMAN will perhaps organize a Russian dependency in Northern Afghanistan.

MR. GLADSTONE COMPLAINING OF MISREPRESENTATION.

MR. GLADSTONE has within the last few days contradicted the statements of two members of Parliament; in one case with ceremonious courtesy, in the other case without courtesy of any kind. Both speakers had, as it appeared, made themselves liable to a charge either of verbal inaccuracy or of inferences which, according to Mr. GLADSTONE, were founded on insufficient evidence. Mr. GRANTHAM complained that in one of his Scotch speeches Mr. GLADSTONE had attributed to the outrages of Fenian conspirators his own conversion to the opinion that the Irish Church ought to be disestablished. The statement was denounced by Mr. GLADSTONE in the strongest language, as not only untrue, but monstrous; yet the substance of Mr. GRANTHAM's charge is wholly unaffected by Mr. GLADSTONE's own report of his language. Many readers have been shocked at the reckless imprudence of an assertion by an ex-Prime Minister that a great legislative measure was the result of a murder and an explosion. The precise method by which the effect may have been produced is of secondary importance. Mr. GLADSTONE had not in fact said that his own convictions as to the expediency of disestablishment were produced by the Manchester and Clerkenwell crimes. He had himself, it seems, been previously willing to destroy the Establishment; and it was the country, and not himself, which responded to the Fenian invitation. Mr. GLADSTONE's judgment was only so far changed that he now regarded as practicable what he already deemed to be just. He was therefore indirectly convinced by the physical arguments which Mr. GRANTHAM had supposed to have operated more simply on his understanding. The impropriety of inviting criminals to rely on violence at a time when outrage was notoriously reviving in Ireland is in no degree modified by the correction of an inaccurate report.

The controversy between Mr. GLADSTONE and Mr. BOURKE refers not to an alleged misquotation, but to a question of fact. Mr. BOURKE, in his speech at Leeds, spoke of Mr. GLADSTONE as having, in 1876, sent an emissary to St. Petersburg to translate his notorious pamphlet into Russian, for the purpose and with the result of prolonging the Servian war, of encouraging the enlistment of Russian volunteers in the Servian army, and of eventually promoting the greater war between Russia and Turkey. There can be no doubt that all these results followed from the publication of the Bulgarian pamphlet in Russia; but Mr. GLADSTONE denies that he sent an emissary to St. Petersburg, or that he took an active part in causing the translation to be made. His contradiction of that part of the statement must of course be accepted as far as it is direct and complete. But Mr. GLADSTONE admits that he gave his consent to the translation; and he probably knew at the time that the translator was about to proceed to Russia. The consent and the subsequent journey might not perhaps strictly constitute a mission; but Mr. BOURKE had not unreasonably formed his conclusion from the publicly reported statement of Mr. ALEXANDER, the alleged emissary, himself. It would not be surprising if an obscure meddler with political agitation magnified the importance of his own position, and exaggerated the condescension shown in a single interview or letter into a relation of friendship. Mr. GLADSTONE says that he was not personally acquainted with Mr. ALEXANDER; but Mr. BOURKE had no previous reason for disbelieving the assertion attributed to that person by the Russian journals that he was a friend of Mr. GLADSTONE. The so-called emissary attended a meeting of the Slav Benevolent Society, which, as it was well known, was a political organization for furnishing recruits and supplies of money and stores to the Servian army. The visitor, being welcomed as a representative of English sympathy with Russian aggression, is reported to have acknowledged with due modesty his own unworthiness of the honour, except as the follower or shadow of the great statesman who was his friend. Mr. BOURKE could have no ground for supposing that the statement was untrue or the report incorrect. Mr. GLADSTONE's rebuke falls more heavily on his officious admirer than on the political opponent who assumed an uncontradicted statement to be true. If the inquiry into the dispute had been legally conducted, Mr. BOURKE would have secured the verdict. The acts of a person authorized for a limited purpose, who had exceeded his commission, would have made the principal responsible. An election judge would certainly have held that the translator, in attending the Russian meeting, was a recognized agent.

The letter which Mr. ALEXANDER has addressed to the *Daily News* amounts to an admission of Mr. BOURKE's material statements. Mr. GLADSTONE's letter had left Mr. ALEXANDER in the position, if not of an emissary, of a *bouc émissaire*, or scapegoat. His own explanation shows that the paragraphs quoted from the Russian papers are substantially accurate. Mr. ALEXANDER indeed is not acquainted with Russian, and therefore it may be presumed that he had not translated Mr. GLADSTONE's pamphlet. Having been allowed by his principal to act as an agent for the purpose of causing a translation to be made, he seems to have received credit among the Russian war faction for an imaginary confidence which had not in fact been reposed by Mr. GLADSTONE in a stranger. His ignorance of Russian scarcely explains his acquiescence in statements published in French. Mr. ALEXANDER does not deny that he spoke of his friendship for the statesman whom he was supposed to represent, although he thinks that his style has been corrected in the published version, and that things are put into his mouth which he did not say. Mr. ALEXANDER boasts that he spoke and wrote in Russia, though apparently not in Russian, on behalf of the cause which he describes as the liberation of the East. Mr. BOURKE had complained that an agent or emissary of Mr. GLADSTONE had done what Mr. ALEXANDER, who, though he objects to the term, was Mr. GLADSTONE's agent for a special purpose, actually did. Translations into French, German, or Italian, produced no political result, except to justify the opinion which prevails on the Continent as to Mr. GLADSTONE's policy. A Russian version, issued with the sanction of the author, was a direct appeal by himself to the Power which already meditated war in favour of armed intervention. It was allowable to suppose that the person who had been employed to circulate Mr. GLADSTONE's inflammatory address was also entitled to speak, as he is reported to have spoken, in his name.

In this instance, as in the matter of disestablishment, the indiscretion which was the real subject of the charge was undoubtedly committed. According to a rumour of the time, which seemed to be supported by credible evidence, the Emperor of RUSSIA seriously resented the aid which Mr. GLADSTONE gave to the war party among his Ministers and his subjects. In assenting to the publication of the Russian translation Mr. GLADSTONE distinctly attempted to influence Russian opinion. He could not but know that the unprovoked attack of Servia on Turkey was stimulated by an active faction in Russia, and that a Russian army was gathering on the Turkish frontier. On more than one occasion he professed a belief in the disinterested benevolence of the Power which was hesitating on the verge of invasion. His purpose, as far as it could be inferred from the language of his enthusiastic followers, was to precipitate a doubtful war. About that time a

journal which is always devoted to his person and his policy expressed a hope that the war might be postponed for a few months, in order that the Russian clergy might have time to raise to the highest point the fanaticism of the people. In his last letter to Mr. BOURKE Mr. GLADSTONE expresses a whimsical surprise at the supposed inaccuracy of a Foreign Under-Secretary who has access to the best sources of information. The points immediately in dispute could scarcely be elucidated by official documents; but probably Mr. BOURKE may have better means than others of knowing the relation between the Bulgarian agitation of 1876 and the war of 1877. It is at least evident that he attributes a mischievous effect to Mr. GLADSTONE's intervention.

It is perhaps reasonable that the most indiscreet of political speakers and writers should be eager to disclaim objectionable phrases which he has not literally uttered. Mr. GLADSTONE has not yet repudiated the most wanton and most dangerous proposition which he enunciated during his tour in Scotland. While Mr. PARNELL was urging excited Irish mobs not only to refuse payment of rent, but to insist on a transfer of the property of landlords to the occupiers, Mr. GLADSTONE took occasion to state that, if the creation of a class of peasant proprietors should be deemed expedient, Parliament might not only justly but laudably expropriate the actual owners on payment of compensation. Mr. PARNELL himself had from time to time contemptuously recognized the right of compensation, if only a fund could be discovered from which the payment might be made. Mr. GLADSTONE vindicated by anticipation a compulsory transfer, as soon as a majority in Parliament should be convinced that small freeholds would be socially or economically advantageous. It is highly probable that the theory would find favour with an English House of Commons elected by universal suffrage; and it is quite certain that an Irish Legislature under Home Rule would echo the wishes and opinions of small occupiers who wished to be owners. The assessment and payment of compensation would be more doubtful. In Midlothian Mr. GLADSTONE made expropriation contingent on the approval of a certain economical doctrine. He has since, in a published letter to an Irish correspondent, raised another objection which is still less likely to be final. He has not, he says in his curious style, yet found the element of practicability in any scheme which has been proposed for the expropriation of landlords with compensation. Mr. PARNELL and his followers will not be slow to prove that spoliation with a nominal equivalent in money is practicable; and Mr. GLADSTONE apparently assumes that it is just. In the same letter Mr. GLADSTONE expresses his intention of paying careful attention to any proposals for the improvement of the land law in Ireland. It had been thought, or at least it was said, that the Irish Land Act had included extreme remedies which could only be justified by the extreme urgency of the case.

ITALY AND THE PAPACY.

THE relations between the Vatican and the Italian Government have not materially altered since the occupation of Rome and the passing of the Law of Guarantees. Lapse of time has already given an air of finality to a deed regarded by the one party as robbery aggravated by sacrilege, and by the other as the just fulfilment of the national aspiration after unity. Since the capital of Italy has been fixed in Rome there has been a change of Kings and of Popes. The Conclave was held with as much freedom as ever. The new KING ascended the throne without challenge. It might be thought that the time has come to shake hands, and let bygones be bygones. It seems useless for the Vatican to hope to see the work undone which had been so long prepared by a concurrence of very various causes, and foolish to prefer the precarious offerings of the Roman Catholic world to the subsidy from the Italian Government which only awaits the POPE's acceptance. But still the two parties draw no nearer to one another. The POPE has not yet quitted the precincts of the Vatican. Not a penny has been accepted by him from the national exchequer. Only in certain exceptional cases have the Clericals taken any open part in public life. No sort of official recognition has been given by the Vatican to the new order of things. One wonders whether all this is merely a decent show kept up for the sake of consistency and to impose on the outside world, or whether the hope is really entertained at the Vatican that the Temporal Power will be restored. By a large section of Roman Catholics it is; and nearly all Roman Catholics out of Italy would like to see it even if they do not think it feasible. But there is a wide difference between what the ardent Roman Catholic in England or Belgium would do, and what commends itself to the more dispassionate statesmanship of the Vatican. Still the question remains an open one; and, though not dangerous to Italy at the present moment, it might become so in consequence of changes either in the general situation of Europe or in the internal condition of Italy itself.

Signor JACINI, the well-known Italian senator and political writer, devotes a part of his last interesting work (*I Conservatori e l'Evoluzione Naturale dei Partiti Politici in Italia*) to a consideration of the possible methods of solving the difficulty. The book gives a general survey of Italian politics; but the chief interest of it for the foreign reader lies in the treatment of the international problem which so strangely interweaves the fate of Italy with that of other countries. The head of the Catholic Church has now for three centuries and a half been always an Italian; his seat is in the capital of the Italian kingdom; the predominant element in the College of Cardinals is Italian; and yet Italians form only a small part, and that probably the most indifferent part on matters of religion, of the whole body of Roman Catholics throughout the world. The Catholic Church, which has been so often the enemy of Italy, is a standing evidence of Italian genius. In one way, which has not been enough considered, it has done without malice prepense as much harm to the country as it ever did purposely. It has absorbed a large part of the talent, especially of the political talent, which Italy produces. To work, to guide, and to develop an organization so vast, so complicated, and so many-sided, demands a skill a little greater than that required to become a conspicuous figure in the Chamber of Deputies. A Cardinal is a greater personage than a Minister, and an ambitious man, if the two paths were equally open to him, would rather rise to eminence in the Church than in the State. One cause of the anæmic condition of Italian politics is certainly that the Church drains off a great part of the talent, ambition, and energy which in a normal condition of affairs would be employed in the service of the State. Were they in Italy, Mr. GLADSTONE would probably be Cardinal Prefect of the Propaganda, and Lord BEACONSFIELD Pope. He would sit in state with the triple crown on his head, and he would dispense the apostolic blessing *urbi et orbi*. It is more than a coincidence that the Italianization of the Papacy was synchronous with the political ruin of Italy in the sixteenth century; that, until the movement which led to the formation of the kingdom of Italy, the country lay from that time forward in a state of political paralysis; and that, now that Italy is united and the exceptional stimulus of the new principle of nationality relaxed, the country shows ominous signs of relapsing into political inertia. The international organism is fed at the expense of the national. It is thus among Italians themselves that the ranks of the most formidable enemy of Italy are recruited. And whatever arrangements may be made in course of time between the Vatican and the Italian Government, it is hard to see how, except by the breaking up of the universal Church into a number of separate national Churches, this source of weakness to Italy can be greatly diminished.

These speculations, however, carry us further into the future than the practical exigencies of the moment require. No great fundamental change in the attitude of the Catholic Church is to be looked for yet. The question for Italy is to find out the way in which the temporal and spiritual Governments, as they are, can get on side by side with least friction. One would think that the present arrangement, provisional as it certainly is, worked well enough, and that the Italian Government, having guaranteed to the POPE the free exercise of his spiritual functions, and offered him a handsome allowance into the bargain, had done all that was required of it, and might wait in patience till the Vatican thinks proper to take the initiative in further transactions. Signor JACINI, however, thinks the present situation not free from danger. At the time of the occupation of Rome by the national forces in September 1870, none of the Great Powers were disposed to challenge the

action of the Italian Government. England, Germany, and Russia were indifferent or friendly; France was paralysed; Austria was kept quiet by Russia; Spain had got rid of Queen ISABELLA. Now, too, there is no Power in Europe inclined to put even diplomatic pressure on the Italian Government for the sake of the POPE. If it were not for the wretched *Italia Irredenta* business, it might be said that no Power enjoyed such universal goodwill as Italy. But, had the Legitimist monarchy been restored in France, or even were the Empire to be set up again, complications with Italy on the score of the Papacy would be by no means impossible. And there is no guarantee that the present state of Europe is going to last. A general war, out of which the Great Powers may come with their frontiers and their relative importance wholly altered, is not only possible, but may begin at almost any moment. Further, the break-up of old beliefs and traditions, which has made great way in all countries, and which has undermined society in some, may bring about in Europe a deluge of anarchy in which the Church will seem to be the one ark of refuge. These are no chimerical dangers; they are real and at our doors. Considering, then, all the chances of the future, is it not wise, asks Signor JACINI, for the Italian Government to come to a definite agreement with the Vatican, and to embody this agreement in an international document, which would receive the formal sanction of all the Great Powers?

No doubt the Catholic Church is a vast power in the world, and no prudent statesman will wantonly provoke it; but it appears to us, as it appears to the majority of Italians, that no dangers from the side of the Vatican would be comparable to the danger, to say nothing of the humiliation, of giving other Powers, however indirectly, the right to interfere in Italian affairs. In Signor JACINI'S proposed treaty or document there would be two chief articles—one guaranteeing the freedom and inviolability of the Head of the Church, and the other settling in perpetuity on the Papacy a capitalized property, the annual revenue of which would be equal to the sum now offered by the Italian Government but refused by the POPE. But it is hard to see what substantial good the sanction of other Powers would do Italy in making any such arrangement. Treaties with many signatures at the end of them are broken nowadays with the same unscrupulous freedom as treaties with few signatures. If it suited the purpose of a reactionary Government to pick a quarrel with Italy, no treaty could be so framed as to hinder it from doing so. Further, though a great increase of the influence of the Church in Europe is very possible in the immediate future, the contrary is also possible. The same disintegrating or transforming forces which are at work in the Protestant Churches must sooner or later operate on the Church of Rome. The when and the how can hardly even be guessed at; but it is not impossible that the time may be nearer than it seems. And in the worst case, even if the Papacy should grow much stronger than it is, Italians are better suited than all other nations to deal with it. It is their business more than anybody else's. The POPE is an Italian living on Italian soil, and claiming the right to frustrate Italian unity. Long and intimate experience has given the Italian people a tact, a sureness, and a skill in dealing with the Papacy possessed by no other nation. It is a matter on which they have little to learn from foreigners and a great deal to teach them. By inviting other Powers to take part in an international agreement regulating the status of the POPE, Italy would give all these Powers the right to watch over the fulfilment of every clause in the treaty, and to bar the way to any of the changes which from time to time would certainly become desirable. She would tempt other countries to assume an air of tutelage and interference which would breed more bad blood than any such treaty could possibly remove. She would transfer the management of a most delicate work from one Government to several, from skilled to comparatively untrained hands. She would tend to stereotype a policy in a matter where the utmost freedom of future action is indispensable. And she would get in exchange a guarantee illusory in an age when treaties are broken with cynical nonchalance whenever it suits the strong to violate them. Italian unity exists by the right which every nation has to belong to itself, and by the fact that Italians are prepared to defend it against all assailants. All the forces of the future are in its favour. For Italy to ask other nations to help her in doing her own historic work would be to proclaim a fatal want of self-reliance. For these reasons Signor JACINI'S proposal seems one that cannot for a moment be entertained, though his most suggestive little book can be recommended to all persons interested in the subject of which it treats.

LORD DERBY AT HUDDERSFIELD.

LORD DERBY'S address to the Huddersfield Chamber of Commerce on Thursday was marked by all his characteristic merits and by some of his characteristic defects. His review of the state and prospects of English trade was excellent; and as Lord DERBY is not by nature an optimist, it is pleasant to find that the conclusion at which he arrives is in favour of this country. Upon each of the three points which he selects as most important to have clear ideas about, he holds that things look less black than it has of late been customary to paint them. Whether we are richer or poorer than we were three years ago, there is no doubt that we are richer than we were ten years ago. The national income is larger, the national savings are larger, the national consumption is larger. And then, as Lord DERBY is careful to warn us, too much trust must not be placed in the figures which show either the profits in years of prosperity or the losses in years of adversity. It is the gain or loss of the producer that determines statistical returns, because this affects income. The gain or loss of the consumer only affects expenditure, and consequently does not appear in the returns, or only appears indirectly. Remembering this, we may deduct from the apparent depression of the last two or three years and from the apparent prosperity of seven years ago. "We were not as rich as we thought "ourselves in 1873, and we are not as poor as we are apt to "think ourselves now." One reason probably why the real position of the country varies less than its apparent position is that in all estimates bearing on this subject a disproportionate place is given to foreign trade. Important as the profits derived from that trade are, they only constitute one-seventh of the total income of the community; and, in presence of this fact, Lord DERBY rightly questions whether we are justified in speaking as though the industrial life or death of the nation depended on the keeping up of its exports. There has been exaggeration, too, as regards the falling off of our foreign trade. Lord DERBY contends that what has been described as a falling off is really only a check. "We produce as "much as ever we did, only we have had to "sell what we produce rather cheaper." He admits that American competition is not to be lightly spoken of; but he points out that the counter attractions of land-owning and farming must exercise very great influence on the labour market of the United States. Where the choice lies before them, men will commonly prefer being masters on their own farms to being workmen in some one else's mill. Even putting this aside, Lord DERBY thinks that the world is large enough for both England and America, and that the two countries will find there is an ample market for the productions and the manufactures of both. Whether Lord DERBY makes sufficient allowance for the closing of the American market against English goods, which, even without protective tariffs, can be hardly more than a question of time, is perhaps doubtful. As regards Continental competition he has no fear. The Continent has not the advantages which England has, and it has a disadvantage which England has not. It has not cheap coal, or cheap iron, or accumulated capital, or unlimited mechanical appliances, or a never-failing supply of trained workmen. It has the enormous drawback of the conscription, and wherever there is a conscription labour is not free. Lord DERBY weakens the force of his argument here by the exaggerated language in which he describes the military systems of the Continent. When he says that militaryism cannot coexist with industry on a great scale, he may perhaps be right, though even here the example of France seems to tell the other way. Ever since 1870 France has had a conscription of great severity. She has set the German army before her as an example, and she is doing all she can to come up to her model. Yet the description Lord DERBY gives of the

population with which alone a conscription is possible hardly seems to apply to the French nation. "Do you think," he asked the Huddersfield Chamber of Commerce, "that "emperors and grand-dukes and archdukes, field-marshals, "and tremendous personages of that sort, really want the "manufacturing interests of their empire to be developed? "Do you suppose it would suit them to have to do with "an intelligent, keen-witted, critical, and well-to-do "population such as our Northern towns in England contain? Depend upon it, they are not "such fools. They know their own business better. What "they want is something quite different—a peasantry "hungry enough at home to find the ordinary life of "a private soldier rather agreeable than otherwise, and "submissive enough to be ready to shoot their own brothers, "if ordered, without asking why." This may be a substantially correct description of the wishes of the tremendous personages in question, but it is not, in all cases, a correct description of the material they have to work with. It will certainly not be to our advantage to assume that so long as the present military system of the Continent subsists we shall have neither intelligence nor keen wits to compete with abroad. Lord DERBY cannot have forgotten all that has so often and so justly been said in praise of French and German intelligence. It was in virtue of this quality that Germany was enabled to inflict so tremendous a defeat upon France. It is in virtue of this quality that France has been able to recover from that defeat with such extraordinary completeness and rapidity. There is nothing gained by underrating our commercial rivals. Those who do it are sure to be undeceived in the end; but they may not then be able to recover the ground which they have lost. The truth is that Lord DERBY's just dislike to militaryism leads him to exaggerate its faults, or rather to see faults which it has not, as well as faults which it has. The conscription is an immense evil from many points of view, but it does not at present appear to exert that degrading and stagnating influence on those who are subject to it which Lord DERBY seems to attribute to it. Something of the same temper may be seen in the warning he gives his countrymen. If England, he says, is going into "the gunpowder and glory business," she may be successful, but she will certainly be poor. She was successful in 1815; but at no time in history were the English people "so poor, so miserable, and so dis-"satisfied as they were in the fifteen or twenty years that "followed Waterloo." This is true, though it is another question how much of this poverty was owing to bad government, which had no necessary connexion with the war that had preceded it. But Lord DERBY cannot mean to imply that the English people would have been better off in the long run if they had left NAPOLEON to build up his Empire unmolested. Lord DERBY recognizes "duty and "self-defence" as legitimate reasons for military adventure; and whatever may be said against English policy in the revolutionary war, it cannot possibly be contended that we opposed NAPOLEON on grounds which did not, to say the least, include duty and self-defence. There is nothing in Lord DERBY's words that is not true, but there is something in the collocation of them that is likely to be misleading.

Lord DERBY's remarks on Protection in the colonies are full of good sense, though we think that he is a little inclined to forget how many things influence human action over and above regard for material gain. He holds that when each separate interest finds that it can secure protection for itself only at the cost of paying for the protection afforded to every other interest, each separate interest will soon get tired of the game. That is true, no doubt, in the long run; but the run may be a very long one indeed Not only is each separate interest very much more alive to its gains than to its losses, but there grows up a kind of patriotic pride in the contemplation of the numerous industries existing in the colony in place perhaps of the single industry which would have existed there in the absence of protective duties. Nothing, however, can be truer than Lord DERBY's reminder that, if we wish the colonies to abandon Protection, we must be careful on the one side not to attempt to thrust Free-trade down their throats, and on the other not to express speculative doubts as to our own wisdom in adopting it. "Every "casual word of regret which is given to the abandonment "of protective duties among ourselves does harm outside "England. If we seem to hesitate, how shall we convert "those that are wavering?" Considering the part which low prices have played in enabling us to get through the recent period of depression, it is extraordinary that any one who is not a farmer should be found still hankering after dear goods.

HOUSES AND OWNERS.

THE letter from the Home Office which was laid before the Metropolitan Board of Works last week gives ample evidence of the pains and thought which Mr. CROSS has uniformly given to questions relating to the dwellings of the working classes. We have so often had occasion to differ from Mr. CROSS as to the practical value of his measures that it is at once a pleasure and a duty to bear testimony to the zealous care displayed in their preparation and execution. There is something almost melancholy in the minute attention which is paid in this letter to an inquiry whether some 1,600 people can be accommodated on a particular site supposing that it is dealt with as the Metropolitan Board proposes. These 1,600 people are not even an appreciable fraction of those who are at present condemned to live in houses which no care of theirs can make wholesome. Their condition differs from that of hundreds of thousands of their fellows in nothing but this—that by an accident their case comes within the purview of an Act of Parliament. In all parts of London where the poor live there are vast numbers not a bit better off in the matter of houses than they. These vast numbers could be much more easily dealt with than the exceptional groups to which the Artisans' Dwellings Act refers. There would be no sites to be cleared, and no new streets to be laid out. All that is needed to effect the necessary improvement is a sufficiently stringent Nuisance Act. Unfortunately, Mr. CROSS's mind has only been given to the exceptional cases. It is only the houses which no internal amendment could make fit for human habitation that seem to interest him. By comparison there are but few houses in so hopeless a condition; but this does not prevent the great majority of similar houses from being, for the time, equally ill suited to their professed purpose. If there are no adequate means of compelling the owner to see that the gas from the sewers does not go straight into the rooms in which the inmates live and sleep, a house which stands alone may be as unhealthy as one which stands at the end of a crowded court. Mr. CROSS has put the cart before the horse. Instead of prescribing a standard of habitableness below which no house should be suffered to fall, and then pulling down the houses which no amount of individual improving could make habitable, he has only dealt with the latter. It is a pity that when he had made up his mind to take hold of the subject at all he should have contented himself with touching only the fringe of it.

Considering the very heavy loss that has been inflicted on the Metropolitan ratepayer by the construction of the Artisans' Dwellings Act of 1875, Mr. CROSS's letter takes the money question a little too easily. It is true that Mr. LIDDELL is instructed to express Mr. CROSS's sense of the great difficulties the Board must experience in carrying out the Act. But the greatest difficulty of all is the cost; and a large part of the cost hitherto incurred has been incurred by reason of the false basis of valuation originally adopted. The Metropolitan Board complain, with great justice, that, down to August last, they were generally "required to pay for the worst class of property "almost as much as if there were no sanitary necessity "for its destruction." The arbitrator simply considered the actual value of the property to the owner, and made no allowance for the fact that the owner only obtained this value by omitting to make the houses fit for human habitation. On the principle of the Artisans' Dwellings Act, a butcher whose meat had been condemned as unwholesome might claim to be compensated for its destruction on the assumption that it was all cut from prime cattle. The consequence was that upon six sites out of thirty the ratepayers lost 643,461*l*. The sum actually paid for these sites was 734,766*l*., and the offer of the PEABODY Trustees, which under pressure from the Home Office was ultimately accepted, was only 91,305*l*. This shows the difference between the value of these sites when inhabited under wholesome conditions and their value when inhabited

under the conditions in which they were inhabited at the time when the Board purchased the ground. Upon whom ought this loss to fall? Clearly upon the owners, who have for years been making a nefarious profit out of houses which they ought long ago either to have closed or put into decent order. Under the Amending Act of 1879 it will fall on them for the future; but for the four years during which the Act was in operation previously to 1879, it fell upon the metropolitan ratepayers. Even now there is nothing to prevent the owners of property which has already been formally condemned from spending money on the buildings about to be removed, and claiming to have this useless outlay included in the valuation. Mr. CROSS, even now that he has seen the working of his measure, seems afraid to deal justly by a class of house-owners who, if they had got their deserts, would long ago have been given the choice between putting their property in habitable order and handing it over to those who would do so.

It is high time that the Government should come to some effectual determination whether the dwellings of the working classes are or are not a proper subject for legislation. There is much, no doubt, to be said against the principle of such legislation. It may be argued with considerable force that there is no reason why the State should interfere for the better housing of one section of the community more than for that of another. There are many badly drained and badly ventilated houses inhabited by the middle and upper classes, and as to these Parliament is content to leave the occupants to look after themselves. Why should it follow a different rule in the case of houses inhabited by the poor? The answer to this objection is, first, that within certain limits Parliament does now interfere on behalf of the community generally. The legislation we have suggested would introduce no principle which is not already recognized in the Statute-book. What is the object of the existing Building Acts if not to come between the buyer and the seller of houses? Why should not a builder be allowed to run up walls as thin and as high as he likes? Why is he made to take certain precautions against fire? It is the interest of the people who will take his houses to see to these things for themselves, and why should Parliament trouble itself to see to them on their behalf? The reason of course is that Parliament can look to these things far more effectually than the man who buys or hires a house. A public officer can inspect a house while it is building, and can ensure that it shall not be finished if the work is unduly scamped. An intending tenant probably does not see the house until the walls and ceilings are plastered, and perhaps papered, and he has no means of going beneath the whitened or coloured surface that meets his eye. Parliament is not invading the tenant's function when it undertakes to do for him what he cannot do for himself. The things which make a house wholesome come under the same principle as the things which make it safe. It would be perfectly possible to ensure that no house should be sold or let until a public officer had certified that it was properly drained and provided with a certain minimum of sanitary appliances. At all events, the multiplication of unwholesome houses might be prevented, instead of, as now, leaving it to go on absolutely without check. The second answer is that, even if Parliament did not interfere on behalf of the community generally, there are special reasons why it should interfere on behalf of the working class. They are much more helpless in this matter than the classes above them. They are less free to move about in search of lodging, and more forced by circumstances to take whatever rooms they can get. The precautions which the Building Acts have made compulsory are mostly directed to the prevention of accidents. But disease does far more mischief in the long run than accident; and, as regards a large class of diseases, it can be guarded against quite as easily and as surely as accident. But, if this end is to be attained, some rational, because comprehensive, method of dealing with the question must be adopted. To pull down at great cost an unwholesome street, when hundreds of houses not a bit better are left standing all around it, and hundreds more with precisely the same faults in them are being built every day, is neither comprehensive nor rational.

MR. CHAMBERLAIN AT BIRMINGHAM.

IT is perhaps unkind, if not altogether unreasonable, to expect that political speakers when they speak shall say something novel in matter, or at least in manner. However much or however little reason there may be about the expectation, there can be little question that it is generally disappointed, and never more often than in the speeches of the present Opposition. They have given themselves the word of command to attack the Government on certain vague and general grounds, and to this word of command they are strictly, if not profitably, obedient. In speaking at Birmingham on Thursday night Mr. CHAMBERLAIN observed that, in the coming struggle, "no man could shield his responsibility under the "plea that he had not information enough whereon "to base his decision." We shall not question this as a general statement. But, if it be so, the information is certainly not derived from the public utterances of Mr. CHAMBERLAIN himself and his political friends. The audience on Thursday night were indeed told, as innumerable audiences have been told before, that Parliament had ceased to represent the nation, that the foreign policy of the Government was a disastrous failure, that the Afghan and Zulu wars were very dreadful things for a Christian nation to be engaged in, that Ministers had lowered public morality, and that there was going to be a tremendous Liberal majority at the next election. Whether in consequence of the general lowering of public morality or not, Mr. CHAMBERLAIN does not seem to have explained. But we have heard all this very often before, and it has failed to carry conviction for very obvious reasons. Even supposing—an exceedingly large supposition—that most of these separate statements were incontrovertible, they would not make out the position which those who advance them wish to make out—the position that England can be rescued from danger and degradation by the simple process of driving Lord BEACONSFIELD out and putting the uncertain entity, which may be Mr. GLADSTONE and which may be Lord HARTINGTON, in. For the main objection, as Mr. CHAMBERLAIN must perfectly well know, which is entertained at the present moment, we believe by the vast majority of thinking people, to the latter proceeding, is that it would hand over the country and its concerns to persons whose own declarations have proved them incompetent to conduct those concerns. Grant—for the sake of argument—that the present Government have not managed the foreign policy of the country as well as they might have done, the difficulty remains that the last Government showed themselves unable, if they did not actually refuse, to manage it at all.

It was somewhat remarkable that Mr. CHAMBERLAIN, who is not generally deficient in boldness, shrank on this occasion from announcing, as Mr. GLADSTONE has announced, that England had better have no foreign policy whatever. We hear nothing in the Birmingham speech of the smallness of this island, of its littleness as compared with the great nations of the Continent, and so forth. And, indeed, it is probable that Mr. CHAMBERLAIN was wise in avoiding such a style of argument. For even in Birmingham, and among Birmingham Radicals, there is probably a very large number of persons whose ears would be by no means tickled by oratory of this kind. Birmingham is not accustomed to think lightly of itself, and there must be some men in Birmingham who see that, if England is to be slighted, Birmingham can hardly be magnified. Hence Mr. CHAMBERLAIN was thrown, even more than most Opposition speakers, into a course of general accusation and desultory reviling. His point of view for the nonce was that England is not a small, unimportant island, but a great and independent Power; and he professed to fear that her greatness and independence are menaced by the policy of the Government. There is perhaps something rather attractive in this argument, which would seem to infer that the greatness and independence of a nation are best assured by letting other Powers do exactly as they like. But it is hardly surprising that Mr. CHAMBERLAIN was only occasionally able to gain this Pisgah height of paradox. For the most part he confined himself to well-worn assertions, many of which could only be met with direct contradictions, while others were partly true, but not relevant to his argument. When a politician of influence, if not of great personal weight, talks of the present Parliament as being "the least independent since the days of WALPOLE," it is difficult to meet him on his own ground, or on any

ground where the weapons of polite controversy are used. That a Parliament which was elected by household suffrage and the Ballot, and which has had new blood to the extent of some twenty or five-and-twenty per cent. infused at by-elections from time to time, should be said not to represent the nation, is absurd enough. That it should be compared to a Parliament of nominees and borough-mongers, managed by perpetual and systematic bribery, is perhaps something more or less than absurd. Mr. CHAMBERLAIN pays his constituents one or both of two very bad compliments. The one is the supposition that they know nothing of English history, the other the assumption that they will think any stick is good enough to beat the present Government. A still better instance of the temper in which his observations were made was to be found in his reference to the approaching election. Mr. CHAMBERLAIN, like others of his party, politely informs the Government that it dares not consult the nation. But Mr. CHAMBERLAIN, unlike others of his party who have more of the wisdom of the serpent, ingenuously confesses that only eighteen months ago he was desperately afraid that the Government would dare to consult the nation. In other words, if a Ministry chooses its own time to go to the country it is wrong, and if it lets a Parliament run its natural course it is wrong likewise. Mr. CHAMBERLAIN is certainly a difficult person to please. He was, however, in this very speech good enough to indicate a way out of the difficulty. Parliament, he complained, was not elected upon the issues which it now has to decide. Of course it is clear what this means. It means—logically, at least—a series of *plébiscites*; an Imperialist device which we are surprised to find Mr. CHAMBERLAIN approving, if only by implication. Even the panacea of annual Parliaments would not meet the views of politicians of this kind. For between January and December there might always arise new issues, and with the new issues a new Parliament would be requisite. Indeed, it is not clear why a new Parliament should not be elected before every battle which is fought during a war, lest the course taken should unhappily cease to represent the national will. It is not often that political arguments can be so easily and glaringly reduced to the absurd.

The truth is, however, that this speech, which was not specially violent or paradoxical, is for that reason an excellent instance of the hopeless unreason which pervades, for the most part, the contentions of the present Opposition. Mr. CHAMBERLAIN, at any rate as represented by his reporters, is like NARCISSA "tolerably mild." He does not say in his haste that all Tory Ministers are *ipso facto* liars, and though he insinuates that Sir BARTLE FRERE would have been left in the lurch if he had entirely failed, he does not, as was done the other day, assert that he was sent out with instructions expressly calculated to that end. We stand half astonished at his moderation. But, after all, his attitude is exactly the same as the attitude—we shall not say of the official leaders of his party—but as that of Mr. GLADSTONE, Mr. BRIGHT, and, it must now be added, Mr. ADAM, a person whose position might, one would have thought, have made him more cautious. An ingenious and agreeable writer, some years ago, depicted this attitude well in a pleasing apologue of the dog and the badger. "I "don't like you," says the dog to the badger; "come out "of that earth." When the arguments of the extremer Radical speakers are reduced to their simplest terms, this is exactly what they come to:—"I don't like you; come "out of that Downing Street." The embellishments of "wickedness," "lying," "immorality," and all the rest of it which accompany this expression of opinion, are well represented by the barks of the terrier. Of course there is a good deal of this in all political warfare, and there are occasions when it does not very much matter. The present occasion, however, is hardly one of these. A contest where the compound householder is at stake, or where the point of the quarrel is the insertion or omission of this or that tax in the Budget, may be conducted in this spirit without much harm to anybody. But this is not the case here. The point mainly at issue is whether the foreign policy of England is to proceed on the lines which have made England great, or on entirely new lines which start from the assumption that she is small and little, and which lead round with unerring precision to the result of making her so. Some months ago, it may be remembered, the more sober and responsible members of the Opposition admitted that, if they succeeded to power, they could not dream of reversing entirely, or breaking utterly with, their predecessors' policy. It is not insignificant that, since this admission, a clamour has been raised for the restoration of Mr. GLADSTONE, who is pledged to exchange the foreign policy of the lion for the foreign policy of the ostrich. The happy flexibility of the logic of Mr. CHAMBERLAIN's most recent utterance forbids us to say which side he ought consistently to take in the controversy. But there cannot be much doubt on which side he would practically be found.

THE GREAT EDISON SCARE.

WHAT a happy man Mr. Edison must be! Three times within the short space of eighteen months he has had the glory of finally and triumphantly solving a problem of world-wide interest. It is true that each time the problem has been the same, and that it comes up again after each solution, fresh, smiling, and unsolved, ready to receive its next death-blow. But this peculiarity of his triumphs, though interesting from a practical point of view, is doubtless of too trifling a character to damp the joy of victory in Mr. Edison's own mind, since it appears in no degree to interfere with the plaudits with which his followers hail each fresh achievement—or, as we should rather say, bulletin—from Menlo Park. And thus not only is Mr. Edison to be congratulated on the happy past, but his friends may look forward to a long and equally happy future, crowned at periodical intervals by similar dazzling and final triumphs; for, if he continues to observe the same strict economy of practical results which has hitherto characterized his efforts in electric lighting, there is no reason why he should not for the next twenty years completely solve the problem of the electric light twice a year without in any way interfering with its interest or novelty.

But all this, we are told, is altered now. We are given to understand, by accounts from headquarters, that this time Mr. Edison really has done it, and descriptions of the perfection and economy of the light are showered upon us which quite take away one's breath. That the light itself is all that its inventor could by any possibility desire will not surprise any one who has had experience with inventors; but it does startle us to be told that its cost will be only one-fortieth that of gas. In the face of such definite assertions incredulity would seem to be a crime, and it would appear to be the duty of all Gas Directors to make forward contracts to deliver old iron in view of the immediate future when gas will be spoken of as a thing of the past. Curiosity, however, is such a persistent trait of the human mind that one cannot repress a desire to know the exact details of this all-trans-forming discovery and to form one's own opinion of the sources of its transcendent merits. Fortunately the veil of mystery that has so long hung over the doings of Mr. Edison's laboratory has at last been drawn aside, and we are in full possession of the magic secret. It does not sound very wonderful after all. There is nothing new in the lamp. It is an ordinary incandescent lamp with a slip of carbon as the substance to give forth the light. The sole secret is that Mr. Edison makes the carbon out of burnt paper.

The discovery bears strong marks of Mr. Edison's handiwork. Like all the other so-called discoveries of his in connexion with electric lighting (with one exception, of which we will speak presently), it is wholly without novelty, unless there be some unimportant details in the particular form of the connexions and regulating mechanism, in which he has chosen to exhibit that ingenuity which he undoubtedly possesses, but which could have been as well arranged in a thousand other ways. The idea of a lamp consisting of a piece of carbon placed in a vacuum and rendered incandescent by the passage through it of a strong galvanic current is at least as old as 1845, when it was patented by King, and similar devices have since been continually proposed and employed by others. Experience, however, taught inventors (as it will probably teach Mr. Edison when he has a little more acquaintance with the subject) that a vacuum is a very awkward thing to deal with, and that much more satisfactory results could be obtained by placing the carbon in a non-combustible gas, such as nitrogen or carbonic acid. Accordingly recent lamps in which incandescent carbon has been used have generally been of that type. Such was the Sawyer and Mann lamp which excited so much attention in New York some twelve months ago, and which consisted of a thin rod of carbon in a receiver full of nitrogen. Of late we have heard nothing of this lamp, and we very much fear that it is another instance of the fatal gulf between theory and practice, and that its disappearance from public view is due to the existence of some practical difficulties in the application of what seemed to be an ingenious idea. Other lamps are upon similar principles; the most successful one, so far as we can judge by report, is a French one, in which there are three small carbon rods in a closed receiver, the oxygen of which is consumed by the combustion of one of the rods, leaving the atmosphere in the receiver incombustible during the incandescence of the other two. Nor is there any more originality in the idea of procuring the carbon for such lamps from burnt paper or cardboard. That such carbon was very suitable for producing light by incandescence has long been known to electricians. Mr. Swan used it fifteen years ago for an electric lamp on the incandescent principle, and, curiously enough, used it in the shape of a horseshoe, exactly as Mr. Edison is now using it; so that there

must be something more than a resemblance between the two lamps, seeing that the carbon and the enclosing glass vessel (which may be of any shape) constitute the whole of the lamp proper. The use of this carbon was given up because of its want of durability—a difficulty which, however, Mr. Swan says that he has now got over; and it seems to be tolerably evident from Mr. Edison's own account that he has done little or nothing to remedy this defect, of which he is probably not fully aware. At any rate, it is clear that the carbons he uses are fragile in the extreme, for he says that they must be taken out of the mould with the greatest care, to prevent their falling to pieces.

The general result, therefore, is that Mr. Edison leaves the subject of the electric light precisely where he found it, so far as discovery is concerned. He has added nothing to our knowledge. The next thing to consider is, whether or not his lamp performs the practical service claimed; whether, in short, the method he adopts—by whomsoever invented—will in fact accomplish what is alleged of it. Considered in themselves, there can be no doubt that the tales that have come over to us about Mr. Edison's new discovery are in the highest degree improbable. The use of incandescence as a means of procuring light from electricity, without breaking the continuity of the circuit, has been known from nearly the beginning of the century, and all its advantages and disadvantages have been thoroughly studied. The result has always been to show that it is a very wasteful method of using the electric current when compared with the electric arc or the broken circuits of such lamps as the Regnier and Werdermann, which hold an intermediate position between the two classes. It possesses great advantages, which are obvious at first sight; but so great is the disadvantage of which we have spoken, that its use has been very limited, except for special purposes, as, for example, the little medical lamps for illuminating the cavities of the body to facilitate diagnosis. That this principle should turn out to be the enormous commercial success that Mr. Edison's lamp is represented to be, is in the highest degree unlikely, seeing that, as we have said, his lamp differs but slightly, if at all, from lamps previously known. Nor do the accounts themselves that have reached us tend to reassure us much. They show clearly that this lamp is more fragile and more difficult to handle than any of its compeers. They do not give us the least reason to think that it has any elements of success in it other than the bright character of the incandescence of carbon made from paper; and as such carbon cannot materially differ in its qualities from other kinds, and is even more liable to be heterogeneous and uncertain, this small advantage seems to be a very slight matter to build such high hopes upon. They do not suggest any way of getting over the difficulty which is met with in lamps constructed on this principle, of keeping the glass from getting dulled by particles of carbon coming off from the incandescent mass within it—a difficulty which would be peculiarly fatal to a vacuum lamp like Mr. Edison's which cannot be cleaned on the inside. But, above all, there is a strong flavour of humbug about the whole matter. Every account—even those which Mr. Edison himself seems to have authorized—is written in a way in which no good electrician could write. We have a sensational account of the supposed discovery, where a thin filament of carbon is represented as having been accidentally tried with a strong current, and we are told, as of a newly discovered marvel of science, that this carbon filament resisted an intense heat, and "proved in reality more infusible than platinum." As though every schoolboy who has dabbled in chemistry did not already know that carbon was incomparably more infusible than platinum, or indeed than any other substance. Then there are references to other electrical phenomena which have about as much to do with the matter as the processes of electrotyping would have, but all of which are ingeniously identified with the so-called discovery, as though they specially belonged to Mr. Edison's lamp. Thus it is explained that the current can be made to run a sewing-machine; and other potentialities are vaguely shadowed forth which are said to be dependent on a knowledge of the laws of electricity. Of course a continuous current can be made to do work in a thousand different ways; but what have the marvels of electricity in general to do with the question whether Mr. Edison's lamp is a good one? Again, there is the new dynamo-electric machine. Mr. Edison must of course come before the public in a state of complete independence of all other inventors; so he must not even get his electricity from the same sources as others. Hence, for a second time, he produces a dynamo-electric machine, which he calls by the pompous title of the Faradaic Machine. It merits this title only in virtue of its representing a state of knowledge more nearly that of Faraday's time than any machine in use at present. It is strange how Mr. Edison's efforts in electric lighting seem cursed with a total absence of originality. This machine, both in its separate parts and its general arrangement, is the merest copy from other machines. Its principle, its arrangement, and everything about it are so utterly unoriginal, that, really it is difficult to understand how Mr. Edison himself can fancy he has any claim to be considered its inventor. It only differs from the machines at present in use in that it is much what they must have been in their early forms, before their makers had learnt how to intensify the magnetic field in which the armatures rotate. He drops hints of machines that utilize ninety per cent. of the power applied to them. The correctness of this figure, if it is intended to apply to this machine, we cannot believe in. Such a percentage is about what is expected from a good machine on the Siemen's Gramme or Brush principle, and it is simply absurd to suppose that this blundering imitation, which is destitute of all the special improvements which experience has suggested to their makers, can contend with these machines on equal terms.

All these circumstances and many others cause us to regard with utter distrust the glowing accounts of Mr. Edison's invention (if it is entitled to be called such) that reach us from New York. And added to this there is the remembrance of what happened some eighteen months ago at the beginning of Mr. Edison's experiments on the electric light. Every one recollects how, in October 1878, there came a telegram from New York that Mr. Edison had completely solved the problem of electric lighting, and how this telegram caused a tremendous panic in gas shares, sending them down to two-thirds of their previous value. Even the instructed who could detect in the very language in which the telegram was couched evidence that it was framed either by or for persons who were ignorant of the subject, scarcely dared to imagine that such a telegram could have been allowed to go forth or to remain uncontradicted unless Mr. Edison had really obtained most important results, and was in a position to effect practically electric lighting at a reasonable cost. It is fortunate for Mr. Edison that public attention cannot remain very long fixed upon any one subject, and that by the time that a few months had elapsed people had ceased to think of him or his telegram. For we now know in what position he stood when that outrageous telegram was sent. And it is well that we are able to arrive at this from sources directly connected with Mr. Edison himself, for it would otherwise be impossible to convince any one of the true state of the case. Some six or eight months after this telegram two patents, representing the latest completed results which even then Mr. Edison had obtained, came over to this country, and were made public amidst the universal derision of all who knew anything about electricity. The wonderful secret that was to solve completely the problem of electric lighting was the use of incandescent platinum (or an alloy of platinum and iridium, we forget which) to give light. It would seem that Mr. Edison has an irresistible passion for electrical antiquities. Not only is this one of the very oldest devices known, but it was actually patented in 1848 by Staite, though we doubt whether such a principle could even then have been the subject of a valid patent unless there had been something special in the form in which it was applied. We forget whether Mr. Edison attempted to patent his lamp, or even if he had any lamp at all at the time; but he certainly patented a regulator, which was intended to turn off the current when the heat of the platinum got too intense. This was a simple instrument of little or no merit and deserving of no notice. We really do not know whether it was able to do its work; we have heard that it failed even to do that; but whether or not this was the case is of no moment, for, so far as we have been able to learn, both the lamp and the regulator have, for all practical purposes, proved abortive. We have never heard of their being tried on any practical scale, or even of their being used at all outside of Menlo Park; and whatever may be Mr. Edison's love of perfection, we do not believe for an instant that, if he had got a really practical lamp capable of doing a fraction of what that was represented to do, he would have let months pass without its coming into the market.

But these two were not the only precious gifts which were then bestowed on the world by Mr. Edison. There was a third, to which no disparaging remarks as to its extreme simplicity could be applied. The second patent then taken out by him was for a wonderful dynamo-electric machine of a wholly new construction. We willingly give Mr. Edison credit for originality in this machine. Coils were fixed to the vibrating arms of a monstrous tuning-fork more than a yard long, and these, by the vibrations of the fork, were made to approach or recede from magnets, and thus currents were generated. If it were not actually in a patent taken out on Mr. Edison's behalf, all instructed persons would hesitate to believe that such an absurd arrangement could be seriously proposed at a time when such machines as the Gramme, the Siemen's, the Lontin, the Brush, and a host of others were in existence, much less that it could be proposed by a man of Mr. Edison's advantages and fame. It is difficult adequately to express the ludicrous inefficiency of the arrangement; but one thing is abundantly certain, and that is that the person who seriously proposed it was wholly destitute of a scientific knowledge of either electricity or the science of energy. It is clear that he was tempted by the hope of getting out of the vibrations of the tuning-forks something more than the force he expended on them. No doubt he thought that vibration was so confirmed a habit with tuning-forks that they would vibrate on the merest hint being given to them. To those who remember the amusement that this wonderful invention excited among English electricians, it will be interesting to read the following passage from the latest authentic American account:—"Mr. Edison's first experiment in machines for generating the electric current did not meet with success. His primal apparatus was in the form of a large tuning-fork, constructed in such a way that its ends vibrated with great rapidity before the poles of a large magnet. These vibrations could be produced with comparatively little power. *Several weeks of practice* proved, however, that the machine was not practicable, and it was laid aside." We should very much like to know when these weeks of practice (not a very long trial for a new invention) took place. Not before the patenting, or it would never have been patented. Then it must have

been after the patent was taken out—a matter which confirms the opinion held by most persons in England who were competent to judge of it, that no such machine had at the time ever been made (except, perhaps, on a small scale), and that the whole matter was a pure speculative suggestion. Remembering the unrivalled opportunities for experiment possessed by Mr. Edison, the fact that he took out this patent without any adequate preliminary trial—and we are convinced that a most superficial investigation would have demonstrated its worthlessness—is a striking lesson as to the reliance that must be placed on the accounts of the extent of the preliminary experiments to which his so-called inventions are subjected. We can assure Mr. Edison that it will require a long list of successes, not only announced, but realized, to counteract in the minds of those capable of judging of it the effect of that absurd patent in convicting Mr. Edison of being a man with no scientific knowledge of electricity, and either so incapable of judging of the value of his work or so careless of his own reputation as to be ready to patent a machine which on a few weeks' trial proves itself, on his own confession, to be an utterly worthless device.

These petty results, or rather the small fraction of them that he had obtained six months previously to their publication, represent all that Mr. Edison had actually completed when the famous telegram was sent. In other words, he had not the slightest ground for announcing that he had made any substantial advance in the treatment of the electric light, much less that he had completely solved its difficulties. Now we do not suppose for a moment that Mr. Edison would aid in giving currency to a report which he did not believe to be true. The most probable hypothesis is that he is an inventor who is absolutely intoxicated with his own reputation, and who has an unlimited belief not only in the efficiency but also in the novelty of all that he proposes. In no other way is his conduct comprehensible. The exciting cause of the celebrated telegram could not have amounted to more than that, having thought a little over the difficulties of the rival plans for producing the electric light, he resolved to concentrate his efforts upon the oldest and the easiest—namely, incandescence in the continuous circuit. Having resolved in his own mind that this was the best form, his vanity treated success as so certain that we honestly believe he viewed it as a grand new departure in electricity, whereas it was only what hundreds had done before and hundreds will do again. Then he went on floundering through all that his predecessors had gone through before him; advancing knowledge not one whit, inasmuch as all his results were old, but still pressing on with the profoundest conviction that everything that came upon him as a novelty was new also to the world. It is only by keeping these things in mind that we can judge of the value of the recent reports of his successes, and we can come to no other conclusion about them than that without independent confirmation they are not worthy of credence. It is not that we do not think that Mr. Edison is likely to help in the development of electric lighting. On the contrary, considering his unexampled advantages, it is matter for surprise that so ingenious a man has not discovered something worthy of remark by this time. For he is undoubtedly an inventor of exceptional merit. Independently of the important share he has had in the development of quadruplex telegraphy, his success in the carbon and loud-speaking telephones shows that he is possessed of great inventive power and remarkable mechanical ingenuity. His other great achievement, the phonograph, would alone go a long way towards justifying his enormous reputation. But these successes seem to have completely turned his head. He allows the wildest reports of his doings to obtain currency. The same account to which we have referred speaks of his having recently invented an air-pump, a method of utilizing mining tailings, a sextuple telegraph, and a specific against headaches. This last child of his fertile brain is old enough to be christened, and rejoices in the mysterious name of Polyform, and the reporter goes so far as to state that Mr. Edison takes it himself. But this must surely be an exaggeration. Altogether he reminds us forcibly of the White Knight in *Through the Looking-glass*, and we expect soon to hear that he has

> Completed his design
> To save the Menai Bridge from rust
> By boiling it in wine.

It will be remembered that the White Knight also had invented devices for the preservation of his health. All these things make us feel that Mr. Edison is not capable of judging of his own performances, and confirm us in the belief that his latest idea is but a doubtful rival of many lamps that are already in the market. The calculation as to its costing one-fortieth the price of gas is an utterly absurd one, even when read by the light of the meagre details on which it professes to be based. The most economical form of electric light is, and in all probability always will be, the arc-lamp, where it can be used on a large scale, and no form of incandescent lamp can approach it in economy of production. Yet engineers are very well satisfied if they can bring down its cost, even under the most favourable circumstances, to between two-fifths and one-fourth the price of gas. We feel tolerably certain that the cost of Mr. Edison's lamp, even if it is otherwise practicable (about which we have a good deal of doubt), will be many times this. The only good point about the news is that Mr. Edison seems at last to have settled down to the useful detail work of trying various methods of improving the manufacture of carbon for electric purposes. This is much wanted, and Mr. Edison is exactly in a position to do it. But, supposing that a manufacturer of artificial carbons were to discover that it was better to use barley-meal than wheat-flour, or lump sugar than moist sugar, in their preparation, we should be considerably surprised to find him announcing himself to the world by telegram as being the greatest inventor of the age. In our opinion Mr. Edison's pretentious announcements are as little justified by the fact that he has satisfied himself as to what is the best form of carbon to use in the ordinary and well-known incandescent method of electric lighting as a candle manufacturer would be justified in announcing that he had completely solved the problem of domestic lighting because he had devised a slightly improved candle-wick.

ENGLISH SOCIETY AT HOME.

A RECENT novelist has somewhere complained that life does not appear to her to be as jolly in 1880 as it was in 1866. Probably there were a good many people in 1866 to whom it appeared that life then was not as jolly as in 1852, and the process might also in all probability be continued backward to the year 14 of the world. At the same time it must be confessed that a superficial student of the handsome album in which some of Mr. Du Maurier's *Punch* drawings have just been reissued might go away with the idea that the England of to-day, at least the English society of to-day, was passing through a phase of suppressed vitality. Mr. Du Maurier comes, and comes not unworthily, at the end of a long list of pictorial satirists which begins, at least for most people, with Hogarth, and continues through Bunbury and Gillray and Rowlandson, and many others, down to Leech. The satirist of this kind, by the mere fact of being popular, may be taken to hold up the glass pretty firmly to nature, though often he may, and generally does, put a good deal of his own into the picture which he draws. People will not as a rule laugh at anything which is obviously and widely removed from actual fact. When we find in the social caricatures of any period a predominance of eating and drinking, we may be pretty sure that the ways of the time were not remarkable for temperance in those respects; and certain very famous sets of Hogarth's could hardly have been produced at a time when the observance of a high standard of decorum was thought necessary. So, if there be found in this album of Mr. Du Maurier's a predominance of professional beauties, chamber-music, and Mrs. Ponsonby de Tompkyns, future generations will hardly be wrong in concluding that Mrs. Ponsonby de Tompkyns, chamber-music, and professional beauties had some actual prominence in the actual world of the forty-second year of Victoria.

Perhaps Mr. Du Maurier's nearest approach to an individual creation is this same Mrs. Ponsonby de Tompkyns. She has other names, but the one form is sufficiently apparent through them. In these days of examinations and of the scientific treatment of things in general, we can conceive few better subjects for young ladies to write essays on than the origin, history, and character of Mrs. Ponsonby de Tompkyns. Forty years ago Mr. Du Maurier's clever sketches would assuredly have illustrated what they used to call in the France of Louis Philippe a "physiology" of her. She is distinguished strikingly enough from her predecessor, the Lady de Mogyns whom Thackeray has made immortal. Mrs. Ponsonby de Tompkyns is young, she is decidedly pretty, she is not unladylike in a way, and she is well provided with this world's goods. Sometimes, indeed, Mr. Du Maurier gives the reins to his imagination, and places her in marble halls which would have satisfied even Poe in the mood wherein he wrote *The Domain of Arnheim*. Mr. Ponsonby de Tompkyns is not young, and he is certainly not pretty, but his exterior is passable, and he is obviously not the *nouveau riche* of the last generation who made his money in tallow or hooks and eyes. The essayists for whom we have suggested a subject may have some trouble in placing the original social condition of the pair. At the time of their appearance, however, they are distinguished chiefly by the desire to shine. The Lady de Mogyns and Lady Claverings of the past—of all pasts—had this desire too, but their only notion of bringing it about was by the clumsy process of being "took up." The aristocratic personage who took them up at first invited their guests for them, and then sometimes ended by not being invited herself. This process is not exactly obsolete, but Mrs. Ponsonby de Tompkyns is above it. She "fishes with all nets," like Mr. Dobson's more unsophisticated heroine. The gifted people are asked to meet the duchesses, the duchesses to hear and see the gifted people. In her early days she may make some unfortunate blunders, or, at least as Thackeray would perhaps have called them, "blunderkins." Mr. Du Maurier depicts for us members of her class who appear to confound the effective but arbitrary monogram of commerce with the devices which are, or ought to be, allotted and sanctioned only by the Heralds' College; others who are at sea as to the meanings of the term "creation," and so forth. But Mrs. Ponsonby de Tompkyns soon emerges from this stage. She is either a beauty herself, or takes care to introduce beauties as bait into her drawing-rooms. She is constantly—indeed too constantly—presenting Professor Brown and Professor Parallax to the affable Duchess; and the marble halls and the best cook in London do the rest. Her "note," as some of her guests would put it, is that she shows the old weakness of the lion-hunters of past ages in a new form. The noble animals are hunted, not so much for their individual merits as

because each attracts others into the net. Meanwhile, Mr. Ponsonby de Tompkyns, patient, obedient, and a good deal bored, executes his wife's behests, and is content to shine with ever so little of reflected light.

As Mrs. Ponsonby de Tompkyns is Mr. Du Maurier's principal figure, so is music his chief theme. For some reason or other (which we shall leave those who are always asserting that Englishmen are a great musical race, somehow defrauded of their birthright, to explain), the divine art of music has always had a good deal to suffer in our country at the hands of the other divine art of comic design. It is difficult to look at the "Enraged Musician" without suspecting that Hogarth sympathized much more with the disturbers than with the disturbed; and the music-mania of the toilet scene in the "Marriage à la Mode" is something more than dramatically satirical. Rowlandson, too, has somewhere a malicious picture of "Music at Home," where an energetic lady is performing on a harp, with a guitar at her feet and a harpsichord open behind her, to a husband who is comfortably snoring. But few people have been happier than Mr. Du Maurier himself in hitting off the exaggerations and crazes of the musical taste. The prevalence of that taste, as we have noted, is one of the most effective instruments in the hands of Mrs. Ponsonby de Tompkyns. The professors, chiefly German, who "must always veep" when they hear the exceeding sweetness of their own music, and who are only too willing to indulge the company with another "little ting" of theirs after having previously indulged them in a dozen little tings, are admirable. So are the amateurs whose conceit and capacity are indifferently played upon by ingenious hostesses. So is the cat whose soul is moved to its depths by the tenor's agonized appeal to his love to "m-e-e-e-et" him. But in these music pieces the audiences deserve at least equal attention and commendation. There is endless variety in them. The other musical persons, decently attentive but slightly critical, not to say scornful, and waiting anxiously for their own turn to come, the enthusiastic young ladies, and the young men who would be enthusiastic if they were not too limp, and who prostrate themselves on the piano in a way which we fear must injure its tone, are all pleasing. There is one young man in particular who appears often, and the length of whose body is appalling and very cleverly saved from being impossible. These are the more private and solemn meetings for celebration of the cult, meetings where the audience are silent, abstracted, ecstatic, and sometimes almost in the condition of that other audience or company which the Laureate once described in the *Vision of Sin*. But there are also other and larger audiences to whom music is but one of many occupations, and where the voice of the talker decidedly prevails over that of the singer. Once, too, whether by way of concession to music, or by way of lodging another arrow in the side of the professional beauty, the artist gives us a scene in which the latter, to her intense disgust and surprise, is deserted by a whole roomful of men, who flock round a very sensible and quiet-looking songstress who is evidently neither mad about music nor about anything else.

Mr. Du Maurier's collection, being limited to "Society at Home," is perhaps not quite so miscellaneous as such collections have sometimes been. The artist rarely goes far from the reception rooms of some great house. But into these he manages to compress a vast amount of life—all, to return to our starting-point, rather solemn life, and life which seems to be a good deal bored with itself. His girls—unless he intends them to be ugly—are always beautiful; but it is rather a stately, not to say a forbidding, style of beauty. A great critic of womanly excellencies once included "touch-me-not-ishness" among them, and Mr. Du Maurier's young ladies have this in the highest degree. Indeed their dressmakers have so arranged them that they are very artful structures, in the highest degree beautiful to look at, but scarcely intended to be touched. The artist, however, is more merciful to them than he is to their brothers. The young men who crowd the staircases and line the walls of his well-filled interiors are almost more beautiful and artful than their sisters; but they are also much more foolish. Very rarely do they say anything, and when they do it is sure to be something absurd. Their coats are worthy to rank with that other and immortal article of male attire into which the Count D'Artois was daily dropped by two strong valets; the droop of their eyeglasses is a sight to see, and the curve of their waistcoats a thing to aim at, but not to reach. Arranged like a kind of irregular dado along the walls, they outshine the pictures and the plates behind their heads in elaborate arrangement. We are given to understand that they sometimes write books instead of reading them; they have sufficient business capacity to speculate on the profits of hiring themselves out to dance at so much a night, and they can, as we have seen, sometimes fall into trances of limp enthusiasm for music, and china, and pictures; but their faculty of repartee is singularly limited, and the highly artificial beauties whom their dressmakers will not allow to sit down have much the better of them in this respect. Space would fail us to tell of Mr. Du Maurier's bishops, in whom he has ably developed some hints given by his predecessors; of his duchesses, who are also able developments, sometimes "oldened" a little, of that admirable figure of Lady Lufton which used to appear in the *Cornhill* twenty years ago; of his fat old men and his thin old men, and many other pleasing types. It is, perhaps, as a general rule, easier to laugh at than with most of his people; and, indeed, we are expected to do so. Every now and then there are touches which are not specially of this age, such as the "Feline Amenities" which two charming matrons are exchanging *àpropos* of a beautiful major, the longing of the wearied couple in the "Waning Honeymoon" for the turning up of some friend, or even some enemy, and so forth. "Sir Wobert," who amiably expresses himself as "so awwy," when he is informed at an agricultural show that Lady Wachel and Lady Fwedewica have "gone to the dogs," is also not of an age, but of all time. But for the most part the subjects are drawn from classes which, as an enraged poet once said of somebody he did not like, are "coldblooded products of a late and transient phase of Anglo-Saxon civilisation." In this instance the product was, we believe, a reviewer; in Mr. Du Maurier's it is no single type, but consists of young men and maidens, old men and matrons, who are either desperately interested about things not much worth interesting oneself about, or who take very little interest in anything, except the way to come up as a flower and be beautiful. Caricature of course exaggerates —it would not be good caricature if it did not. But it does not invent; and most people, except recluses, will recognise at least some originals, or some who might have been originals, of M. Du Maurier's pictures. The art which he professes has left off scourging vice, and confined itself to folly. Perhaps that is because there are no vices left to scourge.

PROPOSED CANONIZATION OF ENGLISH MARTYRS.

A PETITION has just found its way into the papers, presented to the Pope by "the Catholic Union of Great Britain," of which the Duke of Norfolk is president, praying for "the canonization of the English Martyrs" who suffered under Henry VIII. and Elizabeth. Three reasons are given for making this request. In the first place, the petitioners dwell on the heroic courage of "that noble host" whose leaders were Cardinal Fisher and Sir Thomas More, and which is closed by Archbishop Plunket of Dublin. They add that the sufferers "adorned their life with every shining virtue, and patiently endured every trial, which ennobled the saints of our country before the schism." A second —and we suspect stronger—motive is found in the number of persons who have of late years "given up the errors of the Protestant sects in which they had been educated, and especially the errors of the Church of England, and have embraced the Catholic faith," whose conversion must reasonably be attributed to the blood of these martyrs. Last, but not least, comes the third reason, that "these champions of the Christian faith" died not simply for Catholicism, but expressly for the Papacy. "There is not one among them who did not sacrifice his life for *the honour of the Apostle Peter* and *the rights of the Holy Apostolic See*"; the Pope is reminded that they are his "own witnesses," and hence it is "equitable that they should receive their crown from Him (*sic*) for whom their passion specially witnessed." It is obvious at a glance that these reasons are given on an ascending scale, when we remember from what quarter the document emanates. The Catholic Union is the stronghold of Ultramontanism, and, though a lay body, is well known to be inspired by the Ultramontane head of the Anglo-Roman Church. The steadfast courage and "shining virtues" of the martyrs—which are freely admitted on all sides, at least as regards a great many of them—are of course put first as the formal plea for canonization. But the real motive is first to throw down the gauntlet to "the Protestant sects, and especially the Church of England"; secondly, and above all, to glorify "the jurisdiction of the supreme Pontiff," which was the one point of faith or policy—we will explain the distinction presently—for which they were put to death. There is something in this appeal to the equity or self-interest of the Pope which rather oddly reminds one of Satan's appeal to St. Michael and St. Peter in Byron's *Vision of Judgment* for the damnation of George III., because, although he worshipped God himself, he persecuted the Irish Catholics, who desired to worship "not alone your Lord, Michael, but you, and you, St. Peter." Or, to take a more historical parallel, it is very like the plea openly and strenuously urged by Italian divines for the definition of the Immaculate Conception, that it would engage the Blessed Virgin by a fresh obligation to defend the States of the Church. What response Pius IX. would have made to such an appeal there can be little doubt. How his successor may receive it is another matter. That a man of his tact and breadth of view will not be eager to forward so questionable a design may readily be conjectured, but whether he will feel equal to resisting the pressure which is sure to be brought to bear upon him is not equally clear. Our present concern however is not with the fate of the proposal of the Catholic Union, but with the proposal itself. That anything we can say will affect the judgment of that august body is not to be supposed, but it may be worth while to point out to more dispassionate observers the real scope and tendency of their singularly indiscreet request.

We have said already, and we gladly repeat it, that there is no difference of opinion among reasonable men of whatever creed as to the honour due to those Roman Catholic martyrs who bravely and patiently suffered for conscience sake under the sanguinary code of Henry and Elizabeth. It is true indeed that, for reasons intelligible enough but not always creditable, there was once a general disposition among Englishmen—which their coreligionists, if they are wise, will not be solicitous to revive— to disparage or deny their merits. But during late years many signs have appeared of the prevalence of a juster and more generous spirit among us. It is shown not only in the kindly reception accorded some years ago to the excellent *Life of*

Campion by a learned and liberal-minded Roman Catholic, and more recently to the *Records of the English Province of the Society of Jesus* now in course of publication by the Jesuit fathers, but still more clearly by such publications as *One Generation of a Norfolk House* by Dr. Jessop, Head Master of the Norwich Grammar School, and an article on "the Jesuit Martyrs, Campion and Walpole," which appeared the year before last in the *Edinburgh Review* and was noticed at the time in our columns. And a simultaneous disposition has grown up—springing at once from a sounder criticism and wider religious sympathy—to refrain from the angry declamation formerly so popular about "Bloody Mary" and the fires of Smithfield. It is true that the old bitterness lingers on in certain quarters still. We had occasion some years ago to denounce the issue of a Sunday-school edition of Foxe's lying "martyrology," in the form of a twopenny catechism, under the auspices of an Evangelical prelate now deceased. But the general tendency has been all the other way. It has been recognized, to quote the words of the *Edinburgh Reviewer*, that "a man who lays down his life for what he holds to be the truth deserves all admiration and respect, whether he is a Cameronian on the wild moors of Galloway, or a Jesuit on the gallows at Tyburn." Roman Catholic writers like Lingard or Montalembert did not hesitate on their side to apply this principle fairly all round, and Charles Butler expressed what would now be a very general feeling when he said, "Let Protestants cease to reproach the Roman Catholics with Mary's fires, and Roman Catholics shall be equally silent on the sanguinary code of Elizabeth, and the executions under it." It is this *entente cordiale* which the Catholic Union are doing their best to break up. They are going out of their way to challenge attention to the weak points in their own case, as regards both persecution and martyrdom. Let us say a word on each point.

We shall hardly be suspected of a desire to rehabilitate Foxe and canonize his motley crew of heroes, existent or non-existent. It may be freely admitted that of those who are not fabulous some were very poor creatures, while many of their leaders—including notably Cranmer, who may be left to the tender mercies of Macaulay—had fully earned capital punishment by overt acts of treason. It must also be remembered—and it is an argument which cuts both ways—that the forcible repression of heresy, as such, was a principle of duty universally recognized and acted upon in that day, not least certainly by those who fell victims to it under Mary. But still, after making full allowance for such considerations, it remains true that the ghastly spectacles witnessed during the later years of her reign, when some three hundred men and women were burnt to death as heretics, left an impression on the national mind which three centuries have not effaced. "Hundreds of thousands of Protestant writings," to quote Dr. Döllinger's words, "scattered over the length and breadth of the land, could not have done so much to strengthen the Protestant cause as the spectacle of the fires of Smithfield." When Mary came to the throne the mass of the nation, if not fervently Papal was fervently Roman Catholic. On her death the revulsion was so strong that, in spite of a powerful Catholic party, her successor had no difficulty in carrying the great body of the people with her in a policy distinctly Protestant. Edward VI. could hardly enforce a moderate Anglicanism at the sword's point; Elizabeth's chief trouble was in curbing Puritan excess. Such facts as these tell their own tale. It may not be desirable in the interests of religious peace that they should be dwelt upon, but if the Elizabethan martyrs are to be lauded to the skies and held up to the veneration of the faithful, we may be sure—human nature being what it is—that Protestants will not allow the memory of their Marian fellow-sufferers to die out. Already, we believe, two churches have been opened in the East of London during the last few years, Roman Catholic and Anglican respectively, in memory of the rival "English martyrs." And the first result of the proposed canonization would be to rekindle the smouldering ashes of religious bigotry and discord. The faggots of Smithfield and the gibbets of Tyburn will prove equally available instruments to conjure with. Those who prefer Christian charity to sectarian rancour may naturally prefer that both should be forgotten.

Nor is this all. The canonization of the English martyrs from More to Plunket will inevitably provoke a critical examination of their claims to the new cult. Many, perhaps most of them, may bear the personal scrutiny, and there are few indeed who are not more respectable candidates for the aureole than the fierce inquisitor, St. Peter Arbues, who was the other day "raised" by Pius IX. "over the altars of the Church." But a further question, as regards the Elizabethan victims, will at once force itself on public attention—or rather two questions. For what cause precisely did they die, and who was mainly responsible for their death? The Catholic Union is careful to remind us that they sacrificed their lives chiefly, if not exclusively, "for the honour of the Apostle Peter," that is, for the extremest claims of the Papacy. And here a distinction at once suggests itself. Some of these missionaries, like Campion, devoted themselves entirely to religious labours for the conversion of their countrymen; others, like Parsons, were notoriously implicated in the political conspiracies favoured by the Court of Rome. Yet Campion and Parsons would of course both be canonized. And even Campion, though he personally disbelieved in the deposing power and publicly acknowledged Elizabeth for his lawful Queen, felt unable or unwilling to save his life like his fellow Jesuit Bosgrave by repudiating the validity of the Bull of Pius V. He died therefore for a point of Roman policy, not of even Roman faith. It must further be remembered, not in justification of the atrocious cruelties practised by the Government, but in explanation of their reasonable alarm, that the doctrine of tyrannicide had been worked up into a system by Jesuit divines, which was afterwards acted upon, not without high ecclesiastical sanction, in France. And Roman Catholic writers have shown the complicity of the Court of Rome in plots for the assassination of Elizabeth. To confine ourselves to public acts, as recorded by a candid but zealous champion of the Papacy in a recent work on *England and the Holy See*, we find that at the very time Pius IV. was writing a conciliatory letter to Elizabeth two years after her accession, the Court of Rome was actively fomenting rebellion against her in Ireland. Ten years later came the excommunicating and deposing Bull of Pius V., which he sternly refused to recall at the urgent request of the Emperor Maximilian. Ten years later again, Gregory XIII., one of the ablest and most enlightened Pontiffs of the century, issued another Bull, "exhorting, requiring, and urging" the Irish to rebel; and declaring war against the English heretics to be no less meritorious than war against the Turks for the recovery of the Holy Land. And meanwhile English Catholics were strictly forbidden to take any oath of allegiance to the Queen. We are far from saying that these facts excuse the tortures and executions which few Protestants of our own day would hesitate to condemn. But we do say, with the Roman Catholic writer just referred to—the italics are his own—"When Campion and other Jesuit priests came into England *declaring that they only did so to save souls*, is it to be wondered that Elizabeth disbelieved them? Again, what a curious display of policy was it not to send those poor *innocent* priests [qy. were *all* innocent?] into England at the very moment *when a Papally-guided invasion of Ireland was actually taking place?*" One thing, at all events, seems clear enough, that the main responsibility for the blood of "the English martyrs" under Elizabeth rests, not with the Queen but with "the Apostle Peter"—*i. e.* the reigning Pope, who instructed them and almost compelled her to identify "faith with faction and religion with rebellion." Leo XIII. is asked to build the sepulchres of the prophets whom his predecessors slew. We have glided half unconsciously into the language of the "Gunpowder Treason" service, only expunged within recent memory from the English Prayer-Book in a spirit the reverse of that which prompts the proposed introduction of fresh controversial amenities into the ritual of Rome.

One word may be added in conclusion on another point, of some interest at least to our Roman Catholic readers. What is precisely the meaning and force of canonization? Veron, in his *Rule of Faith*, translated by the Jesuit Father Waterworth, insists that no infallible authority can be claimed for the act, and that Catholics are in no wise bound to believe in the sanctity, or even the existence, of the personages they are called upon to invoke. "Neither a Pope nor even a General Council is guided infallibly in the canonization of a Saint," inasmuch as "all Catholics are agreed that the Pope even in a General Council may err on matters of fact." And there is no revealed evidence to prove that these persons (with the exception of those named in Scripture) were Saints, or that they ever existed, or that the miracles which are the chief cause of their canonization ever took place. Father Waterworth declares in his preface that "the authority of this treatise of Veron's is well known and universally acknowledged," and it was quoted by Archbishop Murray in his examination before a Committee of the House of Commons as a work in which "is found the most authentic exposition of the Catholic Church." On the other hand Cardinal Newman tells us, in the preface to his *Via Media*, that "the infallibility of the Church *must certainly extend* to this solemn and public act; and that because, on so serious a matter, affecting the worship of the faithful, though relating to a fact, the Church (*that is the Pope*) must be infallible"; and he quotes Lambertini and Aquinas for his view. Who is right, Veron or Newman? There is much force *ex hypothesi* in the Cardinal's reasoning, but his conclusion has this inconvenience, that there are some canonized Saints whose sanctity it would be difficult to establish; some, like St. George, whose existence is doubtful, and others, like St. John Nepomuc, who certainly had no existence; and a great many miracles recorded in Bulls of Canonization and Breviary lessons which are allowed by all competent critics, albeit Roman Catholics, to be entirely unhistorical. We cannot say whether Mary Stuart is among the martyrs included in the beadroll of the Catholic Union, but her canonization has often been mooted, and we believe some preliminary stages of the process have actually been entered upon at Rome. We merely give her case as an illustration when we say that it might be a trial even to Cardinal Newman's faith to find the personal controversy so hotly debated between Mr. Hosack and Mr. Froude settled over their heads by the verdict of an infallible tribunal. Such questions will at once be forced to the surface if the Tyburn martyrs are canonized, and it may be doubted whether an increased reverence for them, or for "Him from whom they receive their crown," is likely to be the result.

DIAMONDS NEW AND OLD.

Among the smells for which the city of Glasgow is justly famous, and which certainly exceed in number and pungency the stenches of Cologne, one may, or lately might, be described as all-pervading. It is a singularly warm sweetish smell, which follows you everywhere, and which is particularly prevalent when

a west wind is blowing. In this smell, as in a pleasing and commodious environment, the other minor and local odours have their being. The natives say that the sweetish sickly stench accompanies some vapour which has the power of blackening silver, and this statement we can readily believe. The fragrance in question is scattered abroad, as out of a censer, from a mighty chimney, which, "like some tall bully, lifts its head, and" is offensive. This chimney belongs to the St. Rollox chemical works, and the smell, for all we know, may be that of diamonds in the making, for in St. Rollox Mr. MacTear has possibly succeeded in making artificial diamonds. Whether the result is quite worth the misery which the St. Rollox chimney inflicts, or at least used to inflict, on the human nose, is a question best settled by persons who live within a ten miles radius of Glasgow. It would be a great thing for the Glasgow "buddies" to claim for their town priority in this art: but greatness is not achieved without suffering, and the possibly "bastard diamonds," as Pliny calls them, have been won at much expense of noxious, or at least of nasty, vapours.

It does not yet seem to be certain whether Mr. MacTear has or has not produced artificial diamonds possessing all the qualities of the genuine article. If he has succeeded, he has certainly surprised one of the most hidden of Nature's secrets. We do not know in which of her laboratories, or by what long processes of distillation, she forms the glittering grains for which souls and kingdoms, and even the one lady of Sir Robert Walpole's acquaintance who "would not take gold," have been bartered. "Very sildome it is, and thought a miracle, to meet with a diamond in a veine of gold," says Phil Holland, translating Pliny, "and yet it seemeth as though it should grow nowhere but in gold." That was a curious philosophy, not quite extinct, which supposed itself able to guess where things should grow. In Balzac's novel, *La Recherche de l'Absolu*, the same theory survives. The hero is "trying to get the Absolute into a corner" by means of alchemy. He does not quite succeed with the Absolute; but, when all his means are exhausted, his crucibles cold, his furnace faded out, his friends find diamonds in the sediment of one of his alchemical messes. Diamonds really were found in gold, or at least in auriferous strata, by gold-diggers on the Mudgee, in Australia. In 1829 they were found in the gold washings on the European side of the Ural Mountains. Believers in the old "sympathetic" philosophy would have held that Nature was half consciously putting forth her noblest productive energies, and combining her choicest ingredients in these districts. The gold was comparatively her failure, the diamonds (people would have said) her success. And just as alchemists tried to distil out of gold, as the most perfect substance, the elixir of life, so they would naturally have tried to make diamonds out of gold. Not till early in the seventeenth century did people even guess that the diamond was an inflammable substance. "Neither was it known for a long time," says the old translator of Pliny, "what a Diamant was, unless it were by some kings and princes, and those but few." As to its combustible qualities, the ancient writer flatly denies them. "Wonderful and inenarrable is the hardness of a Diamant; besides, it hath a Nature to conquer the Furie of Fire; nay, you shall never make it hot, do what you can." Yet the members of the Academy of Florence "made it hot" for the diamond in 1694, in the presence of Cosmo III., and these experiments at high temperatures led to the discovery of the essential nature of the stone.

We cannot pretend, of course, to say whether Mr. MacTear has really supplied, at the St. Rollox works, an artificial *matrix* for diamonds in place of that natural one which has so long been vainly sought for in the world. The stones or dust which were sent to Mr. Nevil Story Maskelyne certainly did not satisfy that chemist, and stood none of the very interesting tests which he prepared. His description of these (published in the *Times*) was a most interesting example of the new method of "interrogating Nature," of cross-examining her, and putting her to the question. In Mr. Story Maskelyne's examination nothing was taken for granted. He stands at the very opposite pole to Pliny, with his old-fashioned way of expecting "sympathies and antipathies" in Nature to act much as they might in the world of men. "As touching the Concord and Discord that is between things naturall, in nothing in all the world may we observe both the one and the other more evidently than in the Diamant. For this invincible minerall, (against which neither Fire nor Steele, the two most violent and puissant creatures of Nature's making, have any power), is forced to yield the gauntlet, and give place unto the blood of a Goat, this only thing is the meanes to break it in sunder, howbeit care must be had that the Diamant be steeped therein while it is fresh drawn from the beast, before it be cold, and yet when you have done all the steeping you can, you must have many a blow at the Diamant with hammer upon the anvil . . . Certes, I must ascribe both this invention, and all such like, to the might and beneficence together of the divine powers." Yet the tests of Mr. Story Maskelyne, microscopic and scientific as they are, must yield for convincing force to those which Pliny would have applied to the St. Rollox article. He would, if logical, have given Mr. MacTear prussic acid, and then tried him with one of his own diamonds by way of antidote, much as the conduct of young ladies in Swift's vision was submitted to the arbitration of "the parish lions." If the girl was a good girl, all was well; if not, the lions devoured her. So, if Mr. MacTear's diamonds were genuine, they would possess "a property to frustrate the malicious effects of poyson"; while, if they were only paste, the "poyson" would have its malicious effect on Mr. MacTear. Pliny would also have tried the St. Rollox jewels in a lunatic asylum, for "the Diamant hath a virtue to drive away those imaginations that set folke beside themselves, and to expel vain fears that trouble and possess the mind." If the lunatics, on the exhibition of Mr. MacTear's jewels, continued as mad as ever, why the jewels were obviously shams. And herein doth Marbodæus, in his *Carmen de Gemmis*, agree with the learned Pliny, saying of the diamond,

> Et noctis Lemures, et somnia vana repellit,
> Atra venena fugat, rixas et jurgia sedat,
> Insanos curat, durosque reverberat hostes.

Here, then, are a number of tests to which we venture to say that no modern man of science has ever dreamed of subjecting the St. Rollox diamonds.

Mr. Story Maskelyne's first experiments went decidedly to prove that the new artificially-produced stones lack the essential qualities of the natural jewels. But on the sixth and seven of this month he worked for some hours with Mr. MacTear at the examination of that gentleman's productions. The result has been to convince Mr. Story Maskelyne that some of the substances submitted to him still require investigation. He believes that a portion of the material produced by Mr. MacTear is hard enough to have scratched topaz and sapphire. Certain experts also testify that they have been able to engrave two rubies, two sapphires, and other stones with the "crystallized carbon sand" from St. Rollox. And thus it seems very probable that, whether Mr. MacTear has produced diamonds or not, he has at least produced a crystalline form of carbon.

There does not seem at present much reason to fear that Mr. MacTear's discovery will act like those most uncomfortable inventions of Mr. Edison. That ingenious person might obviously, if he pleased, make a monstrous fortune. He has only to let it be known that he can light streets and houses, at infinitesimal cost, with carbonized potato-peelings or old cigar ends, and immediately gas shares go down like skittle-pins. Then, if Mr. Edison were an unscrupulous person, he could buy cart-loads of gas shares, and suddenly give out that the potato-peeling scheme proved a failure owing to the unavoidable presence of too much of the raw material of Hamburg sherry in the carbon. Gas shares would again go up like rockets, and Mr. Edison would retire with what even the countrymen of Tweed and Vanderbilt would think a handsome competence. These things, of course, are far from the mind of a just man, but they are not impossible. A great depreciation in the value of real diamonds, on the other hand, would only affect dealers, and members of "diamond-families," as the young ladies call them. The withers of most of us (who must take our chance against poison and insanity without "the stone called *anachites*") would be unwrung.

Ordinary diamonds, of course, would lose their value if Mr. MacTear could turn out carats by the cart-load. But amateurs would still value as relics the old historical stones. Negroes have used them in the rough as gambling counters; the gods of India have worn them in their eye-sockets; they have been swallowed by robbers and by faithful trustees in moments of danger. Kings' heads have fallen for the sake of the aigrette in the turban, and the diamond's beams have lit up every deed of lust and torture in the darkness. Some great diamonds were once probably parts of the same huge stone; and the cloven fragments may still be thought to long for each other, like the severed sister obelisks in the *Émaux et Camées*. The Koh-i-noor, which belonged thousands of years ago to a hero of the Mahabharata, and the Orloff jewel, were once, it is thought, parts of the same pre-eminent stone in the treasure of the Great Mogul. A third part, of 132 carats, fell from the crown of the ruler of the East into the hands of a peasant, and was used by him as a flint for striking a light. Mr. MacTear's diamonds, scientific articles as they are, cannot rival in interest the jewels of history.

EDUCATION OF THE SOLDIER.

Having in a recent article discussed the education of the officer, let us turn to that of the soldier. We are often reminded how unfavourably the soldier of the present compares in point of physique with the soldier of the past. Perhaps he does; but let us hope he can show a corresponding increase in intelligence. Not that the soldier of the past was necessarily wanting in that commodity, but he was never allowed to exercise or develop it. It is said that the ancient Spartans trained their soldiers during peace with such severity that war became, by comparison, a pleasant relaxation; and the training of the soldier of the Iron Duke's time appears to have been conducted on somewhat similar principles. It is indeed difficult for the present military generation to understand the rigour of the *régime* under which their ancestors lived. The barrack accommodation of those days was bad, the food worse, and the pay, reduced as it was by stoppages of every description, was in reality little more than half of the present rate. But these were slight hardships compared with the iron discipline and the excessive formality in minutiæ which characterized those days in the army. The importance which was attached to dress and equipment alone formed a fertile source of punishment; for inspections were so rigorous that it was almost impossible for even the most careful soldier to come up to the standard demanded, while any short-

comings were severely visited. In like manner the drill, limited as it then was to mere barrack-yard manœuvres, was of the most irksome and monotonous description. Its highest aim apparently was to exact absolute and simultaneous precision of movement from the battalion, and it might almost be described as consisting of one continuous "As you were." Nor was there in time of peace any relief to be obtained from the tedium and monotony of barrack life. Tattoo was sounded at an almost infantile hour; recreation-rooms, newspapers, and games were not yet in existence in any barrack; and the compulsory issue of pay daily, although the amount disbursed was frequently no more than one penny, rendered it impossible for the soldier to avail himself of any healthy or legitimate recreation. Altogether the soldier of the past was treated very much like a child; and when we read of the fearful scenes which occasionally followed some of the celebrated sieges in the Peninsular war, we should remember that they were in great measure due to the natural reaction consequent on such a training. Still, in common fairness, it must be admitted there was one thing which the soldier of the past could do—he could fight, and that, too, under circumstances which the present military generation would resent as almost insulting. No Special Correspondent followed him to the field to chronicle, not to say magnify, his deeds. No Victoria Cross incited him to acts of valour, nor did he need it. He spent whole years in campaigning and fighting without even the recognition of a medal. The most splendid feats of arms and the most decisive and important victories passed unnoticed—if not, indeed, unknown—and were accepted as a matter of course; in short, it may be said that military virtue was strictly its own reward, for no other was forthcoming. Those who disparage the soldier of the past and call him a mere machine should remember that, like most machines, he yielded implicit, unquestioning obedience to those who controlled him, and that he served his country well and faithfully because it was his duty.

Very different is the condition of the soldier of the present. In the first place, it must be observed that we have taken greater interest in him and have improved his social and moral status. It is to be feared that this increased interest is not wholly genuine; for plain truth compels us to admit that it was first aroused by our shortcomings in the Crimea, and has since been kept alive by occasional but frequently recurring failures of the supply of recruits. Hand in hand with these improvements came an immense advance in military science, demanding, even for the private soldier, increased military education. First of all came the introduction of the rifle, involving a special theoretical and practical training for every recruit, and an annual course, lasting about a fortnight, of drill, judging distance and target practice for the trained soldier. Then again we built gymnasiums at our principal military stations, and instituted gymnastic training, which includes a three months' course for every recruit, and an occasional course of similar duration for the trained soldier. Further, we have an occasional course of field-work, including the excavation of shelter trenches and siege parallels, and the construction of gabions, fascines, revetments, and bridges. In addition to all this, the attack formation has been added to the drill-book, and requires continual practice; while demands are made on the *personnel* of already attenuated regiments for parties to study musketry instruction at Hythe, cooking at Aldershot, and signalling. To the above list we may fairly add the autumn manœuvres, which, whether profitable or otherwise, absorb a considerable amount of time. Nor should it be forgotten that the regimental school has been established, and that every recruit is ordered to attend until he obtains a fourth-class certificate of education, and that trained soldiers are to be encouraged to attend until they are sufficiently advanced in reading, writing, and arithmetic. All these items form a very respectable list of the increased educational demands which advancing military science has made upon the time of the soldier of the present.

Now it so happened that about the period when these fresh demands had reached their fullest development attention was attracted to the extraordinary success just achieved by a certain Continental Power in a war of some seven weeks' duration. The said success was attributed to the short service and reserve system; and, although in this case the army was provided by conscription, although its duties were totally different from those of our army, and there was, in fact, nothing whatever in common between the two, it was considered that obviously the best thing we could do would be to copy the model provided for us. Accordingly we instituted short service with reserve, and the result has been that, while we have twice, or even four times, as much to teach the soldier, we have exactly half the time to do it in. We are aware that we have just seen the error of our ways, and have begun to return to long enlistment; but the change has been too recent to have taken any effect, and we are now, to all intents and purposes, still under the late system. The effect of this increased work and diminished time in which to do it has been that a considerable amount of what may be designated mere parade had to be thrown overboard, for the simple reason that neither men nor time wherewith to do it were available. To give our readers an idea of the extent to which our soldiers are now detached from the headquarters of their regiments, and are occupied with duties and instruction which but a few years ago had not even an existence, we may mention the following instance. A certain captain suggested to his commanding officer that the annual inspection was approaching, at which he, the captain, would be called upon to drill the battalion before the general, and that during the past six months he had had no opportunity of practising battalion drill. "No more have I," was the colonel's reply. Now it may be argued that when once a man has mastered mere drill he is a trained soldier; that constant repetition of it is therefore useless; and that the more he learns of other subjects the better. On the other hand, we would first remark that the very term "trained soldier" is fast becoming misunderstood. A man of ordinary intelligence can, in a year or so, pass recruit's drill, take his place in the ranks, and get through an hour or two of battalion drill without mistakes, but he is very far from being a trained soldier. A regiment composed of such men would be utterly wanting in cohesion, in steadiness, in discipline—in a word, in nearly every quality which trained soldiers should possess. Such a regiment might satisfy a civilian spectator at a review, but it would not pass muster with an old hand, and, as we have lately seen, it would on taking the field be liable to panic and confusion at one moment, however gallantly it might be fighting at the next. "Right or wrong, stand steady," was the motto of the drill-sergeant of the past, but now there is a perceptible change. If all goes well, the young soldier will stand steady enough; but if anything goes wrong, he is too apt to follow suit, and go wrong too. It is very well to sneer at incessant drill and parade work, but it has its use nevertheless, and that use is to keep men up to the mark. As an illustration of our meaning, we may mention that a short time ago we found the *Army and Navy Gazette* animadverting on the slovenly manner in which the soldiers of the Guards now perform their sentry duty in London. To the civilian eye the fault in question would not probably be apparent, but it has been repeatedly noticed of late by military men, and they know that slovenly performance of this duty in peace means still more slovenly performance of it in war, even in the presence of an enemy. And if this falling off has been remarked in the Guards, there is no reason to doubt its existence in the Line. Real discipline and steadiness are only to be obtained by keeping tactical units intact, and the men composing them under the eye of the responsible commander. It has always been admitted that the discipline in our navy is better than that in the army; and why? Because, when a ship has once started on a cruise, she maintains, with very few exceptions, her crew intact, and under the immediate control of the captain during the whole commission.

There is no disguising the fact that the incessant detaching of men from the control of their own commanding officers for instructional purposes of all kinds is playing havoc with the discipline of the army. Parties are sent away here and there to various schools of instruction, where the subject in hand forms the first consideration, and discipline only the second, if, indeed, it is not almost lost sight of. Worse than this, the best men and non-commissioned officers are frequently permanently transferred as instructors. The public are now so accustomed to the attenuated appearance of what are called regiments that they have ceased to notice it, and the falling off in discipline and smartness has escaped general remark, partly because it has been gradual, and partly because the Volunteers have unfortunately afforded a foil. We hope and believe that this subject will shortly receive official notice. We have only so far remarked the existence of what we fear to be a serious evil; on a future occasion we may suggest a remedy.

THE PRIORY OF MOUNT GRACE.

AMONG the most interesting but least known monastic remains in England is the little Carthusian priory of Mount Grace, seven miles east of Northallerton in Yorkshire. Lying only a field or two off the great North road, the grey tower of the little conventual church and the scattered gables of the cottage-cells of the brotherhood must have been noticed in former days by thousands as they dashed past on the top of the Northern mail, eager for the abundant meal to be eaten against time at the "Tontine Hotel." This establishment, with its huge walled quadrangle of stabling and coach-houses, as strong as a fortress—once so full of stir and bustle, but now as silent as the halls of Balclutha, save for the yelping of a discontented cur or the cackling of a self-asserting gander—bears witness to the mighty revolution which the present generation has witnessed. But, though once so familiar to travellers, a passing glimpse was all that most would care to bestow on the ruins; and even if one, more inquisitive than the rest, asked what they were, he would have to be satisfied with being told that it was "a place built by the old monks hundreds of years ago," and would pass on, utterly ignorant of the romantic tale of its chivalrous but ill-fated founder, and of the unique character of the ruins themselves.

And, strange to say, this ignorance to a great extent still continues. Many even of those to whom our monastic remains are a subject of special interest know little more of Mount Grace than the name—if even that. They would be as much surprised to learn that a Yorkshire valley, close to one of our chief high roads, would show them an almost perfect example of Carthusian arrangement; as some of those who recently visited Old Cleeve with the Archæological Institute were to find within a few miles of the busy town of Taunton a Cistercian abbey, with its domestic buildings, only needing their furniture and a little repair to be ready to receive the brotherhood once more. But in old days coach-passengers were always in too great a hurry to stop by the way; and since the steam-carriage has driven coaches off the road Mount Grace is certainly out of the world, and is only to be seen by those who make it the special object of a visit from Northallerton or Thirsk.

Such persons will certainly have no reason to regret their long, and not very attractive, drive.

The Carthusian Order was never very popular in England. From its first introduction by Henry II. in 1181, at Witham in Somersetshire, to the Dissolution, it only numbered nine monasteries. In fact, the extreme austerity of the Carthusian rule with its severe discipline of absolute silence and isolation, its meagre diet and coarse and insufficient clothing, was as alien from the comfort-loving English mind as it was unsuited to the English climate. Not even the powerful influence of St. Hugh of Lincoln, who, as Canon Perry has recorded in the interesting biography recently reviewed in our columns, was reluctantly torn from his beloved solitude at the "Grande Chartreuse," to preside over the Priory of Witham, could avail to render the order popular. It always existed as an exotic, and failed to naturalize itself here. More than three centuries elapsed between the foundation of Witham by Henry II. and that of Mount Grace by Thomas Duke of Surrey. Sir Walter Manny's celebrated London Charter House—the English form of the French *Chartreux*, as the Italian is *Certosa*—had preceded it by five-and-twenty years. Seventeen years later came Henry V.'s foundation of Shene. All three were brilliant anachronisms—in the age but not of it. In the words of the late Archdeacon Churton, who, in his splendidly illustrated *Monastic Ruins of Yorkshire*, was the first to direct attention to Mount Grace, they were "monuments of the bounteous hand of chivalry, in an age when the spirit of chivalry was departing, ... and the open faith of knighthood had given way to rancorous debate and civil treachery, soon to bear bitter fruit in the wars of the Houses of York and Lancaster." The noble founders of these houses were led to their selection of the rigid rule of St. Bruno by the evident decay of piety consequent on the relaxation of discipline in the older monasteries, which from houses of devotion had too often sunk into nests of State intriguers, while the indolent and self-indulgent lives of their inmates and their general carelessness as to the religious objects of their trust were fast growing into an intolerable scandal. The foundation of these austere "Charter-houses," whose "holy and singular observances"—to quote the words of the royal founder of Shene—"and the persons living in that order we not only love, but greatly honour and admire," was a noble protest against this growing secularism. But it was necessarily ineffectual. Within four years of the foundation of Mount Grace the Duke of Surrey perished in his gallant, but hopelessly rash, attempt to replace Richard II. on the throne, and the infant priory was all but strangled at its birth. The buildings were suspended, and the church and monastery remained roofless for forty years. But in 1440 Henry VI. confirmed all Surrey's grants, including that of Carisbrooke and two other alien priories, made to him by Richard II. at Haverfordwest on his way to Ireland, May 20, 1399, whence he was so soon to return to captivity and death, and the monastery was speedily completed. The suspension and resumption of the works is plainly traceable in the straight joints and altered style of the Priory Church and the other buildings.

The career of the ill-fated founder of Mount Grace opens one of the most romantic pages in the history of those unhappy times. The son of Thomas Holland, Earl of Kent, the half-brother of Richard II. by his mother Joan, his near kinship to the young King had been strengthened by congeniality of disposition, and he had grown into one of Richard's most intimate friends and most trusted counsellors. Honours were pressed upon him. In 1397, when the inevitable struggle between Richard and his uncle and guardian the Duke of Gloucester had reached its head, the young Earl of Kent, who had just succeeded to his father's title and estates, came forward as one of the leading appellants against Gloucester, as the treasonable author of the Commission of Regency, for which he was rewarded with the dukedom of Surrey, and soon afterwards was made Earl Marshal of England. In this capacity he presided at the famous lists of Coventry, immortalized by Shakspeare (2 *Henry IV.* iv. 1), when the desperate combat between Bolingbroke and the Duke of Norfolk, in which sport was becoming most bitter earnest, was, so fatally to himself, cut short by Richard's intervention:—

> O when the King did throw his warder down,
> His own life hung upon the staff he threw:
> Then threw he down himself.

Lesser marks of Royal favour were not wanting. A rich set of arras hangings embroidered with the story of Guy Earl of Warwick, which decorated the hall of Warwick Castle, within a short ride of Coventry, soon became his by the forfeiture of Thomas Beauchamp. The next year saw him setting out as Lieutenant of Ireland, at the head of twenty thousand men, against the "rough rug-headed kerns," to complete the work of conquest and organization which Richard had begun. The King followed Surrey in the spring, and receiving the overwhelming intelligence of Henry of Lancaster's arrival in England and triumphal entry into London, returned at the end of July to find on his landing at Milford Haven his kingdom lost. In the general desertion of the nobles Surrey chivalrously stood by his King and his friend, and was despatched by Richard to Henry, together with his uncle, Richard's half-brother, John Holland, Duke of Exeter, to inquire his intention. Henry, with his usual cold astuteness, detained the ambassadors till he had got his luckless cousin safe in his power. Then followed the meeting of Parliament, with the fierce challenges and mutual accusations of treasons. No fewer than forty gauntlets of defiance were thrown on the floor of the House, and as the result of this contest, so vividly portrayed by Shakspeare in his *Richard II.* (iv. 1), the appellants were degraded, and Surrey narrowly escaped with his life, the citizens of London having petitioned for his capital punishment as one of the chief abettors of the late King in his illegal exactions.

What Surrey had failed to secure by force he now resolved to gain by stratagem. Henry was to keep his Christmas at Windsor. He and the Earl of Salisbury and others of the lords appellant who had met at Oxford, under pretext of a tournament, to arrange the plot, were to obtain entrance into the castle in the disguise of mummers, murder Henry and his son, and restore Richard. On the eve of its execution the plot was divulged by the Duke of Rutland, one of the conspirators. Henry and his sons immediately fled from Windsor and took refuge in the Tower of London, whence he issued orders for the apprehension of Surrey and his adherents as traitors, and began to levy troops to crush the possible rebellion. On the arrival of the supposed mummers, in the twilight of Sunday, January 5, 1400, the eve of the festival of the Epiphany, with four hundred men-at-arms in their wake, they found the castle gates closed against them, and guards ready to give them a warm reception. Taking the alarm they dashed off without attempting to enter, followed by the royal force to Sonning, where Isabella, Richard's young Queen, was sojourning. Surrey's gallant defence of Maidenhead Bridge against his pursuers, to secure the retreat of his party, was long remembered. Having apprised Isabella of his intention to restore her husband, who he told her had broken his prison at Pomfret, and was awaiting her with a force of a hundred thousand men, but obtaining little credence for his tale from the hapless young foreigner, he pressed on westwards, after tearing the royal badges off his servants' necks, to Wallingford and Abingdon, commanding the populace everywhere to arm for King Richard. At nightfall the next day the party, weary with their long ride, arrived at Cirencester, with the same summons. But the King's writ for their apprehension had already reached the town and was in the mayor's hands before their arrival. While parleying with the new-comers, the mayor secretly summoned his burghers and the fighting men of the vicinity to his aid and closed all the outlets of the town with archers. About midnight Surrey and his party, not liking the appearance of things, set themselves to quit the town, but found their exit firmly resisted. A desperate street fight ensued which lasted till daybreak, when, finding resistance hopeless, they took refuge in the Abbey Church, offering to surrender if they might be allowed to go to speak with the King. Their fate was sealed by a hot-headed priest of their party, who, hoping to create a diversion in their favour, fired the town during the parley. This only exasperated the townsfolk the more, and, letting the houses burn, they dragged Surrey and Salisbury out of the church, beheaded them in the market-place, and sent their heads to the King at Oxford, by whom they were set up on London Bridge. Thirteen years afterwards his widow obtained permission from the King to have the head taken down, and the body of her brave and unfortunate husband removed from its grave at Cirencester, and reinterred in a tomb at Mount Grace. The loyal people of Cirencester, whose decisive action had so effectually crushed this rebellion, were rewarded by an annual grant of four does from the royal forests and a hogshead of wine for the men, and six does and another hogshead of wine for the women, who had been specially zealous in stirring up their husbands and sons to fight for the King.

The priory of which the chivalrous and ill-fated Surrey was the founder deserves, as we have said, more attention than it has hitherto received, as the only example of the singular Carthusian arrangement now existing in England. The rule of St. Bruno it will be remembered attempted a sort of union of the solitary and the cœnobitic life. The brothers formed one community, contained within one enclosure, worshipping in the same church, meeting on high days in the same refectory, and sharing in the same cloister and conventual buildings; but instead of the common dormitory and day-room each had his own small cottage, comprising a sitting-room and bed-room and closets, with a little garden attached, to be cultivated with his own hands. Of this arrangement—which we see on a grand scale at the world-famous Certosa of Pavia and that near Florence, as well as in the parent house, "La Grande Chartreuse" at Grenoble—the little Yorkshire priory supplies a small but most interesting example, perfectly unique in England. Nowhere else can we see the two courts—the outer court to the south for the "conversi" or lay brethren, and for those who did not adopt the rule of the community in its full strictness, in which were also the apartments for the reception of guests; and the inner court to the north, separated from it by the church and prior's house, containing the residences of the brethren. This court was originally surrounded with a pentice cloister, the hooked corbels of the roof of which remain projecting from the walls, from which the "domunculæ" of the monks, five on each side, opened by small, square-headed doorways. On the right hand of each doorway is a small square-headed hatch for the admission of food from the general kitchen and other necessaries, the rule of the order prohibiting any one from entering a brother's cell except from absolute necessity. These apertures do not go straight through the wall, but turn twice at a right angle—like a straight-limbed Z—so as effectually to prevent any one looking out or looking in. The same arrangement for securing absolute privacy is found in Carthusian houses generally. Many of our readers will have seen

it at the Grande Chartreuse, and we have seen it at Pavia, Florence, and the convent of Miraflores, near Burgos. Of these houses, the mother house by Grenoble and that near Florence are alone still occupied by the order, the *Certose* of Pavia and Miraflores having both been suppressed in very recent times. The little houses in which the brothers passed their lives, in perpetual silence, chiefly employed in copying books, mindful of their founder's words, that "he who transcribes holy books preaches silently with his hands," were of two stories. Each floor, twenty feet square, was divided by a wooden partition into a chamber and a closet, comprising the day-room with a fireplace below, and the sleeping-room above. One of the closets formed an oratory, the other contained the brothers' scanty stock of tools and implements. A little walled garden lay in the rear of each dwelling. As the rule of the order required the strictest austerity of life, the most studied plainness prevails in every part of these little dwellings. The doors and windows are mere apertures in the walls. Towards the western part of the south side of the cloister wall under the prior's house are the lavatories. The general refectory, in which the brethren only met on festivals, ought to be adjacent, but this part is too much ruined to allow its place to be accurately determined.

The church that divides the two courts displays a little more architectural skill. It consisted of a very short nave and a long aisleless choir, a central tower, and broad shallow transepts opening not from the crossing, but from the nave. The straight joints show that the chancel and transepts are later additions belonging to the second period of building. The tower and the nave indicate by their style that they form part of Surrey's original work. The chancel has entirely perished with the exception of the north wall, but its foundations can be clearly traced. The best specimens of architecture in the church are the four tall richly-moulded and well-proportioned arches which support the tower. Singularly enough, the octagonal capitals do not fit the triple group of shafts which they surmount. Indeed, in every part of the church we notice perplexing marks of botching and alteration, to be looked for in a building resumed after some years' suspension, during which architectural taste as well as the wishes of the builders had changed. Access to the outer court is given by a gate-house at the north-west court. It was divided by two transverse arches, and had very flat groining. Immediately adjacent to the gate-house is a very picturesque gabled house built on to the old buttressed walls. The square-headed windows, with stone mullions and the gables capped with balls, look almost earlier than the date which is to be read on the projecting square porch, 1654. The fine ash-trees which grow in and about the courts add much to the effect of the picture. The situation is one of much beauty, in a level green meadow, watered with a copious stream, at the foot of a high bank of wood covering the steep side of the long hill dividing Mount Grace from Osmotherley, on an elevated point of which is a little wayside chapel bearing the date 1515. The ruins are kept in tolerable repair; but a good work might be done in removing the rubbish which encumbers the houses, and conceals their arrangement. Such irreparable mischief has been done by ignorant restoration that we almost shrink from suggesting anything like repair. But the interest of the place would be greatly increased if the window-jambs and other pieces of cut stone found in the *débris* were simply replaced in their original positions and the ruined walls built up of the old materials. But such a work should only be undertaken under the most careful superintendence.

THE RED-LETTER DAYS OF COMMON LIFE.

THE statesman who formulated the now well-worn sentence on the intolerable weariness of amusements spoke from a point of view in which amusements are not a relaxation, but a labour. When a man is compelled to go out who desires to stay at home, or is obliged to sacrifice an interval of much-needed rest to some conventional necessity of exhibiting himself, his presence at a festivity is as much a part of his life's labour as is that of the coachman who drives him there; and he is not amusing himself or being amused in any true sense of the word. He is, or may be, contributing to the relaxation of others, like the hard-worked drivers and horses of pleasure-vans during the excursion season of Londoners. His red-letter days are those in which his diary presents a blank to be filled up as he chooses, or to be left blank if he be so minded. A life crowded with varying events must seek its variety in the uneventful; and, conversely, a life which passes in the repetition of an unvarying round of monotonous duty within narrow limits will find its variety and interest in events of infinitesimal magnitude. Small as they are in themselves, they stand out in some relief above a dead level; just as, if memory can be trusted to go back to those long-lost summers when it was possible to lie down on the grass, a mole-hill, regarded from such a position, will, without much effort of the imagination, assume the proportions of a mountain in a horizon measured by inches instead of miles. Thus the calendar of the agricultural labourer is still, though in a less degree than formerly, divided by the most minute incidents; and the record of his memory is assisted by landmarks which have varied the routine of his life with trifles which would have faded from the cosmopolite remembrance in a day. His experience now is something like that of the middle-class resident of a country town in the old untravelling days, who would not seldom be able to describe his fellow-passengers by the stage-coach in every one of the unfrequent journeys which he had made during the last ten years. His dates have been marked by reference to the fairs of the market-town, or the club-day of his own or some neighbouring village; and his observation, frequently very acute within his own range, will be preserved in some such form as the current Worcestershire saying that "the cuckoo buys a horse at Pershore fair." The keenness of his appreciation of some unexpected variety from the monotony of his ordinary round will often present a curious contradiction to the doctrine of the weariness of amusements. By way of instance, let the hounds come within sight in a difficult hunting country, where the chance only occurs once or twice in the season. It will be worth the while of any London guest at the parsonage to study the effect produced upon the steady-going man and his boy at work in the garden; that is, if the guest is quick to seize the opportunity, which will be but fleeting if the rector is not very inexperienced in country ways, and if there is no very pressing duty on hand. For the rector's general rule is probably somewhat to this effect:—"If the hounds come this way, go, without waiting to look for me and ask leave"—as he is fully aware that the work will not suffer, but will be done all the better after the dozen miles run, which would knock himself up for a week, even if he could make the attempt. The "man" on these occasions is observed, by his wife's account, to exhibit an unusual staying power in postponing his dinner, and he has an eye that can see a fox at distances where his master, who is apt to boast that he has not "come to glasses" as yet, is not altogether sure that he can make out a horse. He chances short cuts in the right places as if he were in the personal confidence of the fox, and explains afterwards that it was "the way they were bound to go when the wind was downhill, and the same as it was four years ago, and one time before that when they killed in the back orchard at the Court."

But the sight of the hounds in such a district is a movable festival at best, and one which moves in an irregular and eccentric orbit; besides that its due celebration is necessarily confined to a privileged few. A red-letter day of universal observance in an agricultural neighbourhood, of which the recurrence is as certain as the harvest, and certain in the same degree, and of which the date is approximately fixed in the domestic calendar, has passed into a proverb which we believe is considered, in genteel circles, something too vulgar to quote. It will be remembered in the caustic but over-bitter series of "Naggleton" papers which appeared some years since in *Punch*, that a scene occurs at a little dinner at Greenwich, where the husband, after the first bottle of champagne, becomes genial in his fashion, and declares that "We don't kill a pig every day, you know," to the great horror of the lady, who fears that the waiter and the people at the next table will imagine that such an event is literally known in their economy. No doubt the proverb is homely enough, and in the vulgar tongue; but not the less, or perhaps all the more, does it catch and embody the spirit of a real delight, which every one familiar with rural life will recognize as existing. "Killing the pig" is a festival anticipated and provided for all the year through; and not more surely does the picture of the baby-year coming in while the infirm year departs make its appearance in the almanacs than the purchase and bringing home of the innocent-looking little pig waits upon the slaughter of his unwieldy but by no means infirm predecessor. His growth, progress, and general welfare are watched as the year goes on with an affectionate regard which its object does not fail to observe, and which, mistaking its motive, he returns with a demonstrative joy almost pitiful in its absurdity. He cannot help not being your dog, and it is hard that his advances should be rejected with such marked aversion. In time he outgrows this weakness, and subsides into a selfish contempt for mankind as the period approaches when—for the picture and its legend, although generally regarded as a slightly profane joke, were of actual and *bonâ fide* reality—his happy owner leans contemplatively upon the sty with—"Ah! if we were only all on us as ready to die as he be!" The comparison was certainly incongruous; but that it was not consciously so, and, still more, that it was not irreverent, will be understood by any one who has chanced to come across the beaming face of the owner when at last the pig has been duly, and not in the waning of the moon, killed, hung, and weighed. But not for sale. The proverb knows nothing of "pork-butchers"; and the row of pendent carcases, bedizened with evergreen in the glare of gas-burners has not the trace of an association with the solitary monarch of the lean-to or the back-kitchen, where his admirers can hardly walk round him, and where "You see, sir, he be a touching the floor." The hams may perhaps be parted with as a favour to the doctor or the curate, who appreciates the difference between "home-cured" and Bishopsgate Street; but the pig which is "not killed every day" means a week of luxurious dinners, and kindly presents of "fry" to neighbours, and pork-pies sent by the carrier to married daughters, in homes where, when the proverb was new, living was much scantier and harder and more unvaried even than it is now. And, after the actual festival is over, there are the rashers in long series to fall back upon, and to suggest the promise of rural plenty in low-ceilinged dwellings, at times even to an unobservant visitor with only too much distinctness. The contact of one's head with cured bacon is not an agreeable experience.

The redness of this special red-letter day is a question of degree as well as of character; and as the celebration, while common to all the families in each community, is distinct and separate for

each, being a household and not a tribal function, there is much friendly comparison and rivalry as preparation moves onward to result; and the final examiner and referee is the steelyard. Every owner of a pig to kill is necessarily in the first instance concerned with his own prospects and his own success; but beyond this his interests and sympathies go out to his neighbours, and he measures their anticipated or realized good fortune by the gratification which he experiences in his own. It is probable that in a friendly and well-regulated parish—we make the inference *à priori* and on general principles only, without the advantage of any guidance from induction—the importance attaching to the fact that the parson's best pig had "come nigh on three-and-twenty score, and there was never one not more than twenty killed at the rectory before," would considerably outweigh that of the "First in Mods" which the parson's son had just brought home from Oxford.

If we have entered rather fully into detail on a very commonplace, and, if it so be, a very vulgar subject, it has been by way of comparing the enjoyments which give actual variety to the monotone of common life with those which are "made to order," or which exist only in advertisements. Nobody believes in the existence of the conventional family grinning over a great pudding, and we suppose that the perpetuation of this form of art would be defended on the ground that it is symbolical, and not representative in its intention; and similarly it may be argued that some stupid contrivance which is meant to swell the Christmas balance of a puffing tradesman is not really expected to bring to thousands of homes the ever-new delight which the advertisements promise. But there is a widely prevailing theory that people can be amused—and specially those people who are called the poor—much in the same way that it is also supposed they can "be done good to"—that is, in some way which seems good to a patronizing fussiness, irrespectively of any consideration of what "the people" like for themselves. To provide a real enjoyment for any one it would seem to be a necessary preliminary to study what he or she really enjoys; and it is quite possible to give a wide amount of gratification on this basis without any compromise of principle or encouragement to low and depraved tastes. The eccentric old lady in one of Dickens's later stories who sent for a little boy into her presence and then ordered him to "play" with a strange little girl knew nothing of child-nature; and a similar ignorance of human nature generally may be shown by persons who are not, or who do not consider themselves, in any way eccentric. In many parts of the country recent experience has shown the failure of attempts to revive, on a new basis, traditional festivities of the past; and, among others, with unfortunate forgetfulness of the change of style, the supposed and bygone glories of May-day. What statistics of rheumatism and bronchitis may have been supplied by the combination of east winds and driving rain with ecclesiastical proprieties on this most inclement festival, the local club-doctors may probably be able to tell; but the experiment has been tried with a non-success sufficient, we believe, to have already secured its general abandonment. English people may amuse themselves sadly, but they will not be amused except in their own way. It may be an inartistic and commonplace way enough; their whole lives for the most part are of such a character; but any one who both desires and has the opportunity to bring something of relaxation and variety into monotonous lives had better at once abandon theories and look about him for facts of observation, get rid of all ideas of bank holidays and other wholesale pleasure-manufacturing inventions, study local preferences and individual character, and give his servants and others over whose time and work he may have control a liberal amount of credit alike for self-respect and for knowing their own minds.

LIFEBOATS.

A SHORT statement of the work done by lifeboats during the past year, which has recently appeared in some of the daily papers, is given with the modesty and brevity which always distinguish the publications of the Lifeboat Institution. Indeed it may perhaps be thought that in days when bragging and puffing are so general, and are so often thought necessary, even by those who have a good cause to serve, the Society is something too modest, and hardly states with sufficient emphasis the claims which it has for widely extended support. With the exception of the great hospitals, there is probably no institution in this country which does so much good and averts so much misery as this one; and possibly it might be well if its merits were brought somewhat more prominently before a public little given to paying attention to anything that is not very loudly proclaimed. Possibly, however, those who work for the Institution are wise in speaking in the simplest manner of the achievements of the crews, and in refraining from any of the noisy solicitations for aid which are so common. Those achievements are such that to state them in the most curt manner is perhaps to state them in the most impressive manner. It may be hoped that a Society which, since its formation, has saved or contributed to save the lives of nearly twenty-seven thousand people, can dispense with the art of the philanthropic advertiser.

During 1879 the lifeboats saved 637 lives, and, in addition to these, 218 lives were saved by fishing crews, who received rewards from the Institution; so that body may fairly point to the rescue of 855 people from drowning, or from a lingering and terrible death by exposure, as the result of its labours during the past year. Wonderful, however, as such a result is, the mere statement of it scarcely shows all the good the Society has done. It must be remembered that a large proportion of those who were thus rescued were poor men who were supporting families. When seamen and fishermen are drowned, their wives and children are left destitute. The effect, therefore, of what the Lifeboat Institution has done has been not merely to save a number of lives, but to preserve a great many women and children from want. The success of the crews in saving property is of course much less impressive than their success in rescuing men from drowning; but it must not be forgotten that they brought safely into harbour not a few vessels which, had it not been for their efforts, must have been lost with their cargoes.

The account of which we have spoken gives the list of the services of the lifeboats in the briefest form, scarcely anything being stated beyond the names of the vessels and the number of people saved in each case. So far as regards the work of the crews during the latter half of the past year, no fuller record is at present obtainable; and probably the account of what was done during the tremendous gales of December will not appear for some time. Of the work done during the first half of the year a description—more detailed than a mere summary, but by no means erring on the side of prolixity—has been published, the Institution having, according to their custom, given short notes of the services of the lifeboats in the numbers of their journal issued in August and November. These, as usual, attracted small attention at the time of their appearance, the public being willing to indulge in a sentimental and rather vague admiration for lifeboats, but caring little to learn anything in detail of the work of the crews. Now that a concise statement has shown what has actually been done during the year, and that gales of unusual fury have caused people to think somewhat of the terrible dangers to which, in spite of all the contrivances of civilization, vessels on our coasts are still exposed, it is not impossible that the brief records published by the Lifeboat Institution may receive some notice. How well it is merited need hardly be said. Rightly enough, any shortcomings which endanger human life receive universal condemnation; and it is only fair that the other side of the picture should be considered, and that some attention should be given to the courage and skill by which so many lives are preserved.

The curt narratives of the Lifeboat Institution are marked in one respect by a gratifying monotony. They all tell, in simple language, a like story of determined and fearless effort and of success in a noble service. There is necessarily a certain resemblance in the accounts of the achievements of the crews, which, from the unpretentious manner in which they are described, may perhaps be less highly estimated than they should be. Some readers may scarcely realize the nature of the work which these men have to do during the tremendous gales of the winter and spring, or the unflinching courage which is invariably shown. Many may fail to appreciate all the bravery and skill of which the brief paragraphs tell. Happily, however, there are amongst these plain little narratives, all telling of the resolute performance of duty, some which can hardly fail to strike even the most careless reader as being records of acts of the highest courage. As an instance, we would specially refer to the rescue of the crew and captain of a French brig last spring. This vessel got ashore at Perran, five miles to the eastward of Penzance, grounding some five or six hundred yards from the beach. Rockets were thrown over her, but only one man got ashore by the hawser, and when a barge manned by some young fishermen got out to the brig, the crew refused to leave her. The Penzance lifeboat had been launched when news of the disaster arrived, and she went under sail to the wreck; but no notice was taken of her for some time, as the master was unwilling that the crew should leave the vessel, having apparently some wild idea that she could be saved. The wind, which steadily increased, veered round to the west, and it became clear that "the vessel was in a most dangerous position, she being in the breakers, full of water, and surrounded by rocks." Indeed, the lifeboat itself must have been in no inconsiderable danger. However, the men held to their work heroically, and ultimately the sailors on board the brig, five in number, got into the boat. The captain, however, absolutely refused to leave the vessel. The lifeboat men rowed away for a short distance, but finding that the sea was still getting up, and that the wind was veering more and more to the west, so that the brig would almost to a certainty break up soon, they returned to her, and urged the captain to come on board. He again refused, and after a time the lifeboat was obliged to leave the vessel, having been struck by several seas, which had nearly swamped her, and having had three oars broken. She returned to Penzance—a distance of five miles, be it observed—and there landed the rescued French sailors. After she had gone a coastguardsman made an heroic effort to save the French fanatic, and going out along the rocket line, succeeded in getting under the bows of the brig; but the captain, who was either inspired by some intense feeling of duty or had altogether lost his head, again refused to quit the vessel. The coastguardsman was hauled back, and, as may well be imagined, was in a very exhausted state when he reached the shore. The vessel began to break up, and when one of the masts went over the side, the captain, who, in spite of his contempt for life, had taken refuge in the rigging, was thrown down and buried in the wreckage. Emerging from this, he came to his senses at last, and, seizing the line of one of the rockets which had been thrown over the brig, got a life-buoy on board by means of it. Supported by this he was hauled ashore, the coastguardsmen forming

a line hand in hand, and pulling him through the surf. At the time when this happened, the lifeboat, having landed the five men at Penzance, was on her way back through the terrific sea, the crew being determined to make one more effort to rescue the lunatic who had twice refused the aid proffered him. It is difficult to imagine a more courageous or persistent effort to save life.

The magnificent effort of the crew on this occasion was undoubtedly more remarkable than anything else done by lifeboats during the first half of the year, but many of the achievements of other crews showed noble courage and determination, and are well worthy of remembrance. To one we would specially refer as an instance of a brave rescue, and also as showing how dangerous the service is, in spite of the admirable qualities of modern lifeboats. In February last a barque went ashore near Brighstone Grange, Isle of Wight. The lifeboat put out, but the sea was very heavy, and when at length the vessel was reached, she was on the point of breaking up. Saving the crew was a very difficult task, the boat being overwhelmed by heavy seas and the men nearly washed out of her. They succeeded at last, however, in rescuing the crew of the barque, and then put back. At the moment when the boat's bow touched the steep beach, a sea caught her, swung her round, and turned her over. All on board her were of course thrown into the surf. Happily the results were very different from those of a rather similar accident which occurred some years ago in the West of England. Although several of the men who were thrown out of the Isle of Wight lifeboat were nearly drawn out to sea, all were ultimately saved. On several other occasions the crews of lifeboats were in danger nearly as great as this.

It seems somewhat strange, considering the perils which these crews incur, the arduous nature of their work at all times, and the admirable energy and courage which they show, that there is not a better recognition of the services they render. A hazy admiration is generally felt for them; but with the expression of this public gratitude ends. Little is said of what the crews of the lifeboats do save when extraordinary achievements attract notice; and even these excite but lukewarm enthusiasm, and are soon forgotten. The wreck of the French brig was much spoken of at the time when it occurred, owing principally to the extraordinary behaviour of the captain, and some admiration was expressed for the courage of the coastguardsman and the noble conduct of the lifeboat crew; but both were soon forgotten, and probably now are only remembered by those who study the excellent, but not very widely read, publications of the National Lifeboat Institution. In much the same way have other similar services been treated; for happily the effort of the Penzance crew does not stand alone, or nearly alone. In past years there have been deeds quite as remarkable as theirs. Brave as these seamen were, they were not braver than the men of the Cullercoats boat, who, in a desperate attempt to save a cabin-boy's life, stayed by a ship which was breaking up until they were all but overwhelmed by the fall of the mainmast, or than the crew of the *Sabrina* lifeboat, who, seeing their consort disabled and nearly sunk when lying alongside a stranded vessel, went alongside her themselves and rescued every man on board. Many more instances might be cited in which similar courage and seamanlike skill have been shown by the men who work under the direction of the Lifeboat Institution. Yet how little admiration is shown for these splendid exploits, and how soon are they forgotten! This indifference seems the more remarkable when it is contrasted with the enthusiasm which in these somewhat sentimental days is often shown about acts of no very extraordinary valour. It being generally accepted, apparently, that the lifeboat crews are very fine fellows, the public shows none of its usual fervour about even their best achievements, and the men's devotion and bravery are taken as matters of course. It is, perhaps, well that it should be so, for the work could not be better done than it is, and perhaps no good results would follow if the sailors found themselves as famous as the heroes of the day are. Still, in times when gush is so common, the public apathy is not easily accounted for, though it may possibly be ascribed to a general impression that hardship and death by drowning are not the same to sailors as they are to other men.

THE GROSVENOR GALLERY.

SIR COUTTS LINDSAY has found an agreeable novelty for the winter exhibition at the Grosvenor Gallery in the collection of modern pictures of the Dutch school which is shown in the west gallery. There is something very attractive in the coolness of colour and quietude of design which for the most part distinguish these works, which are contributed by the members of the Society of Water-Colour Painters of the Hague, the President of which is M. Mesdag. He is represented by "At Anchor" (5) and "Caulking" (44), both of which, and perhaps especially the latter, are excellent specimens of his work. M. Maris contributes several works, amongst which we may particularly notice "A View at Schiedam" (19), which is remarkable for its fine effect of light, and "The Peacock Feather," an exceedingly clever, if sketchy, piece of work. One of the most charming of these pictures is "Reading the News" (6), by M. Henkes. In this the management of atmosphere and light is singularly true and attractive, and the whole effect is as pretty and pleasing as it is simple. M. Israels is not seen at his best, but his "Happy Home" (10) has much of his characteristic tenderness of feeling and expression. In connexion with this we may mention "Baby's Dinner" (54), by M. Blommers, which is a pleasant work, much in the style of M. Israels. M. W. Maris's "Ducks" (47) is charming in feeling and in execution, and so is "The Milking Yard" (40), by M. A. Mauve. A subject of the same class is well chosen and treated in M. Roelose's "Duck Pond" (25). Amongst these pictures are exhibited Mr. Alma-Tadema's "Amateurs" (13), which has been seen before elsewhere, but which we are glad to see again, and Miss Clara Montalba's "Greenhithe" (30), which goes well with its surroundings, and may rank worthily with the pictures from the same hand to which we called attention last week. M. Du Chattel's "A Bright Day" (45) suggests pleasing reminiscences of Daubigny and of Corot.

Among the English contributions, taking the pictures in the order of the Catalogue, we may note two works by Mr. Mark Fisher (63, 66), an excellent portrait of Mr. Guthrie by Mr. J. Parker (67), and a good and tender picture by Mr. Fahey, called "The Fair Maid of the Farm" (72). Mr. Holiday sends "The Rhine Maidens" (76), which is an illustration of the first scene of Herr Wagner's *Das Rheingold*. The picture is not without merit, but would, we think, without the help of the Catalogue, entirely fail to suggest that its place is supposed to be at the bottom of the Rhine. One would rather take it for the summit of a mountain range. Perhaps the introduction of "here and there a lusty trout, and here and there a grayling," might serve to throw some light upon the matter. Mr. Herkomer, who seems to aim at strength before everything, has certainly reached it in his "Descendant of the Romans" (85), which represents, with obvious faithfulness, a face the type of which does not suggest the title given to it. People who have been delighted with Mr. Walter Crane's book illustrations cannot but be disappointed with his "Triumph of Spring" (96), which is unsatisfactory alike in drawing, colour, and design. Such disappointment, however, can be made up for by going a little further and pausing before "The Music Lesson" (101), by Mr. Tristram Ellis. A parallel to this work has seldom been seen before. It can be compared only to a celebrated picture exhibited two years ago by a Royal Academician, which afforded solace and entertainment to all who were weary with much tramping through the galleries of the Academy. Mr. Ellis's work is on a much smaller scale than was this famous production; but, to borrow a phrase from literature, it is exceedingly terse. It is worth close study; for it is not probable that anything quite like it will ever be seen again on the walls of a picture-gallery. Mr. H. J. Stork has an interesting and not unpoetical picture (115), which is thus described in the Catalogue:—"Sellner, seeing the spirit of his dead wife playing on her harp when in the agony of his grief, seeks to recall her image by repeating on his flute some of her favourite airs. While he continued to play, the harp played with him; but directly he ceased, its tone and the apparition faded away.—Theodore Körner's *Harp*." Mr. Poynter, with cryptic humour, assigns to a clever moonlight study (116) this quotation:—

> 'Tis a day
> Such as a day is when the sun is hid.

Mr. J. D. Linton's "Youth and Time" (118) is singularly fine and strong, despite certain faults, such as the excessive bigness of Time's right arm. But there is a charm about the colour, composition, and, for the most part, mastery of drawing which more than atones for any such faults. We may note also the fine expression, sense of colour, and treatment of textures shown in the same painter's "A Study" (124). Mr. Marsh's "Portrait (132) of F. W. Hall Esq.," who stands gun in hand against a background of sky seen through trees, is striking and clever. Mr. Brewtnall's "Summer Afternoon" (136) is as disagreeably hot and uninteresting as Mr. Morris's "Silver Twilight" (146) is cool and pleasing.

In the Sculpture and Water-Colour Galleries we may note a bold and successful experiment in colour by Mr. Percy Macquoid in his "Portrait of Mrs. Ernest Baggallay" (171), Mr. Walter Severn's "Tintageux, Isle of Sark" (184), a good work in the manner of Mr. Brett, and a clever sketch of "Delft" (185), by Mr. Hamilton Aïdé. Miss D. Tennant sends "The Idlers" (195), a highly satisfactory production. There is no attempt to make a fancy picture of the subject—street urchins on the Embankment wall—but there is as much tenderness as truth in the work. Mr. O'Connor's "Old Bridge at Lincoln" (205) is very bright and pleasant, and is another proof that he has escaped from the danger which at one time seemed to threaten him of too great a tendency to dingy colouring. Mr. D. Carr's "Red Roses" (27) is excellent both in drawing and colour. In the vestibule Mr. F. Sandys shows three portraits—257, Mr. Cyril Flower; 258, Mrs. Cyril Flower; 259, Mrs. William Brand—which combine in a marked and admirable degree the qualities of strength and finish. The treatment of the lace in one of them is especially remarkable. The same artist's "Proud Maisie" (265) is a fine and striking work. Mr. T. E. Harrison's group (269-272) suggests a quaint and not unpleasing reminiscence of Mantegna. Mr. R. W. Macbeth, in his "Study in Chalk" (278), seems to have been thinking of M. Degaz, and in his "Ballet-Study in Chalk" (279) of Señor Fortuny. Both works are executed with much dash and force. Of Mr. Hallé's two portraits, "Lieutenant William C. James" (280), and "Mrs. George Salis-Schwabe" (296), we prefer the former, both as a likeness and a drawing.

The East Gallery is very rich in drawings and studies by living English artists, and it is noteworthy that some of the very finest of them deal with flowers and foliage. Sir Frederick Leighton's con-

tributions are very remarkable. Amongst many all of which are worth study, we propose to call attention to some which seem particularly striking; and we may first note "The Pozzo Corner, Venice" (394), a singularly strong and fine piece of work, which has about it an impressive sense of solidity, and "A Lemon Tree" (408), the delicacy and accuracy of which remind one of similar work by Lionardo. It is worth noting that the side of the drawing contains careful studies for the snails, and so on, which are reproduced on a much smaller scale among the leaves of the tree. Many studies of heads, and perhaps especially those numbered 411, demand attention, and the study of an arm (500), which hangs on one of the screens, is a masterly performance. People who are infected with the superstition that the smoothness which Sir F. Leighton affects in his oil-paintings is allied with weakness cannot do better than go to the Grosvenor Gallery, and there rid themselves of their vain belief. Of Mr. Poynter's many contributions, perhaps the best are found under the number 431. These have much force and truth. Mr. A. Moore's studies of foliage and flowers (441, 442, 454) are charmingly delicate and truthful, and his "Drapery Cartoon" (297) contains some admirably free and correct drawing. Mr. Burne-Jones sends a quantity of things, to criticize all of which in detail would demand a separate article. It may be said of them generally that the artist's striking merits come out chiefly in his studies of drapery, while his weakness is shown in his studies of the nude, such as "Discordia" (345). But the drapery, and some of the heads, notably 369, are thoroughly to be admired. We should mention also the "Study of Lilies" (379), the execution of which is nearly perfect. Mr. Watts's "Design for a Window in St. Paul's—The Transfiguration," shows much poetic imagination and power, and will well repay study. Mr. Marks, besides the studies and sketches for pictures which he exhibits in the East Gallery and elsewhere, has here two studies of trees (315, 317), which are as admirable as his pictures which deal with human beings. M. Legros's portraits are not satisfactory, and we confess to being thoroughly tired of heads "drawn from the life before the students of the Slade school." Mr. W. B. Richmond sends a good many comparatively unimportant studies, and a "Study of a Female Figure —Red Chalk" (325), which has much grace and beauty. Lady Lindsay sends some portraits, the best of which to our thinking is that of Mrs. Comyns Carr (333). Mr. Millais's four illustrations to "Barry Lyndon" (311-314) are admirable alike in idea and execution.

The exhibition is highly attractive, not only because it contains much that is pleasant to the eye, but also because the student of drawing may spend a good deal of time in it very profitably as well as agreeably. Indeed, for purposes of comparison the show of drawings could hardly be better.

REVIEWS.

LENTHÉRIC'S PROVENCE MARITIME.*

THIS, though it appears as a separate book, is really the third and concluding volume of one work which might be simply entitled "Provence." The first volume was entitled *Les Villes Mortes du Golfe de Lyon*, and was published in 1876; the second, which appeared in 1878, was called *La Grèce et l'Orient en Provence;* and now *La Provence Maritime* completes the series. We have never met with a work of this class more thoroughly well done. We noticed the preceding volumes at the time of their publication, and it is unnecessary to recur to them in this place; yet it would be unfair to the author to speak of his last volume as if it were an isolated effort. The three books form one important work containing more than fifteen hundred pages of text, and thirty maps, most of which are new and drawn by the author from his personal knowledge of the localities. The volumes are convenient in size and admirably printed, the maps being in three colours, for clearness. On the whole, this is by far the best work on Provence that we ever met with.

M. Lenthéric's position has been highly favourable to the production of a book of this kind. Passionately attached to archæological studies, he has united to the knowledge of an archæologist the training of a civil engineer; and the value of such a combination to an author who had to deal with such a subject as the Rhône and the coast of Provence is beyond estimate. No mere literary faculty, however eminent, could give the weight and solidity which M. Lenthéric derives from this double education. But he is neither tiresome as an archæologist nor unpleasantly professional as an engineer. His knowledge is tempered by literary taste, and often enlivened by a certain degree of artistic perception, not enough to carry him away into the dangerous region of word-painting, yet enough to enable him to set the character of a locality very clearly before his readers. He has the natural gifts of local affection and observation, gifts for which no amount of knowledge acquired from others can ever supply a substitute. When M. Lenthéric describes a place, it is evident at once that he has seen it, and not only seen it, but explored it with an intelligent and zealous curiosity. Nor does he see in it simply the present; he has the historical sense, and sees past and present at the same time. Again, his love for places does not lead him into the common error of those who describe their native land—the error of painting everything *couleur de rose*. What M. Lenthéric possesses of the artistic sense preserves him from such a fatal mistake. He perceives that the real superiority of Provence as a subject for description lies in its almost incredible contrasts. It is a land of horrible deserts and earthly paradises, a land which is arid in parts and in other parts well watered, a land whose plains are uglier than those of Holland, and which includes some of the most varied and most charming mountain scenery in Europe. It is not generally a pleasant country to live in, and yet there are corners of it more precisely adapted to human habitation than any other places in the world. But with all its faults, and they are many, Provence has the great merit of being always interesting to people of cultivated intelligence, to the geographer, the antiquary, and the artist. Even its most desolate regions have their own interest. Its cities are full of the poetry of the past, its rivers are grand and terrible, its sea coast is full of variety, with many a bay and creek, and at least one important salt-water loch.

In the earlier pages of M. Lenthéric's last volume we find him marking, with the precision of a true observer, the line of physical geography which separates Northern from Southern France. He speaks of the well-known voyage down the Rhône, and tells us where the voyager first enters on the true Southern land. It is when he has passed through the narrow gorge near Viviers and approaches Donzère, in the most picturesque part of the Rhône between Lyons and the sea:—

> Lorsqu'on descend le Rhône de Lyon vers la mer, on voit, à partir de Valence, la vallée se resserrer peu à peu; sur la rive droite, la vieille cathédrale de Viviers dresse au sommet d'une falaise ses clochetons gothiques; les rochers se rapprochent, et le fleuve traverse une écluse étroite où les ingénieurs, à court d'espace, ont établi deux voies superposées, la route et le chemin de fer.
>
> Au sortir de la gorge, la vallée s'ouvre tout à coup, et on entre dans ce triangle privilégié dont les Cévennes et les Alpes forment les deux côtés et la Méditerranée la base. Là, sous l'influence du soleil et de l'âpre vent du Nord, la Provence revêt le climat sec qui la spécialise, et l'olivier apparaît pour la première fois sur les coteaux qui dominent le village de Donzère. C'est ainsi que finit le Nord de la France et que commence le Midi. Sur toutes les pentes, dans toutes les plaines, on le voit moutonner, "troupeau sombre et utile, le seul qui convienne à ces terrains pierreux brûlés par le soleil."

The characteristic tree of Provence is the olive, which marks the Mediterranean climate; but it is only in the extreme South of France, after having passed the mountain chains of Les Maures and L'Esterel, that the tree lives in its full vigour. As M. Lenthéric observes, it is almost pitiable in Upper Provence, and every artist would agree with him, for a more monotonous and unpicturesque tree than the ill-conditioned olive it would be difficult to name. But when once the olive gets to the land which suits it best, it becomes noble and grand, a worthy subject for art and a true decoration in nature:—

> A mesure qu'on descend vers la mer et qu'on avance du côté de l'Orient, le long de cette côte merveilleuse de Provence, les oliviers prennent un caractère de plus en plus décoratif. La pâleur de leur verdure se colore et s'accentue. Leurs petites masses arrondies se développent, et l'arbrisseau devient graduellement un arbre, dont le sommet cependant ne dépasse jamais le superbe dôme des pins. . . . Il faut avoir franchi les chaînes des Maures et de l'Esterel pour le connaître et l'admirer; jusque-là on le prendrait presque en pitié; mais à partir de Cannes il devient de plus en plus splendide; on ne le taille plus; il est primitif, robuste, monumental, et s'étale dans son orgueilleuse vitalité.

M. Lenthéric is a traveller of the slow persuasion, as all real observers are. He does not like railways, and says that "modern industry has carried the means of transport to such perfection that people do not know how to pause on the road, and by knowing so well the value of time, they have ceased to know how to enjoy it." The modern world flies along the railway from Marseilles to Genoa, and has deserted the beautiful and picturesque old road along the Cornice. M. Lenthéric travels in his own way in a boat along the coast, which he considers the best conveyance for the purpose. Unfortunately, as the railways have extinguished road travelling, the steamships have done exactly the same for the old coasting vessels which called at every little port and gave a capital opportunity for really seeing the country. As soon as the steamers leave the port of the Joliette, at Marseilles, they go out to sea, and describe an immense curve to some comparatively distant port, such as Genoa, whence they take another curve to some other considerable port, and so on, which makes it impossible to examine the details of a coast; and sea-travelling has become, as M. Lenthéric maliciously observes, a question of time, money, and sea-sickness. The following quotation explains his way of coasting in his own words:—

> Prenons donc une de ces modestes barques de pêche dont la forme et la voilure n'ont pas varié depuis plus de vingt siècles à la surface de toutes les mers latines; et, de même que celui qui veut connaître la Grèce antique doit délaisser les sentiers battus et, Pausanias à la main, escalader les collines rocheuses, suivre à pied le lit desséché des torrents et gravir les escarpements ruinés des acropoles, nous irons de port en port et d'île en île, fidèles à l'itinéraire maritime suivi il y a deux mille ans par les navigateurs grecs et phéniciens.
>
> Nous relâcherons avec le mauvais temps, nous nous reposerons avec la nuit, nous prendrons terre dans toutes les anses et nous remonterons le cours inférieur des vallées.

The rocky Mediterranean coast, beginning at Marseilles and extending as far as the Italian frontier, is about three hundred kilo-

* *La Provence Maritime, ancienne et moderne. La Ciotat, Tauroentum, Toulon, Hyères, Les Maures et l'Esterel, Fréjus, Cannes et Lérins, Antibes, Nice et Cimiez, Menton et Monaco.* Par Charles Lenthéric, Ingénieur des Ponts et Chaussées. Paris: Plon. 1880.

metres long, and is full of variety in consequence of its numerous promontories and bays. There the Alps themselves may be said to come down to the sea through a succession of inferior hills, which in some places protect very highly favoured strips of land from the terrible mistral or north wind which afflicts the valley of the Rhône. M. Lenthéric gives a most uninviting description of the Rhône climate, one of the most trying climates in Europe. Its influence extends even into Lower Burgundy in the north, and beyond Arles in the south, and a more dangerous climate for delicate people could hardly be found. M. Lenthéric describes it quite accurately as passing from excessive droughts in summer to intermittent torrential deluges in the rainy season and near the equinoxes, with hurricanes which sometimes last whole weeks—all these different phenomena succeeding each other without any understood cause. The excessive severity of the winter of 1879 in the Rhône climate may be partly attributed to a displacement of the fine weather. The rain fell in summer and autumn, the fine weather came in winter, and with it an intense frost. The cold has been such that an officer on horseback was seen riding on one of the rivers of Burgundy. In 1879 the cold invaded even the sheltered region about the coast, and it is said to have caused havoc amongst the olive-trees; the vines, too, have been extensively frozen; but, as a general rule, the eastern coast of Provence is safe from winter, and justifies M. Lenthéric's assertion "c'est un pays sans hiver." The ancient Romans knew the rare merits of that extraordinary strip of land, and in modern times, especially since the invention of railways, they have been more generally appreciated than ever.

M. Lenthéric tells us that agriculture did not exist in Provence, even in the most rudimentary state, before the sixth century B.C., the ancient authors unanimously attributing to the Greeks the importation of wheat, the vine, and the olive. The Celtic population lived by hunting and fishing on those very slopes of the Rhône which are now so rich in vineyards and olive-trees. After the Roman occupation a road was made from the Rhône to the Pyrenees by the Consul Domitius Ahenobarbus, which was called after him the Via Domitia; and another road was made later by the Consul Aurelius Cotta, called the Via Aurelia, or in Provençal the Camin Aourelian, and in modern French La Voie Aurélienne. M. Lenthéric gives a chapter to this Aurelian Way, along which we have not space to follow him. It is a nice subject for the disputes of local antiquaries, which we are of course quite unable to settle. According to our author's map, the road went by Vintimille and Mentone, whence, passing a little to the north of Monaco and Nice, it crossed the Var and passed through Antibes, Cannes, La Napoule, and Fréjus, where it left the coast and went inland to Aix. At Aix it separated into two branches—one of them going southwards to Marseilles and the other westwards. The branches met again near the modern village of Aureilles, and went together to Arles, where the road joined the Domitian Way to Spain.

The coral fishery at Cassis used to be a source of prosperity for the place. Boats came from considerable distances along the coast and fished the coral, which was generally prepared for the market at Cassis itself. Unluckily for the inhabitants of that place, coral has been going out of fashion by a slow decline in its popularity which has continued for nearly a century, and the fishery is now completely abandoned by the inhabitants. Occasionally a Spanish boat or two will come and drag for coral, but that is all. A new trade, the construction of steamers, has made La Ciotat prosperous; but it has little other trade, that which it has being confined to the necessaries for its working population, which are brought in boats, and to the fishery, which is active. La Ciotat suffers from an irremediable geographical misfortune. It is shut out from the rest of Provence by a barrier of hills behind it, and there is no open valley through them to make communication easy. The land immediately about the town is an arid desert, with nothing but poor grey olive-trees on the grey rocks.

M. Lenthéric has an interesting chapter entitled "Une Ville Gréco-Romaine disparue," in which he gives an account of the vanished city of Tauroentum. The position which it occupied appears to be known with certainty, though the remains are scarcely perceptible above the surface of the ground. Excavations undertaken at different times have fixed the position of the city in a bay called "Le Golfe des Lèques," between La Ciotat and Bandol. Unluckily the movement of the sand has always buried what had been laid open by digging, so that the antiquary has to trust to the accounts of his predecessors. The peasants destroyed what they could, using the place as a quarry, as they always do use such remains when they have an opportunity. M. Millin, of the Institute, who resumed the diggings at the beginning of this century, came to the conclusion that the ruins were only those of a very important and magnificent villa; but a subsequent explorer, the Abbé Magloire Giraud, did much to bring the lost city to light; and M. Lenthéric gives a summary of these studies and explorations. The place appears to have been originally the site of a Greek colony independent of Marseilles. Afterwards it became a Roman watering-place, probably of considerable splendour, if we may judge by the quantities of precious marbles and mosaics and fragments of colonnades which have been discovered there. Nobody knows precisely when Tauroentum ceased to exist, but M. Lenthéric gives some reasons for supposing that it may have been about the eleventh century.

The little known *pays des Maures*, a hilly region between Hyères and Fréjus, seems to be worth exploring, especially for artists, from the rich abundance of fine rocky and sylvan scenery. The soil is granitic with quartz and serpentine, and the rocks are grey or rose-colour, often glittering in the sun, whilst the sands are remarkably fine and beautiful. M. Lenthéric goes so far as to say that the vegetation is probably the richest in all Europe, and certainly the most varied. The heights are crowned with pines, ilex, cork-oak, and magnificent chestnuts. Lower down the hills of a moderate height are planted with vines and olives, whilst the bottoms of the valleys are rich in fruit-trees, in flowering shrubs, and in odoriferous plants. The arbutus, the pomegranate, lavender, myrtle, mastic-tree, cytisus, and "great heaths almost arborescent" are scattered in profusion. Here is a description of the bay of St. Tropez, the ancient Sambracitanus Sinus, which enters like a salt-water loch into this beautiful region:—

> Le golfe de Saint-Tropez, en particulier, qui s'enfonce profondément dans le cœur du massif des Maures, est à lui seul un pays complet avec ses montagnes primitives, ses masses plutoniques de serpentine, ses buttes volcaniques, son fleuve en miniature et sa plaine d'alluvions. C'est une véritable terre promise qui porte au plus haut degré le cachet de l'Orient; et les Arabes qui l'ont occupée au dixième et au onzième siècle ont pu réellement s'y croire dans leur pays d'origine. Comme dans certaines vallées fertiles et tempérées de l'Asie Mineure, les ruisseaux coulent entre deux haies de lauriers roses aussi serrés que les oseraies du grand Rhône; les orangers et les citronniers vivent en pleine terre; les arbres à cédrats y produisent des fruits d'un volume extraordinaire; les palmiers eux-mêmes ne se contentent pas de projeter leurs tiges élégantes et donnent quelquefois des dattes aussi savoureuses que celles des oasis de l'Afrique et de la Syrie.

Some of the valleys of this favoured region, "all but unknown," are protected in winter from the cold north winds and refreshed in summer by cool damp breezes from the sea. M. Lenthéric speaks of it as "ce pays sans pareil," and yet, by one of those contrasts common in Provence, it is close to the rude country of l'Esterel, which M. Lenthéric calls "ce pays âpre et désert," a country of wild rocky hills with naked crests admirably described in the eighth chapter of this volume. Then you come to Cannes, that singularly favoured spot, where the temperature does not go down to freezing point and does not rise so high as in the northern cities of Europe. De Saussure described it in 1787 as a wretched hamlet inhabited by a few sailors. Lord Brougham discovered it in 1831, and, what was much more, discovered its merits and made them known. The best proof of the extraordinary mildness of the climate at Cannes is the wonderful variety of its vegetation, strikingly described by M. Lenthéric in the following paragraph:—

> A Cannes, plus que partout ailleurs sur la côte de Provence, les végéta- [illegible] sujets les plus disparates. La plaine est couverte d'orangers et de citronniers, au milieu desquels émergent de distance en distance des éventails de palmiers et des tiges d'aloès; les coteaux sont couronnés de pins parasols dont les grandes têtes majestueuses rappellent les sites classiques de la campagne romaine; le fond du tableau est tapissé de forêts de pins noirs et serrés, semblables à une draperie sévère au-dessus de laquelle se profilent les lignes pures des Alpes rayonnantes dans leurs neiges éternelles; et l'on voit ainsi groupés dans le même cadre les grands conifères du Nord, les oliviers de la Provence, les fruits dorés et embaumés des Baléares, les lauriers-roses de l'Asie Mineure et les végétaux épineux du Tell algérien.

ASHWELL'S LIFE OF BISHOP WILBERFORCE.*

THE reviewer's difficulties are at their greatest when he has to handle the unfinished biography, by an author who can write no more, of a man still a contemporary, although dead long enough for many most important things, in which he would have been foremost, to have happened since his death, while his claim on the regard of posterity had been a life of continuous action and various progress. One book, one campaign, one discovery may sometimes have made a man's entire popular fame, and so the memoir which includes or excludes that single event will or will not be his sufficient record. A Life of Gibbon which stopped short of the *Decline and Fall*, of Robert Lee which ended before the Virginian campaign, or of Jenner which closed with vaccination undiscovered, would be simply useless, except perhaps to the special student of character, and, with such limited usefulness, could be easily handled. But with Samuel Wilberforce life was a constant series of events, larger or smaller as it might happen, locking into each other and producing a result large in its complexity, and better measured by its effects upon others than by any definite production. No single book, or speech, or Act of Parliament, or institution stands forward as his specific claim for remembrance; but, while the whole Church of England, in its efficiency and in its tone, is different from and better than it used to be within living memory, a great proportion of this improvement is due to the work of Bishop Wilberforce. At the moment of his death we tendered our estimate of Bishop Wilberforce as a Churchman†, and to what we then said we adhere. We gave the picture of the active, powerful Bishop as he presented himself in our own sight. Of this article we shall only quote a single sentence written as it all was only four days after the Bishop's death:—"The fact that he had worked himself into this position out of the ranks of the 'ci-devant' Puritan (and now Evangelical) party, to

* *Life of the Right Reverend Samuel Wilberforce, D.D., Lord Bishop of Oxford, and afterwards of Winchester.* By A. R. Ashwell, M.A., late Canon of Chichester. Vol. I. London: John Murray. 1880.

† *Saturday Review*, July 26, 1873.

which he had belonged in days when it seemed to represent the deepest popular earnestness, was in reality an element of strength, saving him as it did, on the one side, from conventionality, and on the other, absolving him from having to gather at second hand the opinions of those he was refuting." We regard this broad fact as the key to the Bishop's whole history, inclusive, we may add, of the asperity with which he was so often pursued by those who considered him as a deserter from their side; so we desire now to place it in renewed prominence. We have some dread indeed that the very completeness and minuteness of the facts which Canon Ashwell narrates, to a great extent by an able and laborious interweaving of the Bishop's own letters, may obscure its significance; so we are still more emphatic in its reassertion. At the same time we believe that, owing to that same minuteness and to the fairness of the biographer, we shall be able to make our point good out of the materials which he himself has purveyed, in spite of the inherent difficulty of proving a case from the brief of another party. We are certain not only that we are the best friends to the memory of Bishop Wilberforce by taking this way of dealing with his earlier clerical life, but that we should be very bad friends to many other universally respected men if we evaded it. To put the case plainly, if Samuel Wilberforce was, down to 1848, the type of a consistent Anglican High Churchman, more persons than we dare to recapitulate, from John Keble and Bishop Phillpotts to Dr. Hook and Professor Mozley, would have found it difficult to vindicate their claims to that character.

His conscientiousness was, we are sure, not inferior to theirs during that period; but it was a conscientiousness which led him to think, to speak, and to act, in a way widely different from their words and deeds. For Bishop Wilberforce in his later phase we have, as we expressed in that article, a genuine and broad, although discriminative admiration, and we repeat our conviction that we are paying the most friendly tribute as well as doing the truest justice to his memory when we endeavour within our narrow limit to show how much space he must have traversed in that little span of time to reach the level which he will occupy in the eye of posterity. The earlier years of his episcopacy already go back beyond the birth of many who claim to be heard on grave concerns of Church and State, and to some of these it may now come as a surprise to learn the process by which the really great Bishop of Oxford and Winchester grew out of an energetic, picturesque, lovable, clever, but not quite great Archdeacon of Surrey and Dean of Westminster. The fact fairly faced really makes for Samuel Wilberforce's greatness, for to grow in opinions is no discredit to any man, although, if he is wise and tolerant, he will not reckon consistency in his own old views on the part of other men as an unaccountable, if not indefensible, mystery of Providence.

The position from which we make our survey is that every definite and progressive High Churchman during the period in question must have been more or less a Tractarian. It is probable that they are now sufficiently ancient for persons in general to have but a misty idea of what the *Tracts for the Times*, or, as they were commonly called, the "Oxford Tracts," really were, and the present generation may therefore be ill able to appreciate the vagueness of that illusive appellation "Tractarian" applied to persons who were supposed to favour the views set out in that series. The Tracts were ninety in number—the first of them published on September 9, 1833, and the ninetieth on February 2, 1841. The shortest was four pages in length, and the longest 398; and the character of the compositions varied from the simplest expositions, adapted to rustic comprehensions, to very abstruse theological tractates, while some of the most noticeable were reprinted essays, or *catenæ* from standard Anglican divines, marshalling their views in chronological order, both as cumulative arguments upon their respective subjects and as evidence that the Tract writers, whether right or wrong, were so in company with divines of acknowledged authority as leaders of what is now known as the Historical High Church party. In putting these *catenæ* forward as portions of the series, their editors claimed for them an authority at least equal to the tracts of original authorship. A series so diversified, and running on for so many years, naturally covered the largest portion of the field of ecclesiastical literature; but there was one topic upon which the Tracts were from first to last what would now be called inconceivably silent—the ceremonial of worship. So far did this indifference go that, in one which minutely compared the first and second Prayer-Books of Edward VI., not the slightest reference can be found to the difference of the vestures prescribed by the two formularies. Yet one of the Tracts, which gave most offence to gainsayers, was a minute account of the Breviary, only differing from that which filled several columns of the *Times* a few days since in being decidedly less complimentary. A Tract by Dr. Pusey, the bulkiest of the series, on "Scriptural Views of Holy Baptism," published at the close of 1835, had a hot reception; but rather from the sternness of its doctrine than from any imputation of Popery. Much unpopularity was also incurred by a very ingenious essay, which appeared as late as 1840 (No. 87), by Mr. Isaac Williams—which would certainly have, with more prudence, been issued as a separate personal publication—on "Reserve in Communicating Religious Knowledge," in which temperate and sensible warnings against the prevalent irreverence of the age were unfortunately mixed up with and illustrated by an apology for that "Disciplina Arcani" which the Primitive Church, beleaguered and persecuted by Paganism, adopted in self-defence. It was as easy as it was unfair to distort this tract into a defence of disingenuousness and falsehood, and the prototypes of the *Rock* did not miss their opportunity. Then came the famous Tract 90, by Mr. Newman—which probably stands to this generation as the whole series of Tracts—offering an interpretation of the Thirty-nine Articles which would undoubtedly raise much controversy, but hardly persecution, in the present day.

Such were the Oxford Tracts, of which it is not too much to say that, placing Tract 90 in a category of its own, and admitting the sternness of Dr. Pusey's view of post-baptismal sin, and the inopportuneness of Mr. Williams's vindication of the "Disciplina Arcani," and taking note of a tendency in one or two discussions to a mystical interpretation of texts, the series, as a whole, would be accepted and justified, we do not say by the men who boast of being Ritualists, but by that body of divines from which Mr. Gladstone and Lord Beaconsfield make their selection when they desire to appoint a bishop or a dean agreeable to the High Church party.

A considerable portion of the unpopularity of the Tracts at the time of their publication was due to the anger which they aroused, not among Low Churchmen, but among the ranks of the then old High Church party—the "High and Dry," as they were called—who felt that the plain-speaking of these young men was a reproach to their own laziness and ignorance. But a Churchman who was neither High and Dry nor yet Evangelical, and who called himself a High Churchman, must by the nature of things have been a Tractarian up at least to the extent which we have striven to point out, and with every reserve of confidence in particular men. He must have been so, and shown that he was such by his conduct. That is, he must, at least, have acted as Dr. Hook did. This, then, is the test by which we desire to try Mr. Wilberforce's theological position during the Tractarian and post-Tractarian epoch, presuming that the more abatements we may find in the claim set up for him of having been a genuine High Churchman, *i.e.* quasi-Tractarian during that period, the more remarkable do we estimate the position which he was able to take up in his later career. If we were to seek from our present cast of Church parties for a type of Church opinions which would most accurately represent those which were promoted by the Rector of Brightston, Archdeacon of Surrey, and Dean of Westminster, we should say that they bore considerable affinities to the system of Church policy advocated in the pastoral issued shortly after his consecration by the present Bishop of Rochester. They were eclectic upon a Low Church foundation but with High Church accretions, enhanced in Mr. Wilberforce's case by his consistent belief in Baptismal Regeneration, a doctrine which, to our surprise, he states in one of his letters had always been held by his father. We do not pretend to guess what would have been the future of the Church of England if there had at that period been any considerable party agreeing with Mr. Wilberforce. As it was, his nearly peculiar attitude was a cause of real injury to the men whom (with a totally impossible exclusion of "Tractarians") he at the time believed himself protecting. The truth is, that all through that crisis the Tract writers were both misrepresented and cruelly used, not so much by the Evangelicals, who were consistently and conscientiously bound to oppose them, as by a worldly, selfish section of "High and Dry," who coldly assented where they ought to have gratefully accepted, and who hedged every grudging instalment of intellectual agreement by vindictive and unfair handling of the men who were in trouble. How many of the body shook off the chilling influence of their unworthy companions, those whose memory carries back so far will easily recollect. Enough, however, took the less worthy part to do great mischief to the Church of England.

The Tractarians undoubtedly acted with very great imprudence on some occasions, for they were young and they were provoked into unjustifiable retaliation. We are not referring to such incidents after the cessation of the Tracts as Mr. W. G. Ward's monstrous swagger about accepting the Articles in a non-natural sense, and Mr. Oakeley's claim as an English clergyman to hold all Roman doctrine. But so early as the end of 1837 even such men as Mr. Newman and Mr. Keble committed an act of reckless impolicy in publishing without due excision the "Remains" of R. H. Froude. The book was far from establishing any bias on the author's part towards joining those whom, as his own exclamations show, he got to think worse and worse of, and whom at last he called "wretched Tridentines everywhere." But that knowledge of human nature with which one at least of the editors was abundantly gifted might have hinted to them that the language in which the writer indulged about the characters and the motives of the Reformers was wholly unsuited to the people at whose heads it was projected. The men of that day indeed would probably have been infuriated at such a biography of Cranmer as the one published in later times by the model Anglican, Dr. Hook; but so much the more reason not to have pelted them with Froude's hard sayings. It was a curious complication of ill-luck that the very leaders who were so soon destined to be abused for their advocacy of the "Disciplina Arcani" should have got the Church of England into such troubled waters by so flagrant an instance of unreserve in communicating religious knowledge.

This has been a very long prelude, but it will much shorten the practical application of our consideration of Mr. Wilberforce's history, as to whom we are constrained to say that his eclectic course had an unfortunate proclivity for working to the disadvantage of the persecuted Tractarians. They had, indeed, no right to expect support from the relation, the nominee, and

the intimate friend of Bishop Sumner of Winchester, and equally the relation and (though not so intimately) the friend of Bishop Sumner of Chester, who made himself conspicuous by attributing the Oxford Tracts in one of his charges to Satanic influence. When he had become Archbishop of Canterbury, and Dr. Wilberforce was Bishop of Oxford, their relations were very different. But then Bishop Wilberforce had become in reality a High Churchman.

Canon Ashwell's unconscious evidence to our position is the more valuable because he had clearly entered upon his work with the fixed idea that the Bishop had always been a High Churchman. Very early in it (p. 54) he says, under date 1830, but in a synoptical passage:—"He was a Churchman and a High Churchman from the first; men like Mr. Hurrell Froude were among his intimate associates; he repeatedly expresses the keenest admiration for the intellect and powers of John Henry Newman." On this we may remark, that we trust that intellectual admiration of Mr. Newman's powers is no proof of theological bias in one direction or in the other. Besides, during all the period of Samuel Wilberforce's University career Mr. Newman was himself only in a state of progressive emergence from Evangelicalism. In the *Apologia pro Vitâ Suâ* (pp. 76-77) he says of Mr. Keble:—"At the time when I was elected Fellow of Oriel he was not in residence, and he was shy of me for years in consequence of the marks which I bore upon me of the Evangelical and Liberal schools. At least so I have ever thought. Hurrell Froude brought us together about 1828." As to Froude himself, Mr. Wilberforce's estimate of him, when the publication of his "Remains" had revealed his innermost thoughts, partook more of what Canon Ashwell, in the sentence before the one we have quoted, calls "freedom of criticism" than "balance of judgment." The third-named associate, Mr. Frederick Oakeley, who still lives to show that a convert can be tolerant, himself began as a very low Churchman, while, indeed, we believe that the suddenness with which he assimilated the High Church view was a cause of somewhat amused surprise to his Oxford friends. As early as January 1834, in a letter to his brother R. I. (afterwards Archdeacon) Wilberforce, while terming Newman's *Arians* "a glorious book," and adding, "I have never read any except 'The Christian Year' and Bishop Butler which gave me such purely intellectual gratification," Mr. Wilberforce finds in it remarks on preaching which are "likely to be *very* (*sic*) injurious," and a quotation from one of the Epistles to the Corinthians "entirely misrepresented," while he taxes the work with "a dangerous spirit often visible, something of harshness," and discovers "a lowering view of doctrine, connected with, and in him justified by, high poetical feelings and holy habits, all of which, I think, make it very dangerous." When Mr. Wilberforce wrote this his sympathy with the High Church movement, as represented by Mr. Newman, was probably at the highest, and the subject-matter of the book so severely criticized was that one of its author's earliest publications which most completely removes his readers from the harassing conflicts of Rome, England, and Geneva to the great struggle of the Primitive Church for the Orthodox Faith. In a letter of rather more than two years' later date, April 1, 1836, he talks to his lady correspondent with enthusiasm of "some very long conversations" with Newman on deep religious subjects "as really most sublime as an exhibition of human intellect," in which the same tendency to limit sympathy for Mr. Newman to his intellectual side again makes itself visible. In the same letter Mr. Wilberforce records the death of R. H. Froude as that of a "mighty intellect," adding that "he was, I think, upon the whole, possessed of the most original powers of thought of any man I have ever known intimately." In another letter to a different friend of two months later, Mr. Wilberforce calls a[illegible]ention to the two first volumes of his *Tracts for the Times* w[illegible] the remark that the "view of Baptism" seems to him "pushed to[illegible] far." Advancing a year and a half we find the following sig[illegible]cant passage from Mr. Wilberforce's diary, in which he alw[illegible] talks with thorough unreserve, under date November 24, 1837, [illegible]hich we give with his own italics, premising that the bisho[illegible]med is his own relation and chief, the Low Church leader, Sumne[illegible] Winchester:—"Bishop's letter with my Southampton sermon[illegible]rplexed. I am in a false position with him. I do *not* hold wha[illegible]e *rightly* dislikes in Pusey and Newman, &c., and hardly kno[illegible]how to disavow *this* without seeming also to disavow what I *do* h[illegible]d, being more High Church in *feeling* than he is." We need har[illegible] pause to point out how little was then involved in being "more High Church in *feeling*" than Bishop Sumner of Winchester.

At the end of 1837 came the unlucky publication of Froude's "Remains," of which Mr. Wilberforce says that he fears "they will do irreparable injury." Certainly with him they seem to have markedly, and, considering his views, naturally, strengthened the anti-Tractarian bias. In January 1838, writing to a friend who was obviously defending the Tracts, he has "*some fears*," of which the "principal" are that they "will lead to the depression of true individual spirituality of mind." By March 25, 1838, his indignation at the revelation of the inner mind of R. H. Froude—his "intimate associate," according to Canon Ashwell, and whom he himself says he had known intimately—"contained in the published journals," reaches such a pitch that in his own journal he says:—"They are most instructive to me, will exceedingly discredit Church principles, and show an *amazing* want of Christianity, so far. They are Henry Martyn unchristianised."

In July 1838 a purely personal event occurred which clearly hurt Mr. Wilberforce very much. Mr. Newman declined to accept further contributions from him to the *British Critic*, because, in his words, "to say frankly what I feel—I am not confident enough in your general approval of the body of opinions which Pusey and myself hold, to consider it advisable that we should co-operate very closely." Mr. Wilberforce, in a letter of a few weeks later to his friend, the present Sir Charles Anderson, remarks:—"Newman has just, very kindly towards me, but, as I think, very unwisely, declined receiving more articles from me in the 'British Critic.'" Considering that the *raison d'être* of that Review was being the organ of the then High Church party, as understood by the Oxford Tractarian leaders, and presuming that Mr. Wilberforce's opinions were no secret to Mr. Newman, we think him fully justified as an editor in what he did. In whatever periodicals Mr. Wilberforce might appropriately write, he was clearly out of place, however brilliant as an author, in one which took its keynote from Mr. Newman.

In 1839 we read, in reference to a new volume of Mr. Newman's sermons, "Their tone and standard magnificent, for holiness and separateness from the world, but I think too little Evangelic." At the same time, in evidence of the eclectic position which, as we contend, Mr. Wilberforce intentionally filled, a large portion of the summer of 1839 was occupied by a speaking and preaching circuit for the Propagation of the Gospel Society in Devonshire and Cornwall, timed so as to coincide with Bishop Phillpotts' Visitation tour. At the end of that year he became Archdeacon of Surrey.

The time was now hurrying on when churchmen had to show, by something more active and public than letters and notes in journals, whether they were for or against the *Tracts for the Times*. Tract 90 appeared in January 1841, and the era of active persecution began. In the late autumn of the same year an acrimonious contest for the Poetry Professorship at Oxford was imminent between Isaac Williams, a good candidate though unwisely recommended for the chair on the ground of his being a High Churchman, and Mr. Garbett (afterwards Archdeacon of Lewes), started against him as a Low Churchman, in which Archdeacon Wilberforce ranged himself so vehemently on Mr. Garbett's side as a protest against the Tractarians, that he resisted as unfair to his candidate a suggestion proceeding from Mr. Gladstone—at that time (though Canon Ashwell omits to notice it) in Sir Robert Peel's Government as Vice-President of the Board of Trade—to avoid a contest by withdrawing both candidates. A private comparison of promises, we may observe, showed that Mr. Garbett was certain to win, and so Mr. Williams retired. The significance of this action of Mr. Wilberforce, as marking the place he was then desirous of taking among Church parties, cannot be minimized, for Mr. Garbett was a strong Low Church partisan, and his opponent for a post of literary honour—not of theological teaching—was not Dr. Pusey, nor Mr. Newman, nor his co-editor of Froude's "Remains," Mr. Keble, but only Mr. Isaac Williams, of whom the worst that could be said was, that he wrote the much abused Tract on "Reserve." This significance is increased by an incident which occurred shortly before—we do not refer to Archdeacon Wilberforce's support in 1841 of the ill-conceived Jerusalem Bishopric project, for that was countenanced by a section of pronounced High Churchmen, including Dr. Hook, so we do not insist on the fact. But referring to the same year, and quoting Canon Ashwell, "Through life Samuel Wilberforce and Walter Farquhar Hook were fast friends, but when in April 1841 the Vicar of Leeds, exasperated by some manifestations of factious opposition, published a letter to the Bishop of Ripon [Longley] in which he urged that the time had come for High Churchmen to act together *as a party*, Archdeacon Wilberforce could write as follows to his friend [now Sir C. Anderson], who approved it: . . . 'Hook's letter pained me deeply. It is the very opposite of his own "Call to Union," and it seems to me really quite dreadful that he should avow that he thinks it a *duty* to split into a party.'" We are thoroughly convinced of the absolute sincerity and earnestness with which Archdeacon Wilberforce wrote this; but, in the very proportion of such conviction, we must be allowed to demur to the claims to have then been a High Churchman preferred in behalf of the divine who could write this in the critical year 1841, just after the four tutors and the Heads of Houses had mustered their forces against Tract 90, and who could, later on in the same year, insist on Mr. Garbett going to the poll against Isaac Williams when an amicable compromise was in question. We do not—as we must again explain, for fear of appearing harsh or unjust towards Archdeacon S. Wilberforce—contest his claim to be recognized as representing an eclecticism in which there were many High Church elements; but he abdicated the position of absolute High Churchman in calling Dr. Hook's rally to form a High Church party "dreadful," and then in joining the Garbett party move. We could strengthen our position by quoting some doctrinal statements, but we confine ourselves to overt actions.

Contemporaneously with the election to the chair of Poetry, Bishop Sumner of Winchester was charging against the unfortunate Tractarians in language which elicited this comment from his Archdeacon in his journal:—"Bishop most kind; but *cheu* too little *Church* in his conscientious opposition to Tract errors. Tendency of this must be to form all into 2 sects: one 'Anti-Church,' the other, 'Tract' instead of Church-anti-Tract versus Newman." Here it will be observed that the antagonist set up to be discomfited is not Tract 90, or any other of the series, but the series itself in its entirety; and, as we contend, repudiation of the Tracts in their entirety could be ill distinguished from re-

pudiation of High Churchmanship as a consistent system, although even a very clever man might persuade himself that it was compatible with an inconsistent system of personal eclecticism.

We must hurry on to 1845 and the double vendetta on the part of the Convocation of Oxford with which it commenced, of the condemnation of Mr. W. G. Ward's *Ideal of a Christian Church* and his own degradation from his degrees of M.A. and B.A. That book, with much beauty and instruction in many passages, was, as a whole, clearly indefensible as the teaching voice of an Anglican clergyman. But the combined persecution of man and of book, intended, as it was, by its contrivers to put down Tractarianism at Oxford, was one of the not very remote causes of a recoil by which something very different was set up in the same University. The Heads of Houses originally devised a third and still more monstrous proposal—namely, a new test, whereby all who subscribed the Thirty-nine Articles were henceforward, in Canon Ashwell's words, to do so "first in that sense in which *they* [the subscribers] *ex animo* believed them to have been first put forth, and, next, in that sense in which the *University* now proposed them for signature"—a claim of infallibility just a quarter of a century antecedent to the Vatican Council. Archdeacon S. Wilberforce keenly exposed the absurdity of this suggestion in a letter to his brother Archdeacon R. I. Wilberforce, and threw out as a proposed substitute a simple anti-Roman declaration; yet in a later letter to his brother he says, in reference to the unlucky proposal:—"*But* I feel that something is necessary to defend integrity of subscription; and, if nothing else can be devised, I am far from certain that I shall not support this. I am clear that, as at present advised, I cannot vote against it." Fortunately there was enough of common sense in the dominant powers of Oxford to cause it to be dropped. But the condemnation of the book was carried in the Convocation by 776 to 386, and the degradation of Mr. Ward by 569 to 511. Dr. Hook, Mr. Keble, the present Bishop of Salisbury, and Mr. Gladstone, were among those who voted in the minority on both consecutive occasions, and Dr. Tait voted for the condemnation, but against the degradation. Archdeacon S. Wilberforce voted both for condemnation and degradation. The impolicy and injustice of this vindictive proceeding were well defined by anticipation in a letter addressed to Archdeacon S. Wilberforce while the matter was still under debate:—"The question is concerning the theological character of the University. Laxity of discipline, though deplorable, is intelligible, and is distinguishable from a state of indifference; but if these reins are to be drawn tight, what shall we say if the relative proportions of heresy and inferior error are to be inverted? The University is bound to defend its lawful tests; but yet more to defend the Faith." These are the words of Mr. Gladstone; his letter is addressed from Hawarden, and is dated December 29, 1844—that is, the thirty-fifth birthday of the writer, the actual central day of his whole life so far as it has run between that of his birth and that seventieth birthday of which we lately heard so much, and on which a specimen of a similar judicial and tolerant calmness would have been so refreshing.

The year 1845 witnessed before it ended the secession of Mr. Newman and some of his friends. During it also Archdeacon S. Wilberforce, after a short tenure of the Deanery of Westminster, was consecrated Bishop of Oxford. Canon Ashwell's history of that memorable and noble episcopate only extends to the close of 1848, just taking in the Hampden trouble. We shall have something more to say on this part of his volume.

THE SHAH AGAIN.*

IT would be interesting to know what the people of Persia think of the writings of their ruler. Do they buy and praise them as the people of some Western countries praise and buy royal diaries? Or do they sniff the sniff of the mocker and the critical person? To European readers the Shah's diaries seem harmless anachronisms. In the tiles of his native land we often see representations of a mild, weary-eyed king riding gently through fields bright with tulips, while a conventional buck jumps away from the languid sportsman. The Shah's new Diary is rather like these tiles done into English prose. Whenever he has a chance he falls to writing about the flowers in the fields where he passes. His pages are *semés*, so to speak, with tulips and hyacinths. The bucks ran away from him, too, in the woods of Baden, where, as we shall see, his success as a sportsman gave equal pleasure to himself and to the humourists in his train. He has to write, of course, about other matters—machinery, railways, picture galleries, the Paris Exhibition, the hospitalities of Emperors and Presidents. It was to see these curiosities that he rode, and drove, and entrusted his sacred person to trains and steamboats. He moves out of his quiet country, he rides along roads that run between the flowers and the snow, and he passes into the fairyland of the West. But its prodigies of mechanism do not surprise him; he takes everything on the same level, and is as much interested by a pretty girl rowing on a lake in Paris as by the manufacture of rifles and cartridges. Circuses and the feats of acrobats excite him more than most things; and throughout he manifests a deep abiding joy in the consciousness that he is Shah of Persia. His Diary is like the diary of a laborious and not very shrewd child, and we are as glad to reach *finis* as the wandering monarch was to arrive at Teheran.

It was in the year of the Leopard 1294, on the last day of Rabbi 'ul avval, that the Shah set his face to the West, and, with a retinue of tent-pitchers, horsemen, and charioteers, made for the Russian frontier. His progress must have been picturesque enough, and it would have been pleasant to see his encampment glittering in some meadow, lying beside an ice-cold river, between mountains, "red, yellow, green, and violet-coloured." The Shah seems to like nothing better than the view of a peaceful landscape; that is his contemplative recreation. Here is a description of the banks of the Danube, into which he has put more feeling than usual:—

> The steamer continued her course down the river until we completely lost sight of the city. The country here is well wooded, and the river-banks are grassy and full of flowers. The trees resemble willows, and not being very high, permit air and light to enter freely into the forest. The leaves of the trees were beautifully green, and looked as if they had just been washed. . . . . I heard not a sound, except occasionally that of a little bird singing sweetly, as he skipped from tree to tree. Going down the river we could hear at intervals the cry of some black geese and falcons, accompanied every now and then by the noise of a steamer. If it had been in my power I should have liked not to have returned to the city at all, but to have continued the voyage as far as Buda-Pesth, the capital of Hungary.

He does not journey with his eyes shut to mere scenery, like St. Bernard, who travelled for a day beside the Lake of Geneva without even noticing the existence of what the Americans call "the handsomest of the Swiss lakes." The view of the Gokcheh is thus described:—"The lake looked very pleasant with its clear and dark blue slightly rippling waters, which are sweet, and harbour a good many trout." One would like to wet the "Harriet" and the "Professor" in the dark blue slightly rippling waters.

On crossing the Russian frontier, the Shah found himself warmly welcomed everywhere, especially by the Mussulmans and Armenians. We seldom hear, on good authority, how monarchs like being mobbed and cheered. The Shah obviously likes it; he does not even much mind listening to the "addresses" of provincial mayors. In Moscow, he says, "the delight of the people was great, and, as we passed, there arose tremendous cries of 'Hurrah!' and an indescribable shouting; verily, it must have been from excess of pleasure, and quite spontaneous." The Nihilists, it seems, do not count the Shah among the crowned heads with whom they wage war. In Russia the circus was perfection, and the Czar was immensely kind and hospitable:—

> The Emperor and all his sons, and the other princes and nobles, came to our rooms half an hour before the appointed time. With great amiability and kindness they accompanied me through the many salons to the private rooms of the Emperor. We had a long conversation, and then, accompanied by the Emperor, went to the apartments of the Empress. We sat down a little, and after some friendly conversation we rose. As my paletôt was not ready when we reached the foot of the palace stairs, the Emperor threw his own over my shoulder. I put it on, and said: "Now that I wear your paletôt I am sure that my journey will be an auspicious one." The Emperor and I then entered an open carriage and we left.

In Germany the Shah arrived just in time for Nobiling's attempt to murder the Kaiser. "Praise be to God that the helmet was on his head, or he could not have escaped; the whole of the helmet was riddled with shot." Though sincerely sorry for his host, the Shah was not much moved by this event. He either did not speculate on Socialism at all (as an intelligent Oriental should have done), or he kept his ideas to himself. This is the weak point of the Shah; he declines to look at things from an Oriental, or a Royal, or a Moslem, or any other unusual point of view. He simply follows the advice of Mrs. Gamp, and "takes things as they comes, and as they goes." We defy analysis to get any particularly Eastern ideas out of his book; or, for that matter, any ideas at all. One might as well ask a panorama for ideas.

The Shah is most amusing as a sportsman. He does not seem to be a very quick shot; at least the Baden deer are too fleet for him:—

> The keepers again pointed out a suitable spot, and again we stood still. They and their dogs beat the bush, and I was standing somewhat below looking out for a shot, when suddenly the dogs began to bark, and a buck passed me like lightning. I then quickly went a little higher, and another buck came past. He ran very swiftly, and the branches of the trees also prevented my seeing him properly. I fired, but did not hit him. . . . . We saw some more bucks grazing in the middle of an open space, but they caught sight of one of the beaters and ran off; I fired with a bullet, but missed. Tired and in great perspiration I entered the carriage, and went home.

On another occasion, after the Shah had fired vaguely at the place where he supposed the deer might be, two fine bucks were brought to him as the spoil of his rifle. "All were greatly astonished. I perspired much," he says, and, indeed, he seems to have been always perspiring. At pigeon-shooting, however, he was more than a match for the Giaours, who were either excellent courtiers or execrable shots:—

> A little lower down lies the pigeon-shooting place, a long wooden pavilion, in which we sat down. The Russian minister at Baden, some other personages, a tall young man named Metternich, who was one of the pigeon-shooters, and the officers from Baden, were there. The shooting began. A person sat on a chair having before him a contrivance connected underground with the pigeon-boxes. On the ground, at the distance of about thirty paces from him, stood about ten boxes, and in each box had been put a live pigeon. The person who intends to shoot stands in front of the man, and aims at a box. When he says "Pull," the man knocks an instru-

* *A Second Tour in Europe.* By the Shah of Persia. Translated by Albert Houtum Schindler and Baron Louis de Norman. London: Richard Bentley & Son. 1879.

ment looking like a pestle to the ground, one of the cage-like boxes immediately opens, a pigeon flies out of it, and the sportsman quickly fires. The Europeans shot first. Whatever they fired at they missed, although the distance for the shot to travel was small; we had to shoot with small shot. I then fired four shots, one after the other, and did not miss once. Mehdí Qulí Khán and J'afer Qulí Khán, the chief page, also hit. The Europeans altogether made only a single hit.

The Shah is as clever with the spear as with the "shot-gun." At the museum at St. Germains he and his friends threw spears at a mark, both from the hand, like the *jerid*, and with the throwing-thong or *amentum*. The Europeans present only threw some twenty paces:—

I then threw one, simply by force of the arm and hand, and it went to a distance of a hundred paces, and I have thrown even further than that. . . . It is the custom in Persia to practise throwing the jerid—which the French call javelot—and I have had much practice in throwing it, and for that reason I was enabled to throw the spear so far; it is less a question of strength than of skill.

At the museum the Shah was shown many prehistoric implements; he refers them to a period anterior to, or contemporary with, the Noachian deluge.

In Strasburg he was struck by the "sorrowful faces" of the people. In Paris the Exhibition and the manners of the cabmen divided his attention. "If I wished to write a description of the Exhibition," he says, "I should have to find a book the size of the Sháhnámeh and write from now until the closing of the Exhibition every day for twenty-four hours without ceasing, and even then I should only have written a tenth or hundredth part of the description, and many things I should not be able to describe at all." The Shah, therefore, abandoned his ambition to write a catalogue and to rival Mr. Sala's descriptions. He went to see his dentist, and we learn, with respectful sympathy, that "Hybennet, at Teheran, had filled a hollow tooth of my left upper jaw; but the filling had become loose, and Hybennet could not get it out; but when Chrétien had worked at it for some days, it finally came out. I was very glad, and am going to have the tooth filled anew." No passage in the Shah's Diary surpasses this one in thrilling personal interest. It may, however, excite Professor Blackie more to learn from the Shah that Scotland is one of the English provinces. As the Shah says so, that opinion must now be generally received in the Persian Empire.

It is not easy, to tell the truth, to get much excitement out of the works of this placid potentate. Even the races at Longchamps (where there was a row because an English horse beat some French competitor) did not move him violently. He learned, however, and he deigns to expound, the nature and uses of the umbrella of the West:—"Every person, man or woman, on leaving the house takes an umbrella in his hand, and the umbrella has three uses; it may be used as a walking-stick, or to shelter a person from the sun or the rain, and occasionally as a weapon to strike another's head." Some old English writers recommend, not striking, but giving the point with the umbrella—a much more deadly practice. Here follows a vignette in the Persian manner, representing the Parisian cabman:—

The coachmen of Paris never have any fixed hours for their repose. I have not yet seen a coachman that keeps awake when not actually moving. Whenever his master or the person who has hired the vehicle goes into a shop, or into a house to visit some one, or stops there a short time, the coachman immediately, and on his seat, falls asleep, and sleeps on till his master comes out again. Every coachman has a newspaper in his hand, but before he can begin reading it, he is asleep.

We might go on making extracts from this panoramic diary. We might tell how the Shah was bored by an old woman at Fontainebleau, and how he thought the people, and especially the children, of Paris very neat and clean, and how he got Marshal MacMahon to come with him to the top of the Arc de Triomphe to watch the fireworks, and how in all Austria he saw not a single ugly or ill-looking person. "What women, girls, and boys! All are excessively lovely, and an ill-looking person means a man or woman either old or naturally deformed." But, when all these things were retold, there would be little left in the book, except enumerations of towns, rivers, and mountains. The Shah travels as a simple sightseer; he scarcely ever even draws an inference; and, as his adventures were commonplace, his infantile record is nearly as dull as it is plain. However, he seems to be rather a good creature, with simple, obvious tastes, and easily pleased, if easily fatigued.

THE FLEET PRISON IN THE SEVENTEENTH CENTURY.*

IN the course of his researches among the historical MSS. at Eaton, Dr. Jessop accidentally came across a volume of writing of which neither he nor Mr. Gardiner was likely to underrate the interest, and which is accordingly, by the permission of its owner, the Duke of Westminster, now printed for the Camden Society. All persons concerned are to be congratulated on the fortunate discovery of a document proving, among other things, that fiction often seems the most grotesque where it is nearest to historical truth. Dr. Jessop reminds us that long before Dickens drew that picture of the Fleet Prison with which readers of our own day are most familiar, Howard's description had been published and his reforms carried into effect, and that the old building described by the philanthropist was burnt down in the shameful No Popery riots a few years afterwards. For that matter, Howard's Fleet Prison itself can only have dated from the re-building of all that part of London after the Great Fire of 1666. And yet it is difficult, in turning over the pages of the curious volume before us, not to be incessantly reminded of the experiences of that friend of our youth, Mr. Pickwick, when, being determined "to go somewhere," he went to the Fleet; of the disturbed night spent by him in the Warden's room, which, as he had satisfied himself "by mathematical calculation," "was about equal in annual value to the freehold of a small street in the suburbs of London," and of "the poor side" of the Debtors' Prison, where was found Mr. Alfred Jingle, ready for the "curtain to drop" over his squalid misery. The Fleet Prison, the demolition of which Dickens had the satisfaction of being able to record in the preface to a later edition of his famous book, had in its time served to point many a moral and to diversify, if not to adorn, many a tale. (Is Dr. Jessop, by the by, correct in implying that the prison described in *Amelia* was meant for this particular prison?) Its historical life runs back to the extreme limits of the "memory of man," according to the legal definition of the phrase. For Dr. Jessop has found a notice dating from the reign of Richard, which states that the Fleet Prison had been the inheritance of "Nathaniel de Leveland and his son Robert" ever since the Norman Conquest. Robert was succeeded in his office as Warden by his widow, who may be presumed to have resided out of "college"; but beyond a doubt many of their successors had their souls vexed by unruly lodgers within their freehold, and some of the Wardens may in their turn have given *primâ facie* cause for discontent and disturbance, like Richard Manlove (his name is not from a comedy, but from a "true and tragical account" cited by Dr. Jessop) in 1691. But the volume before us is concerned with a rather earlier period in the history of the Fleet, which can at no time have been the scene of more vivacious episodes than those which it witnessed in the year 1619 under the wardenship of Alexander Harris.

That year is well known to have been one of the most remarkable of King James I.'s reign, since in it fell the acceptance by the King's son-in-law, the Elector Palatine, of the fatal Bohemian crown, and the two missions to England of Count Dohna on Frederick's behalf. The King, therefore, during his progresses, had occupation enough for his busy brain in seeking to determine his attitude towards the great European crisis in which he would fain have played the arbiter; but for the Council which he left behind him at Whitehall, there were, as usual, affairs nearer home to settle. Among these, questions of prison management and mismanagement, and of prison disturbances, were evidently fast assuming the character of a chronic nuisance. And indeed, so far at least as the great debtors' prison was concerned, it could hardly have been otherwise in a reign which it would not be going too far to describe as one of the most vicious, most litigious, and most drunken in the history of English society. Further, it will be remembered how the religious policy of Elizabeth's later years had descended as an unfortunate heritage to her successor. Whatever hopes James might have entertained or encouraged as to the eventual mitigation of the Recusancy laws had been exploded by the discovery of the Gunpowder Plot; nor had the day yet arrived when the King, in one of the oscillations of his balancing policy, sought to relieve some of his many Roman Catholic subjects whose grievances had been aggravated by the madness of a few. Thus the Fleet was inevitably crowded with recusants, unlikely to be amicably disposed towards its Warden, more especially when he was a sententious Protestant of the pronounced type of Mr. Alexander Harris. And, religious difficulties apart, this was a time when extravagance, improvidence, and chicanery must have detained many hot-blooded country gentlemen in the neighbourhood of Paul's beyond the business and the pleasure of Michaelmas Term. The date of which we are speaking cannot have been very far distant from that of the production of *A New Way to Pay Old Debts*; nor is this the only work of contemporary literature in which we meet with country gentlemen in the extortioner's hands, and on the road to ruin.

It was in this state of things that, in July 1619, a serious mutiny broke out among persons confined in the Fleet Prison. It had been preceded in the previous year by a personal assault upon the Warden, Alexander Harris, perpetrated by Sir John Whitbrooke, a Shropshire knight of large but encumbered estate, who had been imprisoned for a number of years as a Catholic recusant. Of the facts concerning the assault it would perhaps be hardly safe to accept the account given by the Warden in his *Apologetical Answer*. From this it would appear that the recusant in question was a very bloodthirsty recusant indeed, and that it required the united efforts of the Warden—who, though he had received "fower woundes to the scull and some bruses" to begin with, was "neither wrothfull nor daunted," and kept both his temper and his presence of mind—and of two maid-servants, assisted by the butler and the porter "of the howse," as well as the "goaler" and "others," to subdue him and carry him into the strongest ward of the prison. This place was named Bolton's Wards "for many yeares," as the Warden elsewhere happily observes, "familiarlie soe called as he thinketh of bolts or irons put on them." In this retreat the knight conspired,

with the rest, to surprize the Warden and Officers, and to putt them into the strongest wards or prison, and many other dangerous matters. And

* *The Œconomy of the Fleete: or, An Apologeticall Answeare of Alexander Harris (late Warden there) unto XIX. Articles sett forth against him by the Prisoners.* Edited by Augustus Jessop, D.D. Printed for the Camden Society. 1879.

for more orderly prosecution thereof he named one *Peck* to be King, and a Duke of Yorke and Lancaster was designed, and white and redd roses of horne brought for to make the favourers of each to be knowne; and pick-locks were provided from Newgate by one *John Abell*, who brought them to *Edward Rookwood*, which he concealed from the Warden untill it was revealed by others.

Of the personages who joined with Sir John in playing this ingenious prison game, Mr. Ashburneham Peck was an experienced prisoner of nineteen years' standing, and Edward Rookwood the head of a Roman Catholic family of importance on "Suffolk side," who for religion's sake likewise spent a considerable part of his life in confinement. This obstinate recusant was manifestly a perennial vexation to the Warden, who inveighs against him both on general and on special grounds, as calling himself and being termed "the *Vicarr Generall* of the Romish in the Fleete," and as declining, not only the regular prison diet, but also the payment of the customary fee for the meat brought to him from outside in lieu of it. These and other prisoners raised a tumult accordingly, and "fortified the prison," properly so-called, which appears to have consisted of the main block of the establishment, as distinguished from the better sorts of chambers let out to single occupants. In consequence, the Warden clapped Rookwood into Bolton's Wards, and procured a royal order to himself commanding him to "keep strait such prisoners as were Recusants and came not to Church." Rookwood having complained to the Council, an order was issued which seems to have settled matters on an equitable footing; for the prisoner had to pay 15*l*. to the Warden, and the Warden to put him back into a private apartment. But he was not hereby induced to cease from troubling; he misbehaved in church on the solitary occasion when he perforce made his appearance there; delivered himself out of his windows against the "economy" of the Warden; and, according to that authority, "attempted to seduce the Warden's man (his keeper) to be a Papist, offering him 500*l*. and his daughter in marriage if he would convert." Meanwhile, Sir John Whitbrooke had, probably for cheapness' rather than safety's sake, been removed into lodgings, furnishing every facility for the hatching of fresh disturbances. A certain Boughton, by whom Sir John was destined to be a few months afterwards stabbed dead, was his principal aider and abettor in preparing the great insurrection which, in July 1619, at last established in the Fleet a rival authority to that of the Warden. For three months, or thereabouts, the Warden, according to his own avowal, "had no command" in the main building, "fortified" by the insurgents. Negotiations long proved of no avail; neither the Warden, nor the representative of the City, nor the orders of the Lord Chief Justice, nor those of the Lord Chancellor and his Sergeant-at-Arms, could induce the masters of the "prison" to unblock it; at last the Lords of the Council sent a clerk, who arranged matters on terms at least equally honourable to both parties.

We cannot further pursue the acts and scenes of this curious domestic drama, by a connected statement of which in his Introduction Dr. Jessop would have rendered a great service to many of his readers. Mr. Alexander Harris is so discursive, and at the same time so emotional a writer, that it is not always easy to make head or tail of his exposition of his case. Clearly, however, the "outlaws and Jesuits," which he declares "(almost) all that complayne" against him to be, pressed him inconveniently close outside as well as inside his domain, endeavouring to obtain a verdict against him in two trials at law, and actually obtaining a Royal Commission to take into consideration their grievances. At the same time a suit seems to have been begun in the Star Chamber by the Attorney-General against the ringleaders of the mutiny, and, so far as can be gathered from Harris's preliminary statement, it was in connexion with this suit that the prisoners drew up the Nineteen Articles, repeating what had been verbally attested before the Commissioners on their visit to the prison. To these Articles in his *Apologeticall Answeare* the Warden replies *seriatim* and at length, and thus contrives to furnish a picture of the "Œconomy of the Fleet" which is unlikely to convey to posterity precisely the same kind of impression as that intended by its author.

But the materials are not complete for arriving at any satisfactory conclusion as to the official conduct of Mr. Alexander Harris, albeit he "presumed to hazard the rebuke of his unpollished writeing rather than to leave his innocency unremembered to the world." Neither the occasional unctuousness of his painfully uneasy style ("Who is to me," he oddly exclaims, "that I remayne in Mesechech and dwell in the tents of Kedar"), nor the consistency of his views concerning the dangerousness of all Papists and the fraudulency of most debtors, can obscure the fact that he had a good deal to complain of in his position. Necessity, he confesses, first led him to seek a position in which he looked for *turpe lucrum;* but afterwards he considered the fees and duties of the institution from both a moral and a financial point of view, "examining" their "justness and value." Finally, "when there was noe remedy but he must be Warden, he besought of God to give him an heart answearable to serve the Commonwealth and doe poore men good." Hitherto, he adds, he has "come short in both"; and without entering into the question of the justice and expediency of the Recusancy laws or the laws of debtor and creditor in his age, we must allow that his benevolence towards the "poor men" with whom he was chiefly brought into contact was much hampered by the customs of his office. Thus he defends himself—no doubt truly—against the tolerably impudent charge, "set on foote cheifely by *Sir Francis Inglefield* (or Englefield, the unfortunate head of an old Roman Catholic family, as to whom, and whose troubles and sins, Dr. Jessop has an interesting note with numerous references), that he had robbed the poor men's box of certain fees by altering the word "ward" in the Order of Council concerning them into the word "Warden." But we feel less at ease when he partly rests his defence against exorbitant fees for beds and bedding upon the general defence, that "it is alsoe warrantable by Lawe that the Warden may make the best of his Lodgings within his freehould without contradiction, yet he taketh onely what former Wardens tooke without inhaunceing them in any soart." It is needless to pursue the various squabbles about the prices for food and fuel, or about rents for sets of chambers where gentlemen lived with their families and might (as they occasionally did) dispense hospitality or pursue literary studies, and for less comfortable apartments shared by two or three prisoners. The most curious feature in the whole is a thoroughly English one—a constant desire on both sides to appeal to precedent, coupled with an apparent conviction on the part of each that it is unanswerably in the right.

Dr. Jessop's notes to this most interesting publication are terse and well supplied with references, as becomes their purpose and occasion; but here, as in his preface, he has not erred on the side of excess. With the aid of his references it will, however, be easy further to pursue some curious incidental points in this volume—such, for instance, as the history of the heresies of the "Jewdaiser, or half-Jewe," Thraske (or Traske), which constitute a peculiar outgrowth of Puritanism in its earlier days. As misfortune is said to make strange bedfellows, so the Fleet Prison made strange companions in causing Thraske and the Rookwoods (according to Harris) to talk mischief together against the King's Majesty and the State. Against the "half-Jew" the unlucky Warden must have felt some personal bitterness, inasmuch as he relates that "such hath been the malignity of a sonne of Symonie residing in that place, as to add unto the Nynetcene Articles and peirce above the flesh into the very soule by alledging before great persons, and boasting of it afterwards, that the Warden is circumcized." In accordance, no doubt, with the rules of the Camden Society, the text of the *Apologeticall Answeare* and of the illustrative documents appended is printed in all the wildness of the original spelling; and, as the Warden is anything but chary of repetitions or otherwise easy to be followed, this volume is not altogether light reading. But its reality is more vivid than the skill of historian or novelist could have made it; and Mr. Alexander Harris's floundering pen has contributed in no small measure to our knowledge of English prison history, which in the seventeenth, as in some other centuries, formed no unimportant part of English history in general.

LIFE IN A GERMAN VILLAGE.*

DIFFERENT people hold different opinions, and English impressions of life among the Germans are by no means exceptions to the universal rule. The late William Howitt wrote delightfully and sympathetically of it, as of everything, either domestic or rural, that touched his fancy; and some of Charles Lever's reminiscences of sojourns in old-fashioned inns among the primitive German villagers, with *al fresco* repasts in gardens under the cherry-trees or trellised vines, are among the pleasantest pictures in his Continental novels. On the other hand, the late Mr. Mayhew devoted a couple of bulky volumes to the abuse of German habits in general, and of all things Saxon in particular; while Mr. Vizetelly, expatiating at even greater length, has been demonstrating that in the capital of the country of the milliards everything that glitters is far from being gold. Mrs. Chetwynd is one of the writers who see things in rose colour; and she even gives a flattering report of Berlin, objecting to nothing but the filthy cabs and the sandy wastes that surround it. For ourselves, we have always regarded the newer Kaiserstadt as among the dullest of great European capitals. Remembering Mr. Vizetelly's carefully collected statistics, we greatly doubt if there are the number of "immensely rich merchants" that Mrs. Chetwynd supposes; while we are very sure that the numerous poor are by no means so well cared for as she imagines. On the whole, however, we assent to her cheerful experiences, and we like the buoyant humour in which she writes.

German life has undoubtedly its drawbacks to a foreigner. We object to the lady of a family figuring too evidently as the *hausfrau*, and we have a prejudice against her appearing in wrapper and slippers should she be indiscreetly surprised by a visitor before midday. We dislike the slovenly way in which the earlier *frühstück* is served, though the principle of the refection is a sound and satisfactory one; we detest the German bed, whether in summer or winter, with its slippery over-coverings; and we hate the system of stove-heating, which we believe to be as unwholesome as it is cheerless. German maid-servants, though the moral character of the class may be above the average, are perhaps the most awkward and least engaging in the world; though we admit that the hotel waiters continue to be fairly good, notwithstanding the enormous numbers exported. German cookery leaves much to desire, even apart from the insular prejudices against uncooked ham and sausages which Mrs. Chetwynd never succeeded

* *Life in a German Village.* By the Hon. Mrs. Henry Weyland Chetwynd, Author of "Neighbours and Friends," &c. London: Blackwood & Sons. 1879.

is surmounting. We know that the early dinner-hour is a wise and salutary practice, since potato salads and sauerkraut swallowed late in the evening must inevitably generate nightmares and dyspepsia. But in spite of these disadvantages, and without excepting Switzerland, in our opinion there is no country in Europe where a summer holiday may be spent more agreeably than in Germany. You have the richest possible variety of landscapes that are neither savage in their sublimity nor monotonously tame. You come, as Lever and Mrs. Chetwynd came, on charming rural inns, where you are treated on the shortest notice as a respected friend and customer. You take your strolls abroad among a simple people who salute you pleasantly as old acquaintances; and you are delighted at every turn by bits of picturesque architecture that escape the eye of the regular tourist. We suppose the Germans may be sinners and self-seeking like the rest of us. We know that in the characters of Rhine porters and *lacquais-de-place* they very speedily are thoroughly demoralized. Yet somehow, when we cross the German frontier, we always feel ourselves among a friendly people, as in scenery that is most impressively *freundlich*.

This was clearly the impression of Mrs. Chetwynd, who went prepared to make the best of things, and has evidently an enviable capacity for doing so. A lady who, being prematurely awakened before five o'clock in the morning by the demonstrations of industrial energy in a sequestered village, can take a three-and-a-half hours' walk before breakfast, and return with no worse feeling than the exhaustion which a good meal can recruit, must be quite equal to sleeping soundly on the floor upon a railway-rug when she was disappointed in the matter of expected accommodation. The village where Mrs. Chetwynd settled at first with her family appears to have been somewhere in the north of Hanover. She had secured what was supposed to be a furnished house; but it soon appeared that the description was delusive in the extreme, at least according to our English notions. Mrs. Chetwynd waxes eloquently pathethic over the deception, emphasizing words in italics after the manner of ladies. There were no mattresses on the beds; the very scanty furniture showed the extreme of mediæval discomfort; while, as for crockery and common kitchen utensils, nothing of the kind had been provided. Having recovered the first shock, Mrs. Chetwynd proved equal to the circumstances. She had an interval of four days before the arrival of the rest of her party, and in that time she furnished the house as she best could from the nearest town. Meanwhile, as we have said, she roughed it through the night upon her personal wraps, having recourse in the day to friendly neighbours for the strictest necessaries of existence:—

> We borrowed a cup from one person, a coffee-pot from another, and we had at any rate coffee; and we ordered our dinner from a wonderful little restaurant not far off, and had dinner—quite enough for two people, and consisting of soup, meat, vegetables, and a pudding—for the sum of tenpence. It was very cheap, if a little greasy.

The cost of a sufficient dinner from the restaurant gives some notion of the scale on which it is still possible to live comfortably enough in some not very remote parts of Germany. But, of course, so far as amusements go, one ought to be self-contained, or very easily entertained by trifles. Mrs. Chetwynd assures us that the days went swiftly by, and that she and her friends enjoyed the life amazingly. But then they abandoned themselves to its uneventful course, and drifted contentedly on the untroubled current. The strongest sensations were the discovery of some new walk, "of a wild strawberry bed, or some fragrant honeysuckle." Their observations beyond those on the surrounding scenery were confined to the habits and customs of their poorer neighbours. They were happy in hitting upon a good cook, who, though hot in temper, and having to be managed diplomatically, made superb pastry and puddings with the most miserably inadequate appliances. But even the tranquillity of that Teutonic Eden was disturbed. The post people knew nothing about foreign postal regulations, and were swaddled besides in official red tape, and this must have come very hard on a literary lady; while the woods, beautiful as they were, swarmed with bloodthirsty midges and mosquitoes, which not only tormented the strangers in their walks, but relentlessly followed them into their sleeping apartments. At last the valuable, though "violent," cook suggested a sovereign specific. The rooms were sprinkled with petroleum, and Mrs. Chetwynd even scented her hat with the oil. Fastidious people, as she not unnaturally remarks, might have found the remedy nearly as disagreeable as the disease.

The party made many expeditions from their village home, and they moved on afterwards to Berlin and Dresden. But among the most interesting contents of Mrs. Chetwynd's chapters are the accounts of her visits to German country houses. They chanced to be staying with a wealthy Hanoverian count on the great occasion of the celebration of his birthday. It was a day rather to be remembered than enjoyed. At a very early hour the English visitors were aroused by the jubiant strains of a powerful brass band. "I cannot remember any cessation; of course the original band must have rested; but music was there all the same, and no change was perceptible." There was a table loaded with birthday gifts, and a cake covered with little candles—a candle for each year of the master's life; but the great and novel feature of the entertainments was a melodramatic representation of his uneventful biographical annals. The Herr Graf was paraded as the prominent figure on a great waggon. First, he appeared as a small boy, that being meant to symbolize his personality in his school-days. Next, he was a youth studying law; and so it went on from age to age. But "the most amusing scene was intended to show the various occasions on which he had lost his heart—a waggon-load of *alte flammen*, consisting of Swedish, Italian, English, Greek, and Spanish figures, the dresses capitally arranged and the figures well posed." And the whole of the domestic play was got up by the servants of his household and the people on his home farm; the only star engaged from the outer world being the boy who undertook to represent him in his school-days.

There is a very lively and graphic account of their stay at Gorisch, in the Saxon Switzerland—the village where they were forced to rise with the sun and the very early-rising natives. The steep crags in the neighbourhood were covered with pine trees, wherever the roots could find a scrap of soil to lay hold of. "But these pines have one beauty the Scotch pines have not. The great buds, usually a bright brown or yellow, which crown the branches in Scotland, are here, as in the Alps, a vivid flame colour and stand out against the rocks splendidly"; while "the blackberries that carpet the ground beneath their boughs are giants, compared to the ordinary Scottish growth." The little inn, too, had its own attractions. In it, as in all the surrounding houses, there were the exaggerated dormer-windows, peculiar to the Saxon Switzerland, "exactly the shape of a human eye, and staring out of the red roof in a manner which endows the houses with a most extraordinary human expression." And those extraordinarily human eyes had characteristic sights to gaze upon. "Never perhaps in so small a space" (as in the courtyard) "were so many animals gathered together. Besides the white ponies, there were brown ones; and there was a brown horse—a tall, ill-made animal, with very straight shoulders and very thin legs, which was called a lady's horse, and which we heard was in great request, later on in the season. There were two donkeys, several fowls, many cows, pigs and sheep, dogs and cats of course, and pigeons without end. Of course, had it been a farm, there would have been nothing extraordinary in the collection; but in a farm there would have been some provision made for their accommodation, while here the whole happy family lived in the smallest conceivable space—donkeys, fowls, and ponies in the same stable; and as they each had their little tempers, the noise at times was anything but musical." We hope we may have done justice to Mrs. Chetwynd's style by slight quotations taken almost at haphazard. She has made a readable little book out of scanty materials, and we can safely recommend it for the use of families of frugal minds who are bent upon quiet holiday-making in Germany.

JAMES'S HAWTHORNE.*

THIS volume, in which Hawthorne is boldly claimed as an "English man of letters," is not the only Life of him that has appeared; for a few years ago the novelist's son-in-law, Mr. Lathrop, wrote *A Study of Hawthorne*, "an ingenious and sympathetic sketch," as Mr. James says, "in which the author has taken great pains to collect the more interesting facts of Hawthorne's life." On that sketch, and on what Hawthorne himself has left of autobiography in his six volumes of note-books, Mr. James bases the narrative part of his little book; of which we may say at the outset that it is only less interesting than the critical account which he gives of Hawthorne's writings. For not even in the case of a writer like Hawthorne can the facts of the life be neglected if we are to understand and enjoy his work. Simple, uneventful, and "deficient in the dramatic quality" as the story is, Hawthorne cannot be appreciated without reference to the woods of Concord, the field-work of Brook Farm, the Boston Custom-House, and the Liverpool Consulate. He was born in 1804, at Salem, Massachusetts, on the "birthday of the Republic," the 4th of July; and he died at Plymouth, in New Hampshire, in 1864, a few months before completing his sixtieth year. His race had been settled in Salem for two centuries, the "first ancestor, invested by family tradition with a dim and dusty grandeur," having been Major William Hathorne, a Puritan settler for conscience' sake, and the next having been Colonel John Hathorne, whose exploits in persecuting witches gave the novelist the idea of one of his greatest stories. Puritans by temperament and seamen by profession were almost all the intervening Hathornes; for Salem, as is known to all readers of the delightful prologue to *The Scarlet Letter*, is a seaport that once had life and activity. Hawthorne's father was Daniel Hathorne (it was the novelist himself that inserted the *w*), "a hardy privateer during the War of Independence," who died on a voyage when the boy was four years old. Mr. James passes lightly over the childhood of his subject, remarking, with more adherence to truth than most biographers can boast of, that "there is a considerable sameness in the behaviour of small boys." Much of his boyhood was spent with an uncle amid the forests of Maine; and it was here, Hawthorne himself said later, "that I first got my cursed habits of solitude." When he was nearly seventeen he entered Bowdoin College at Brunswick, Maine, "a homely, simple, frugal 'country college' of the old-fashioned American stamp," in which were to be found, as Hawthorne's fellow-students, Horatio Bridge, after-

* *English Men of Letters.—Hawthorne.* By Henry James, Junr. London: Macmillan & Co. 1879.

wards a naval officer of distinction, Franklin Pierce, who in 1852 was elected President of the United States, and Henry Wadsworth Longfellow. The chief results of his residence at Bowdoin seem to have been the friendship which he formed with these three, and the production of his earliest novel, *Fanshawe*—a book which he afterwards suppressed so rigorously that not half-a-dozen copies are known to have survived. Mr. James has never seen this novel, but quotes a few paragraphs on the authority of Mr. Lathrop, from which it would seem that Hawthorne did well in obliterating so crude a performance.

After graduating in 1825 Hawthorne went back to live at Salem, without a profession and without any idea of adopting one. It is hard to say that the next twelve years were all a mistake on his part, seeing what work came ultimately from that "period of incubation"; but they were years of solitude, of "gloom and chill," even of unhappiness. He looked to letters for his future, and prepared himself for that future by cultivating his imagination and that reflective observation of which the *American Note-Books* give us so suggestive a record. But he was absolutely alone, intellectually speaking; "he lacked the comfort and inspiration of belonging to a class." The solitary worker, as Mr. James says, is inevitably more or less of an empiric; and this fate Hawthorne did not escape. "Poor Hawthorne, beginning to write subtle short tales at Salem, was empirical enough; he was one of, at most, some dozen Americans who had taken up literature as a profession.' But the *Twice-Told Tales* were the fruit of this retirement at Salem; and, though the early ones among them made no stir, recognition came before long, and brought with it, if not wealth, at all events a subsistence. Nothing like them had been seen in America before, or in Europe either; and it is with no surprise that we read in Hawthorne's note-book the entry, written at Salem in 1836, "In this dismal chamber FAME was won"—though it was in the first instance but a fame which brought him into the clutches of literary speculators like Mr. Peter Parley. In 1839, by one of those wonderful turns of fortune's wheel which are only possible in a country which enjoys the blessing of a rotatory Civil Service, Hawthorne found himself, as a good Democrat, sharing the spoils which were brought to the party by Mr. Van Buren's presidency. He was made weigher and gauger in the Boston Custom-house. The author of the *Twice-Told Tales* superintending the discharge of a coal-ship is as satisfying a picture as Burns measuring barrels or Wordsworth distributing stamps.

Readers of this little memoir will turn with especial curiosity to the chapter which deals with Hawthorne's experiences of Brook Farm, that "little industrial and intellectual association that formed itself at this time (1840) in one of the suburbs of Boston." Mr. James speaks with perfect fairness of this interesting but unsuccessful experiment:—

> The Brook Farm scheme was, as such things go, a reasonable one; it was devised and carried out by shrewd and sober-minded New Englanders, who were careful to place economy first and idealism afterwards, and who were not afflicted with a Gallic passion for completeness of theory. There were no formulas, doctrines, dogmas; there was no interference whatever with private life or individual habits, and not the faintest adumbration of a rearrangement of that difficult business known as the relations of the sexes. The relations of the sexes were neither more nor less than what they usually are in American life, excellent; and in such particulars the scheme was thoroughly conservative and irreproachable. Its main characteristic was that each individual concerned in it should do a part of the work necessary for keeping the whole machine going. He could choose his work and he could live as he liked; it was hoped, but it was by no means demanded, that he would make himself agreeable, like a gentleman invited to a dinner-party. Allowing, however, for everything that was a concession to worldly traditions and to the laxity of man's nature, there must have been in the enterprise a good deal of a certain freshness and purity of spirit, of a certain noble credulity and faith in the perfectibility of man, which it would have been easier to find in Boston in the year 1840 than in London five-and-thirty years later.

The second volume of the *American Note-Books* contains the best record of Hawthorne's doings at Brook Farm, in his letters to the lady whom he was soon to marry and whom he honestly intended to bring to live in the community. Hawthorne on the deck of the collier was an incongruous figure, but not so incongruous as Hawthorne standing, pitchfork in hand, by the "gold-mine," as he sweetly called the manure-heap of the Association. At first he took kindly to his toil:—

> All the morning I have been at work under the clear blue sky, on a hill-side. Sometimes it almost seemed as if I were at work in the sky itself, though the material in which I wrought was the ore from our gold-mine. Nevertheless, there is nothing so unseemly and disagreeable in this sort of toil as you could think. It defiles the hands, indeed, but not the soul. This gold ore is a pure and wholesome substance, else our mother Nature would not devour it so readily, and derive so much nourishment from it, and return such a rich abundance of good grain and roots in requital of it.

This was written on May 4; but by August 12 the tone is changed:—

> Even my Custom House experience was not such a thraldom and weariness; my mind and heart were free. Oh! labour is the curse of the world, and nobody can meddle with it without becoming proportionately brutified! Is it a praiseworthy matter that I have spent five golden months in providing food for cows and horses? It is not so.

He could not long endure either the drudgery or the "sultry heat of society" which were the conditions of life at the farm; and when in 1842 he married, he took his bride, not to the farm, but to the "Old Manse" in the village of Concord, to which we owe the choicest pages of the *Note-books* and the volume of *Mosses*. The four years of his life at the Manse can only be described by the hackneyed word "idyllic," so peaceful were they, so transfused with the golden light of imagination and affection. Emerson was Hawthorne's neighbour all this while, and the relation between the two was a very perfect one. Truly, as Mr. James says, "little Concord had not been ill-treated by the Fates—with a 'great original thinker' at one end of the village, an exquisite teller of tales at the other, and the rows of New England elms between!"

By this time Hawthorne was forty, however, and children were beginning to appear. If he was to do anything for solid fame or for an income, he must begin to work to more purpose than the "two to four hours a day" of story-writing or note-writing he had as yet achieved. In 1846 he accepted the post of Surveyor of the Port of Salem, a post too well paid for him to be able to refuse it; and in these duties he spent the next three years. Mr. James quotes, from the prologue to the wonderful novel which was the product of these three years, a striking passage which would show, in the first place, that Hawthorne liked drudgery as little now as of old at Boston and Brook Farm; and, secondly, that he seemed to regret the inevitable twist which sent him for the subjects of his stories to the airy region of the past and the ideal rather than to the facts of the world around him. "The wiser effort would have been to diffuse thought and imagination through the opaque substance of to-day, and thus make it a bright transparency . . . to seek resolutely the true and indestructible value that lay hidden in the petty and wearisome incidents and ordinary characters with which I was now conversant." It is as though Hawthorne were regretting that he was not a Dickens or a Balzac, on which our comment must be that it is generally unwise in a man to wish to be something quite different from what nature made him. *Il ne faut pas sortir de son caractère.* A realistic study of Salem life might have been an admirable piece of literature, but the world would be loth to exchange it for *The Scarlet Letter*. It was in this last that Hawthorne first did himself full justice, and people in America, and in England too, were quick to recognize the masterpiece. "It was a great success, and he immediately found himself famous"—not possessed of that limited and esoteric "Fame" of which the *Note-Books* had spoken ten years earlier, but of the fame which makes a writer's name the plaything of the educated mob, and his characters the stock subjects of every picture gallery. The success of *The Scarlet Letter* was enough to console Hawthorne for the loss of his post, which had come as a matter of course with the defeat of his party in the Presidential election. He was able to retire to a little house in the village of Lenox "among the mountains of Massachusetts," and to write *The House of the Seven Gables*. In 1852 came *The Blithedale Romance*—a story suggested, but only suggested, by his memories of Brook Farm, the heroine being a kind of glorified and beautified Margaret Fuller, who appears under the name of Zenobia. By this time Hawthorne was accepted as the chief of American prose writers, his position was assured, and the appearance of each new book of his was a literary event. But he had not seen Europe, and he was not rich; so that when, in 1852, his friend General Pierce became President and offered him the well-paid Consulate at Liverpool, he accepted it, and came for seven years to England and Italy. These were the years in which he wrote *Our Old Home* (a collection of articles on England) and *Transformation*. His latest years, after his return home, were clouded by the Civil War; a fact of appalling magnitude to all Americans, but to none so appalling as to the Northern Democratic party, the party to whom the United States under the old *régime* of Southern ascendency was the best of all possible Republics, and one that could never be shaken. No great literary work was likely to be produced during these years; and Hawthorne, ill and dispirited, achieved nothing but two fragments. He died suddenly and without warning, on the 18th of May, 1864.

Our space has exhausted itself without our being able to do more than to run through the main facts of Hawthorne's biography, and we must leave unsaid all that we might have said to illustrate or to controvert Mr. James's criticism of his writings. The truth is that these books of Mr. Morley's series are not easy to review. They are, at least the best of them are, themselves the quintessence of criticism; to abridge their judgments is difficult: to demur to them satisfactorily within short limits is more difficult still. If we might venture to state a few opinions without defending them, we should say that to our mind Mr. James goes too far in claiming for Hawthorne a purely external attitude in relation to moral problems; and that he rates the *American Note-Books*, and perhaps *Transformation*, not highly enough. The former we cannot help regarding as among the most perfect and beautiful revelations of a writer's personality that exist in literature; they are the *Confessions* of an innocent Rousseau, who had nothing to confess except the closeness of his walk with nature. *Transformation* will always be a debated ground among critics, and will be liked or not according as the critic cares or does not care for mystery and gloom in fiction. We admit, however, that the story does not equal the two greatest American novels, the position of which in the highest class of modern writings is never more to be assailed. Hawthorne was indeed a first-rate writer; gifted with the rarest and subtlest imagination, and with a style at once so individual and so sympathetic that every reader is instantly caught and held by the charm of it. Such a man requires the most delicate handling on the part of the critic, and he has received it from Mr. James. Probably no one living could have done so good a book on Hawthorne as he has done. Essentially unlike as the two writers

are, Mr. James is imaginative enough to render Hawthorne's moods for us in a way that commands our assent to his rendering; besides, he knows New England down to its very roots; he moves at will between the American standpoint and the European; and he is the master of a style of exceptional fineness and elasticity. It would be easy to fill a column with instances of his felicities of expression and truth of insight; but perhaps it would be rendering a better service to him and to our readers to send them to look for these in the book itself.

EIGHT MONTHS IN AN OX-WAGGON.*

MR. SANDEMAN falls into the common error of people who publish accounts of their travels. He gives himself the trouble to write a great deal which no one can care to read. Rather, we should say, he does not give himself the trouble to cut it out when he had once written it down. From the dedication of the book, and from the form in which the narrative is cast, we gather that it was first written in the form of letters or a diary. Now a traveller's friends, we at once admit, generally enjoy the most petty details that he may condescend to send them. But when he sets out from home in the quest of health, as Mr. Sandeman did, "looking a miserable invalid, with difficulty able to walk a mile, and utterly unfit for exertion of any kind," then the accounts of his appetite, his meals, his down-sitting and his uprising, are received with an anxiety that passes into perfect enthusiasm as the reports grow better and better. We can easily picture to ourselves the delight with which the news spread through the family group and an extensive circle of acquaintances that the traveller "had done ample justice to the new-laid eggs, splendid ham, and fresh bread and butter provided at Mrs. Murray's Pinetown Hotel." Scarcely had they settled down into calmness from the rapture which such news would raise, when the next mail would bring news that he had "made a capital tea of hashed mutton at Curry's Hotel." Such glorious news as this could not be brought by every steamer. Yet it was something, they must all have felt, to know that at a roadside inn he had some bread-and-butter, and that at a farm a day or two later he procured some fresh milk which was very acceptable. They would be pleased moreover to learn that on one occasion, early in his journey, when he encamped beside a stream, he and his friend had a wash in it before breakfast. But matters such as these, though very properly put into letters and diaries, are best left there. No doubt Mr. Sandeman has very high authority for paying great attention to his meals. "Some people," said Dr. Johnson, "have a foolish way of not minding, or pretending not to mind, what they eat. For my part I mind my belly very studiously, and very carefully; for I look upon it that he who does not mind his belly will hardly mind anything else." However, the great lexicographer did not carry his great principle further than this. He minded that highly respectable and important organ of the body, no doubt, but he did not write about it. He dined, but he kept no diary of his dinners. Now travellers ought to remember that we who have stayed at home have had our meals as well as they, though we did not perhaps bring to them the same keen appetite. If we do not trouble them with an account of what we have eaten in England, let them not insist on telling us what they have eaten in Africa. They have had their meals, and said, no doubt, grace over them, and all that was then left for them to do was to digest their food properly. We have so often had to point out this before, that we are beginning to despair of working any cure. Fresh books of travels are constantly coming out; but in almost all of them there is the same bestowal of all the tediousness that the traveller possesses upon the unhappy reader. It would be a good thing if Messrs. Cook would add to their agency one further branch, and would undertake on the traveller's return to cut down his narrative to decent limits.

Had Mr. Sandeman given us two hundred pages instead of four hundred, we could have read his narrative with not a little interest. He travelled through a wild country in somewhat wild times; and he spent, as the title of the volume shows, eight months in an ox-waggon. He left home to recruit his health, and he arrived at the Cape "a miserable invalid." He took at once to an out-of-door life of rough hardship, and within six months "he was able to walk from sunrise to sunset, ride on shoulder, under a blazing sun, without feeling unduly fatigued at the end of a long day's work, and often with no more strengthening food to work on than mealie-meal pap, or other vegetable diet." He ran considerable risks from wild beasts, as he left his waggon for a fortnight while he went to hunt buffaloes and lions, and he ran perhaps no less risk from the Kaffirs. It was but the year before last that he took his trip, and he passed through a part of the country where Secocoeni's people had begun to plunder. The account he gives of this part of his journey is certainly interesting even to the general reader. To sportsmen, however, it will be most attractive. It is difficult, indeed, to believe that even they can care to know that on Wednesday the 17th (of what month we are not told) Mr. Sandeman with a charge of No. 6 laid low a wild duck, and that the discharge of his gun roused a pair of large blue doves, one of which A. dropped. If, however, they do care for such matters as these—and of the talk of the sportsman it certainly cannot be said, as of the law, *de minimis non curat*—then they may possibly be glad to learn that at least on one occasion the travellers saw a very large herd of spring and blesse-bôk together, but were not able to get within range. Within range of a great many herds of these animals they were able to get. We are ourselves now and then more pleased when we find that Mr. Sandeman misses his aim than when he succeeds. When he is surrounded in his camp by lions, when he is charged by a buffalo and has the narrowest escape of his life, when he comes across a boa-constrictor eighteen feet long, then our sympathies are with the traveller; but there are times when we could have wished that he had had a less steady aim. He chased a herd of giraffes on his horse, and, coming near, fired at one. "To my great delight the tall head fell forward, then down almost between the forelegs, and the giraffe toppled over on its side." Some forty pages further on he says:—"The eyes of the giraffe are the most beautiful and appealing of any animal I ever saw. . . . It is the most defenceless animal imaginable, and has nothing to show fight with, even if so inclined. . . . Unless the hunter has opportunities of utilizing the skin, it always appeared to me rather wanton slaughter destroying giraffes, as neither difficulty nor danger attended their chase." Mr. Sandeman here shows good feeling. We trust that, should he ever again come across these defenceless animals with their beautiful and appealing eyes, he will not any more seek after "great delight," but will try to act on Wordsworth's lines:—

> Never to blend our pleasure or our pride
> With sorrow of the meanest thing that feels.

On this hunting expedition game was not seen for two or three days, and the travellers were getting short of food. Many of the Kaffirs had joined the party as porters, mainly in the hope of the abundant supply of meat that they would obtain. They were becoming very melancholy and discontented, while even the Englishmen were growing ravenous for fresh meat. When at last some buffaloes were killed, the white men were quickly shown one side of savage life, and that by no means a pleasant one:—

> It was such a scene as I am powerless to describe. Each boy sat at the fire in front of his own particular stick or ramrod, on which were the little knobs of meat; but beside each was a pile of long strips about an inch thick, and some of them a yard in length. While his knobs were slowly roasting the boy would take one of these long strips, containing at least half a pound of meat, and, holding one end in the flame, would let it get toasted for a few seconds; then he would place that end in his mouth, and begin to chew it, placing the still uncooked end in the flame, and at the same time watching that the knobs on his stick did not get burnt. For three hours or more not a boy moved from the fire, except to cut up a fresh supply of meat or to have a drink of water. All this time they hardly spoke a word, so intent were they on gorging themselves; but as the night advanced they broke into a low, monotonous sort of humming chant, during which, one after the other, they recounted some adventure of the day, or expressed their delight at so much good food, the others all the while keeping up an accompanying chorus of the humming chant. Occasionally they would raise their voices to a yell, and then sink them so low as to be almost inaudible. Woodward and myself turned into our blankets, and were soon lulled asleep by the monotonous but not unpleasant singing. All through the night the boys alternately ate or sang, and several times when I awoke I saw them still hard at work chewing down the yards of meat.

The next morning they presented most of the appearances of drunken men. Their eyes were rolling, they could hardly walk straight, and they spoke and looked as if they were insensible to what was going on around them. They were utterly unfit for work, and the hunters had to encamp there for another day and night, till the men had recovered from their debauch. Mr. Sandeman employed Kaffirs of more than one tribe. Among them all he gives by far the best character to the Zulus. The ordinary Kaffir, he says, is utterly untrustworthy and unreliable. Why, by the way, when he had said in good English that a man is untrustworthy, does he say the same thing over again in bad English, by adding that he is unreliable? Perhaps he fears that some of his sporting readers may have got so used to bad English that good English will puzzle them. But to return to the Zulus. They are, he writes, almost invariably honest, truthful, and reliable servants. "A Zulu will always stand by his master if an occasion comes for blows and hard knocks, neither will he ever run away and leave him in the hour of sickness and helplessness." Mr. Sandeman wrote this a few months before our war with them broke out.

He travelled from Durban through Natal into the Transvaal. The account he gives of these territories agrees with all that we have read elsewhere. Our wonder is once more raised how it has happened that, while in North America, in New Zealand, even in Australia, there is an abundance of fertile land only awaiting the hand of the tiller, our countrymen should have settled in the midst of savage nations in such barren wastes. The Boers, no doubt, pressed northwards in the search of independence when we seized on the Dutch colonies, much as the Esquimaux and Laps in ages past retired to the barren shores of the Northern Seas. But why we followed them, it is not easy to see. In Natal and the Transvaal and many of the other States of this part of Africa the plagues of life are as abundant as its blessings are few. There are no roads—or, at all events, the roads are far worse than those which were so bad before they were made by Marshal Wade. There are every year great droughts. Insects swarm. The north-west wind is "a scorching blast, charged with minute particles of rock-sand, which inflame the eyes and irritate the skin." There are poisonous snakes, wild beasts, and almost

* *Eight Months in an Ox-Waggon: Reminiscences of Boer Life.* By E. F. Sandeman. With a Map. London: Griffith & Farran. 1880.

wilder men. There is scarcely a single article that can be bought at a moderate price. Mr. Sandeman was more than once among the gold-diggers. No coal-heaver or navvy, he says, has a tithe of the hardships and fatigues which he undergoes. "All day long toiling hard in a broiling sun, and up to his middle in water, and at night no comforts of any kind when he returns to his hut." Fuel is so dear that he can only afford just enough to cook his bit of meat and boil his kettle. In the nights of winter he suffers, high up on the hills, from the piercing winds, while the water in his hut is turned into ice. Animals of all kinds are subject to diseases peculiar to the country. Horses, sheep, and horned cattle are swept away by thousands. In many parts even the pleasures of the chase can no longer be enjoyed, so ruthlessly has the game been destroyed. Where herds of deer used to wander, now not a single head can be seen. There are, no doubt, large tracts of fertile land; but they are often widely separated from each other and from the seaports by deserts, over which the wretched oxen drag their heavy loads, urged on by the most shameful cruelty. The way is often marked by the bones of poor beasts which, when they had once fallen, were too weak to be roused up, even by the tortures which Mr. Sandeman saw practised on them by their drivers. One great good is done both by such books as this and also by the newspaper correspondents who have accompanied our armies. Those who go to these districts of South Africa go with their eyes open. As regards them, even the most artful of emigration agents will find it hard to practise their well-known delusive arts.

We must not forget to add that the value of Mr. Sandeman's volume is greatly increased by an excellent map of the Transvaal and the surrounding territories.

JOURNAL OF THE ARCHÆOLOGICAL INSTITUTE.*

MUCH of the interest of the present volume converges in Northamptonshire, the capital of which county was the place where the Archæological Institute gathered in 1878. The members who there attended were unfortunately deprived of an expected address from Mr. Freeman, who however sent a letter, herein printed, which pointed out some of the leading facts in the history of Northampton. One class of events to which attention was drawn must have suggested that more important congresses than the meeting of the Institute could be likely to prove had assembled in that ancient town, which in the time of the Norman kings was as favourite a centre for national synods as had been the mysteriously situated Cloveshoe in the days of Offa, King of the Mercians. At Northampton Harold met the Northumbrian insurgents, and swore to them the peace which Edward had granted them, that legalized the expulsion of Tostig and the election of the son of Alfgar. At Rockingham (A.D. 1094) Anselm, bolder than the conclave of bishops around him, who were afraid of the King, defied Rufus to the face in his attempt to measure the secular arm against the spiritual. The great Council of Stephen was held at Northampton in 1138, which was also a seat of the Councils of Henry I. and Henry II., the conspicuous figure in the famous convention of 1164 being Thomas Becket. In 1189 the national synod of Richard II. met in Northampton Castle, as did the great Council of John in 1211 and the legatine synods of Henry III. Keeping rather to the spirit than to the letter of the facts represented, Shakspeare's play of *King John* opens at Northampton. That town was visited not less than twenty-three times by the royal hero of the piece, who stayed the while either at the castle of the same place or at Rockingham Castle, the forest about the latter fortress being one of John's favourite hunting-grounds. In the Chancellor's Roll of the third year of that King's reign are some curious entries. For instance, there is a charge of five marks for "repairing the King's houses in the Castle of Northampton"; and "to sergeants who brought the heads of six outlaws, six shillings." Also, "for bringing the hunting-gear of the King from Northampton to Westminster, half a mark," and "To the chaplain at Geddington 50s., his salary for the past year." This chaplain was the King's confessor, and, considering how much shriving his royal master needed, his stipend of a shilling a week was not high.

Among the contributors to the past year's Proceedings we are glad to meet with the name of Mr. M. H. Bloxam. It is more than fifty years since Mr. Bloxam began to do honourable service for archæology by the publication of his *Principles of Gothic Ecclesiastical Architecture* (May 1829); and his paper here published on the "Mediæval Sepulchral Antiquities of Northamptonshire" shows that neither his zeal nor his strength for the study of ecclesiastical antiquities is abated. Wiser than Old Mortality, who only revived the inscriptions on monuments which were themselves liable after all, like unique manuscripts, to be finally destroyed or lost, Mr. Bloxam has perpetuated by descriptive particulars a selection of the most interesting of upwards of two hundred examples of effigies, either sculptured in stone or wood, or incised in brass, in the county of Northampton. Effigies in England, remarks Mr. Stothard, are rarely met with before the thirteenth century. One somewhat earlier is here noticed, that of Benedict, Abbot of Peterborough, who died A.D. 1193. It represents the Abbot, in eucharistic vestments, within a horizontal trefoil-headed canopy, which is apparently supported on each side by a reed-like column, with an Early English capital. Mr. Bloxam remarks that there are few sepulchral effigies of Benedictines in the habit of their order, and that a thirteenth-century image of a Benedictine in his monastic costume, larger than the life, in a niche of the gateway of the Bishop's Palace south-west of the Cathedral, is intended for St. Benedict himself; which seems more likely than that it is St. Luke or St. Philip, as the cast of the effigy in the Sydenham Crystal Palace states it to be. It is singular that there is no sepulchral effigy of a bishop in the county of Northampton. In Peterborough Cathedral there was, according to Gunton, a stately tomb in memory of Bishop Dove (A.D. 1630) "in his episcopal robes on a large bed under a fair table of black marble, with a library of books about him"; but in the Puritan frenzy against prelacy this statue was hewn to pieces by the Parliamentary soldiery. Of figures in armour there is "a large and wonderful variety," from one at Castle Ashby Church of Sir David de Esseby, who died before 1268, to that of Sir John Germaine, Bart, who died in 1718; the former being of course in chain mail, which fell wholly into disuse in the reign of Edward III., and the latter in a species of plate armour which might have belonged to his sire, for armour in his day had ceased to be worn. Mr. Bloxam despairs of describing the rapid change in female attire which, beginning with Scholastica de Gayton, living in 1284, in Gayton Church, ends with Lady Mary Mordaunt, in Lowick Church, who died in 1705, with a few of later date which "I do not comment upon." Scholastica's, the earliest, is the most beautiful and chaste in the arrangement of drapery.

A careful disquisition on "Parish Churches in the Year 1548," by Mr. J. F. Micklethwaite, contains a discussion on the ambiguous injunction of 1547 which retains "two lights upon the high altar before the Sacrament." Mr. Micklethwaite too hastily suspects that the original document has been wrongly printed, "for by no possible contortion could two lights placed upon the altar be before the Sacrament, either lying in the midst of the altar or reserved by suspense, as was then the custom." There is evidence, however, that it had long been customary to place two lights upon the altar through the administration of Mass or Holy Communion; and, in spite of the vagueness of the injunction, these must have been the lights that were ordered to be maintained. Mr. Micklethwaite particularizes the other lights which were in use up to 1548 and partially continued during that year, such as the baptismal candle, the hearse light, the Paschal candle, the torches borne in processions, &c. On the 2nd of February, 1547-8, according to Stow's "Chronicle," "the bearing of candles in the church was left off throughout the whole citie of London." But the custom lingered in some of the provinces long after its legislative abrogation. Under 1583 we find in the wardens' accounts of the Norman church of St. James, Bristol, "Paid to the waytes a Candlemas day and night at our church 2s. 6d., and a pound of tallow candles that night 3d.," which does not, however, argue a very brilliant illumination. Perhaps one of the latest instances of the exaction of the tribute of a funeral torch occurs in A.D. 1640, when there is a petition from the inhabitants of Dundry, on a spur of the Mendips, complaining that Mr. Fabian, the Vicar of Chew, three miles distant, refuses to allow burials at Dundry unless the inhabitants pay him a wax candle every year on St. Andrew's day. He had several times caused dead bodies which had been brought to Dundry for burial to be violently carried away and buried at Chew; while his conduct, on the whole, seems hardly to have entitled him to the honour of a candle—certainly not a lighted one.

Mr. G. T. Clark has raised the investigation of mediæval fortification to the dignity of a science, and a study of his papers on this subject is a liberal education in castle architecture. As far back as A.D. 1836 he published in a short-lived provincial periodical (*The West of England Journal*) an "Essay on Caerphilly Castle," which included a restored plan of that magnificent Welsh fortress, the chief façade of which is "one of the finest and most complete specimens of a feudal line of defence extant in this or any other country." Indeed, for extent Caerphilly in its present condition is like the ruins of a fortified town. We doubt almost as much whether Mr. Clark has ever equalled his essay on that castle as whether any English writer has equalled Mr. Clark in a thorough knowledge of the typical arrangements of a feudal fortress. The present volume, however, contains several papers from his hand, two of these being on the "Land of Morgan and the Earls of Gloucester," and a third on Rockingham Castle, which should be read in connexion with the Rev. C. H. Hartshorne's account of the same fortress in the first volume of the *Archæological Institute Journal*. Mr. Clark's genealogy of the Earls of Gloucester is vitiated, like every pedigree of the same family from Dugdale downwards, by some confusion between Richard the son of Gilbert, the English founder of the Clares, and Richard FitzGilbert, the grandson of the founder. Mr. Clark writes that the earliest of these Richards was slain at Llantony by Yorworth, brother of Howel of Caerleon, about 1091, and that he was buried at St. Neots. He likewise says that the second Richard, grandson of the first (who, by the way, was father of Walter de Clare, the founder of Tintern Abbey), also met his death "from the natives of South Wales—it is said, by Morgan ap Owen—in the disturbances that broke out after the death of Henry I.," and that "the assassination is supposed to have occurred in 1139." "He was buried," adds Mr. Clarke, "at St. Neot's." That the fate of the earlier Richard is confounded with that of the later is plain from the *Annales Cambriæ*, where, under A.D. 1136, it is said "Richard filius Gilberti a Morgano filio Owyni occisus est," the day of the assassination having been,

* *Journal of the Royal Archæological Institute of Great Britain and Ireland.* Vol. xxxv.

according to the continuator of Florence of Worcester, April 15, who adds that he was honourably interred, not at St. Neot's, as above, but in the Chapter-room of St. Peter's, Gloucester, where Leland (*Itin.* iv. p. 80) says that he saw his tomb. Yorworth and Morgan ap Owen, of the *Annales*, were brothers, who, according to Powell's *Cambria*, were living in 1157, or sixty-six years after the assumed murder of the earlier FitzGilbert, who we have no reason to believe died other than a natural death. The error would have been hardly worth correction had it not persistently led to a mistaken identity of persons.

A paper on the Provincials of the Friars Preachers, by the Rev. C. F. R. Palmer, is a scholarly contribution to English monastic history, which is the more welcome since the mendicant fraternities have hitherto received but scanty attention; even Dugdale having excluded them from his *Monasticon*, though his later editors have meagrely treated upon their several Houses. The great evil of poverty, says a Roman satirist, is that it makes men ridiculous. The Dominicans, at least in their earlier form, though professors of poverty, were not ridiculous, for they dignified indigence by preaching the Scriptural declaration that God had chosen the poor of this world, rich in faith, and heirs of the promised kingdom. Accordingly, their priories, instead of being planted, like the stately abbeys of the monks, beside pellucid fishing streams, where they might fatten like the dull weed on Lethe's wharf, were within hearing of the hum of some city whose crowded population of neglected poor attracted their missionary zeal. Gilbert de Fresnoy was at the head of the thirteen friars who in 1221 first came into England. On reaching Canterbury with his brethren he preached before the Archbishop, Stephen Langton, who was so satisfied with the discourse that he took the new religious order into favour. To the dignity of Archbishop and Primate of all England, one of the Provincials, Father Robert de Kilwardby, was himself at the instance of Henry III. appointed by Gregory X. As the King died the month following Kilwardby's election, in October 1272, one of the first acts of the new Archbishop was to proclaim Edward I. in the presence of the prelates and nobles, who met in the New Temple, London. Under the title of St. Rufina Kilwardby became a Cardinal of the Holy Roman Church. At the time of his receiving the distinction he was seventy years old; but, in spite of his age, he made his journey on foot to Rome, staff in hand, for he never forsook the habit of his order nor abated anything of his religious austerity. The works of this eminent scholar and theologian, including twenty-eight treatises on Logic and Philosophy, are enumerated in Quetif and Echard's *Scriptores Ordinis Prædicatorum*. Mr. Palmer gives biographical particulars, gathered from laborious research, of as many as forty Provincials. One of the last and best known names is that of John Hilsey, who, as a Dominican prior, was as hot against the doctrines preached by Latimer as he was afterwards, when Bishop of Rochester, strong for the King's supremacy. Before his arrival at the latter dignity he had been constituted Provincial of the Friars Preachers in order to bring that body into subjection. His work was the easier that he met with less opposition than hypocrisy. From Exeter, June 21, 1534, he wrote to Cromwell, "I have not found any religious persons in my visitations that hath utterly denied and refused the oath to be obedient, true, and agreeable unto the King's high pleasure and will. Yet I have found some that hath sworn with an evil will, and slenderly hath taken an oath to be obedient; of whom I shall more openly declare and show unto you at my next coming unto your honourable mastership, by God's grace." Hilsey's religious, or rather ecclesiastical, views appear to have matured with the growth of the Reformation. Of his exhibition of the blood of Hailes and the Rood of Grace at St. Paul's Cross we are weary of reading, and Mr. Palmer seems designedly not to have repeated the account. In 1539 he published a service book in which was introduced, says Mr. Proctor, as much doctrinal innovation as Cromwell could then venture upon. It has the abrogation of the Holy days, and the form of bidding of beads, in which, by the King's injunction, all mention of the Vicar of Rome was omitted, and the royal supremacy in the Church asserted instead. This, together with all preceding primers, was superseded in 1545 by King Henry's Primer.

Mr. J. H. Parker, C.B.'s articles on the "Cathedral of Pisa," with "Notes upon Pisan Churches," will prove a useful corrective not only to Murray's Handbook, but also to some architectural misstatements of Mr. Ruskin, whose splendid faculty of language does not always convey exact information; at least so Mr. Parker believes, while claiming him for his "excellent friend." Mr. Ruskin, we are assured, has "misled thousands of persons by following the ideas of the time of Gally Knight, and not being conscious of the *Revolution* that Professor Willis has produced."

Besides the articles we have mentioned, there are several on Anglo-Roman roads, by Messrs. W. T. Watkins, J. F. Marsh, and the Rev. R. S. Baker, which are written with a mild enthusiasm that may perhaps communicate an interest in their subject to an attentive student; and, though the study may not make the reader, like Monkbarns, resolve to travel henceforth only by the great consular ways, it may help him to form some views of his own in relation to certain stations, for he would undoubtedly find it difficult to establish a harmony between the divergent theories here propounded.

CHURCH'S STORIES FROM THE GREEK TRAGEDIANS.*

IT is a happy accident on which we must congratulate Mr. Church, that the drama of old Athens, based on the ancient myths of Thebes and Delphi and the legends of the Atridæ, the Erectheidæ, and the Labdacidæ, furnishes as available matter for Christmas gift-books as the famous classical epics which in years past he has dressed up in attractive guise for the same festive season and purpose. The juvenile reader is thus won and impressed unawares, and catches, as it were, imperceptibly the threads of stories which are the framework of all classical dramatic poetry, and which will hereafter live in his mind, investing the once abominated Greek Play—formerly a by-word for all that is crabbed and incomprehensible—with a charm wholly unknown to former generations of schoolboys. Prose versions and verse translations abound of Æschylus, Sophocles, and Euripides; but the tale of those which the kindliest critic could pronounce successful might be told on the fingers of one hand. By a thorough, loving, and habitual study of his admirable models Mr. Church has acquired a nicety of tact in judging what to reject, what to compress, and what to dwell upon; and yet we are disposed to think that he must have found the task of discrimination more difficult, if better worth grappling with, in dealing with Attic drama than when he represented storywise the epics of Homer or Virgil. Be this as it may, his method of manipulating his materials is just such as will recommend itself best to those most imbued with the manner of Greek tragedy. It would seem that one noticeable feature in it—namely, the rare and partial utilization of the choral odes, which, when they contain aught signally noteworthy, are, save in the case of the *Agamemnon*, taken out of their proper place, as detached utterances of sentiment—is a special result of a study of the relation of chorus to dialogue in the plays of the three great dramatists. It may be that the comparatively few cases where our author has availed himself of the chorus—originally an important figure in the plot, especially with Æschylus—and the close connexion (as in the *Agamemnon*) of the action of the drama with the choral ode in the immediate context, have seemed to Mr. Church to claim exception to his general rule of limiting his material to the dialogues and monostichs, the level passages rather than the high-flown lyric interludes. At any rate, in submitting the transcendent tragedy of the death of Agamemnon to a *raconteur's* handling he has freely availed himself of its memorable lyrics, bringing out effectively the portent of the eagles and the pregnant hare, the touching sacrifice of Iphigenia, the desolate aspect of Menelaus's hearth when Paris had rifled it, and the handful of ashes in urn of brass which "Ares the changer, but not of money," sends back to Greece for her host of heroes. Another instance may be drawn from the same story, where, in p. 148 (*Agam.* vv. 668–700) one of the old men (the chorus, be it remembered, of this drama) is made the mouthpiece of a sentiment and a similitude generally admired by students of Greek choral poetry:—"Rightly," he declares, "they named her Helen, for like *hell* hath she devoured men and ships, aye, and this great city of Troy. I have heard tell how a man reared a lion's cub in his house. Very pleasant was he at the first, for the children played with him, and he made sport for the old; but when he grew he showed the temper of his race, and filled the house with blood. Even so came Helen, smiling and fair to Troy, and now behold the end!" Such echoes of lyric songs are happily suited to the story-teller's purpose; nor can we too much admire Mr. Church's tact in making so much of the salient points of the dialogue—as, for example, the watchman's misgivings darkly hinted as to the ill-ordering of the house; Clytemnestra's description of the succession of beacon fires which "Athos sent southward across the sea on a path of gold like the sunshine"; the reproduction of the hardened woman's fair, glozing utterances to her returning lord in all their two-edged ambiguity, and his contrasted bluntness, when he likens her length of speech to his term of absence. The story waxes still more stirring when Cassandra answers not to the false biddings of Clytemnestra, but, looking back on the tragedies of the House of Atreus, scents by anticipation the blood of the slaughter-house. Equally forcible, even without the outlines of Flaxman, is the presentation of the conclusion—the bold, bad woman boasting over the corpses that she is not the dead man's wife, but the avenging Ate, and, with a feminine yearning that "the shedding of blood should have an end," soothing her paramour's ire at the symptoms of a rebellious spirit by the counsel, "Heed not what these babblers say."

So much for the story wrought out of the masterpiece of Æschylus. There are two kindred character-dramas of Sophocles and Euripides which our author has admitted to his list of subjects, possibly with a view to point the contrasts of woman's nature—the *Trachiniæ*, or Death of Hercules, which turns on the love and jealousy of Deianira, and the consuming love, turned to hate, of the slighted Medea, whom many have regarded as the most tragic of Euripides's heroines. If, as has been recently suggested, the *Trachiniæ* could be proved to be a later play of Sophocles, and of a date subsequent to the *Medea* of Euripides, it might seem as though the second of Attic tragedians had purposely sought to model a typical outraged wife, more womanly and less barbarously witch-like than his rival. The sequence in which Mr. Church gives the "Vengeance of Medea" and the

* *Stories from the Greek Tragedians.* By the Rev. Alfred J. Church, M.A., Author of "Stories from Homer," &c. With twenty-four Illustrations from Designs by Flaxman and others. London, Seeley, Jackson, & Halliday. 1880.

"Death of Hercules" seems to show that he wished to indicate this antithesis of subjects, for the two follow, in order of supposed date, the beautiful tale of Alcestis. Passing over the building and equipment of the Argo, the quest of the Fleece, the taming of the bulls and the sowing of the dragon's teeth, one of the most noteworthy materials for this story is Medea's exchange of a magic ointment, rendering the possessor invulnerable, for Jason's plighted troth; a second is the removal from her husband's path of the usurper Pelias, by a lying parable (so to speak) of possible rejuvenescence. It prepares the reader for after tragedies, nor is one surprised to learn soon of Jason's estranged feeling, and his overtures to a more human bride, Glaucé, the daughter of Creon, King of Corinth. It augurs ill for the new alliance when Medea pledges the chorus to silence, and appeals to their pity in the touching plea, "For a man, if he be troubled at home, goeth abroad and holdeth converse with his friends and equals of age, and is comforted. But with a woman it is not so; for she hath only the life that is at home." As a woman, she can image to herself the joys of a happy home; as a sorceress, she is impelled to work ill to all who have destroyed that home. She gains with difficulty one day's delay of her banishment, in which ostensibly to provide for her children, but really to plot death to the King and his daughter. A vehement altercation with Jason sums up in a few sentences the bitter taunts which liken Medea's false lord to base coin, and exhibits the craven meanness of Jason's pliant character, where he resorts to the argument that, being an exile in the city of Corinth, he could not do better than marry the daughter of the King. Having secured her means of retreat, she plots revenge by a mock propitiation of her rival, and, after she has learnt that the poisoned robe and chaplet have wrought their worst upon Glaucé and Creon, slays her children almost before their father's eyes, and escapes his vengeance in a winged dragon-car of the Sun, her sire, wherein she takes flight for the Court of Ægeus at Athens.

The story of Deianira is more full of the human element. Achelous the river god wooes her roughly and unsuccessfully, some details of his wooing and his strife with Hercules being transferred from the third chorus to the prologue. Anon, when Hercules has won her, he is in danger of losing her by the lawless hand of the Centaur Nessus, who is shot in the act of carrying her off as he ferries her over the river Evenus. Hence the tears of the drama; hence the vengeance of the "dead hand" in the legacy of the Centaur's blood, to be smeared upon a garment of her spouse, as a rekindler of lost love. The gist of the story is the arousing of Deianira's pity, and then jealousy, at the sight of Iole, her husband's captive light-o'-love, and a troop of like-fated maidens; and, when she has ascertained the truth of the story, her unwitting resort to Nessus's bequest. She despatches by Lichas, the herald, a robe anointed with the Centaur's blood, not to be exposed to the sun till Hercules shall don it for a sacrifice. But soon her heart misgives the loving woman, and she fears that, in place of recalling her husband's errant love, she may but work his death, for a morsel of sheep's wool dipped in the blood wherewith the robe was anointed wastes and consumes on the instant of exposure to the sunshine. Ere long comes Hyllus, her eldest-born, to tell her of his father's fiery pains and sweats, his frantic wrath against the bearer of his death-robe, and his execrations against the sender. The almost utter silence of Deianira when she learns her fatal error is highly tragic; and when the dying hero returns to Trachis, to find his queen no more, our storyteller felicitously ends his story by making him ask, "Who of the men of Trachis is so cunning in leechcraft" as to suggest this death-spell, whereon he learns that "Nessus the centaur gave her the poison long since, that she might thus win back thy love," and recognizes the legacy of the "Dead Hand." The brief allusion to the hero's funeral pile on Mount Œta seems more fitly to interweave with the pathetic and touching story of his comrade Philoctetes, with which, in fact, one of our most poetic neo-classicists connects it in his metrical drama of *Philoctetes*, "after the antique," published some fifteen years ago. The central figure of the story is surely Deianira, the Imogen of Sophocles, a guileless, devoted woman.

A briefer glance is all that can be given to others of these stories from the dramatists. And first a word touching the *Love of Alcestis*, a vague yet curious foreshadowing of the doctrine of "vicarious atonement," such as often comes across the reader of the Greek plays. Few parallels are to be found, however, to the contention of Apollo with Death (pp. 2 3), which Mr. Church, after his manner when dealing with what is unique or exceptional, has reproduced almost word for word; or to the later wresting of his prey from Hades, which takes place, it is true, behind the scenes, but is realized when the hero comes back with the veiled lady to repair his unintentional breach of the rules of hospitality in having unwittingly feasted at the crisis of his host's sorrow. In this story much is made of Alcestis's visit to her bridal chamber from the handmaid's description, and of her visions of Charon's skiff and the Messenger of the dead, cleverly interwoven from the choral lines. The character of Hercules, plainspoken and blunt, seems at first unfeeling, but only through a misunderstanding. Admetus said of the dead in his house "that she was a stranger by blood, but near in friendship, and that she had dwelt in his house, having been left an orphan of her father. Nevertheless Hercules would have departed and found entertainment elsewhere, for he would not be troublesome to his host, but the King suffered him not." The first discovery of the truth is when the hero has, later on, cross-questioned the guest-attendant. In the altercations of Pheres with Admetus, even on Mr. Church's showing, there is some weight in the grandfather's reluctance to abridge his little span of life, and we are disposed to accept Professor Mahaffy's estimate of the King's character as "weak and selfish, but hospitable, as men generally are." Among the other nine stories we should reckon those of *Antigone*, *Electra*, the *Iphigenia in Aulis* and *Among the Taurians*, and the *Persians*, as the most attractive. Antigone's devotion to the unwritten but sure commands of Heaven in preference to Creon's decrees and proclamations as to Polynices's body is shown by the course of the story to be in accordance with the sentiment of the common folk, of the Prince Hæmon, Antigone's lover, and of the old and blind soothsayer Tiresias, so often a weighty arbitrator in Greek tragedy. In the story of *Electra; or, the Return of Orestes*, the lines of Sophocles are faithfully and happily followed, the imaginary chariot-race being described with vivid circumstantiality, and the deaths of Clytemnestra and Ægisthus furnishing one stage of the retribution for the death of Agamemnon. In *Iphigenia among the Taurians*, the ἀναγνωρίσις of Orestes and Iphigenia by means of a tablet which she proposes to send home to her nearest of kin to apprise him that she is yet alive, is wrought by Pylades handing the tablet to Orestes in her presence; and in the story of the *Persians* Mr. Church wisely rids the reader of the κομμοὶ by ending his tale where the ghost of Darius vanishes, without awaiting the crestfallen Xerxes.

We should be glad to think that Mr. Church had many more fields of classic fable susceptible of his special mode of treatment. At any rate there still remain a few dramas to which his method might perhaps be successfully applied.

THE PARSON O' DUMFORD.*

THE *Parson o' Dumford* is to our mind a more artistic and dramatic story than any of the former novels by the author which we happen to have read. Mr. Manville Fenn has always been a painstaking novelist, and his conscientious work affords an agreeable contrast to the slovenly productions which swamp the libraries. The *Parson o' Dumford* is no exception. The plot is solidly and ingeniously put together; the scenes have been effectively conceived in relation to the climax; and the various incidents which sustain the excitement are harmoniously arranged to help forward the action. But we admire something even rarer than skilled and careful workmanship in the book. There is a keen perception of the workings of the feelings and passions; there is pathos which touches us the more for the rugged natures which are wrought upon by unaccustomed emotions; and there is a truth in the play of character which reflects the originality and freshness of studies from the life. In one respect the story is pleasantly exceptional, inasmuch as not a soul bearing a title of any kind is introduced, even incidentally, from the first page to the last. The man to whose enterprise the town of Dumford owed its existence, or at least its development, is not even knighted; and the Parson himself is the only person who has indisputable pretensions to rank as a gentleman. It is a tale of hard times among the working classes; of passions excited by strikes and privations and quarrels embittered by an employer's tyranny. We confess to knowing nothing ourselves of the rude local dialect; but it gives one the idea of being faithfully rendered, and though it is employed freely, it is sufficiently intelligible not to interfere with a clear understanding of the story.

The Rev. Murray Selwood is a somewhat eccentric and quixotic young clergyman, who is admirably adapted for the venture he undertakes. He has been looking out for a parish that shall task his superabundant energies, and in Dumford his wishes are gratified to the uttermost. A finer field for disheartening enterprise no muscular divine need desire, and his predecessor has left the soil practically untilled. The former occupant got on fairly well with his flock by simply leaving them to their own devices. He was popularly known by a half-contemptuous nickname, and he conciliated prejudice by dropping in at the public-house to smoke a pipe over a "gill of ale" with the jovial landlord. The religious ideas of the factory hands of Dumford are limited to the assertion of their spiritual independence by parading their detestation of priestly interference. Doing a hard day's work for a good day's wage, they despise their pastor as a drone who draws his stipend for doing nothing. Before Mr. Selwood has even set foot in the town, he has an opportunity of beginning as he means to go on. Walking across the hills, carrying his night-baggage in a little hand-bag, he makes the acquaintance of a specimen of his new parishioners. Tom Podmore appears to be of the stamp of the native who welcomes any stranger in a decent coat by "heaving harf a brick at him." He returns a brutal answer, or rather no answer at all, to a civil question. In the brief interview in which the newcomer asserts his ascendency Mr. Fenn introduces the Parson very artistically. Selwood's bearing and behaviour speak for themselves, and we feel persuaded that he will have his way in the end with the semi-barbarous industrial roughs of Dumford. The manner of his arrival, like his offhand address, shows that he does not stand on ceremony. The imperturbable good humour he opposes to Podmore's coarse incivility shows an easy conviction of superiority, to which the other insensibly submits. The new parson is evidently neither a pre-

* *The Parson o' Dumford.* By George Manville Fenn. London: Chapman & Hall. 1879.

cisian nor an ascetic, which are decided points in his favour. He lights a pipe with an air of intense enjoyment, and presses his pouch of excellent tobacco upon Podmore. He laces a capful of water from the brook with spirits from a pocket flask, and insists upon the young man sharing the draught. He mentions incidentally that he is fond of cricket, and rather a good hand at roundhand bowling. In the course of a quarter of an hour he makes a staunch friend of Tom Podmore, and the friendship subsequently serves him well. Tom, who is really a very honest fellow, though externally as rough a diamond as any of his comrades, explains half apologetically that he has been "popped" (put out of temper); and as the pair walk on together towards the town, they chance to come across the cause of the "popping." Of course the cause is a comely young woman, who has been playing fast and loose with Tom's affections. But adventures and introductions crowd upon Selwood before he reaches his parsonage. With the comely Daisy Banks is the charming Miss Eve Pelly, whom the Parson has the opportunity of rescuing from a quaking bog, and who acknowledges the little service with a frank sweetness that fascinates him. A little further on, by the way, while sauntering through the town, the bricks are heaved at him, in the shape of a couple of pieces of slag or refuse, which are the more natural missiles of the people in an iron foundry.

The Parson, as is shown by results, is the very man for Dumford, and all the more so because he is anything rather than the conventional clergyman. He makes no concealment of tastes that might be regarded elsewhere as barely orthodox. There are fishing-rods and guns in the corners of the room where he receives his parochial visitors, and there is an even stronger defiance of popular prejudices in the foils and boxing-gloves that are displayed on his walls. That he is a good man with the gloves, or without them, he has very speedily an opportunity of proving; and in a row when he rescues the great man of the place from a mob of his justly infuriated workpeople, he gains the affections of one of the most stalwart of the ringleaders by a straightforward blow delivered from the shoulder. Mr. Selwood happens to be rich too, and it turns out that he has accepted this thorny cure from sheer love of arduous work. The way in which he extends his growing influence by action and example rather than sermons, his force of character, his ready tact, and his genial temper are all well brought out. The best of the people in their time of trouble turn to him naturally for help and counsel. It is quite intelligible that the men should respect their cheery, stalwart, and straightforward divine, who is as able in case of necessity to knock them down as to pick them up; who is discreetly generous to the deserving and the undeserving alike; and who quietly refuses to take offence, however offensively they behave to him. But he is just as successful in winning the women, though he does not go out of his way to flatter them. It is not only that he becomes at once the confidant and counsellor of Mrs. Glaire, though he is detested by her son, who is the master of the works. But he makes even a more absolute conquest of his own vinegar-tempered housekeeper, who, though she can never lay aside her waspish manner, becomes bound to the Parson soul and body. All the Dumford folks of the lower orders are excellently drawn, without exception, and some of them are described very humorously. There is Sam Slee, the good-for-nothing husband of the Parson's housekeeper, with his grandiloquently illiterate speeches as a stump orator, and the struggles between his self-consequence and his appetite when he is filling his stomach at the Parson's expense. There is Jacky Budd, the Parson's gardener and the parish clerk, with his specious pretences for shirking work and his unquenchable thirst for the ale to which he professes himself profoundly indifferent. Of a very different stamp, and, next to the Parson himself, the finest character in the story, is Joe Banks, the veteran foreman at the works. Joe had been the old comrade and lifelong friend of the father of Richard Glaire, who had made himself and his fortune. Joe's staunch devotion to the widow and son of his old comrade has a great deal of rude chivalry in it. Dick Glaire is one of the basest curs we have ever met in the pages of fiction; yet Joe makes it an article of faith to believe in "the lad," and insists upon shutting his eyes to his faults. The interest of the story turns in great measure on Glaire's licentious pursuit of the daughter of his kind old foreman. Daisy Banks is pure enough, though over head and ears in love with the deluder, and Mrs. Glaire is anxious to stop the mischief and save the girl and her scapegrace son. There is an excellent scene when she sends for Joe Banks to enlist his assistance. Banks, after one violent outbreak of temper when she has put the matter to him from the common-sense point of view, calms down, and becomes perfectly good-tempered. He knows Mr. Richard far too well to believe he can mean any harm to the lass; and not even the uncharitable ideas of the mother can shake his conviction. He trusts Daisy as he trusts Richard. "Seen them together?" of course he has, and many times. As for Dick's kissing the girl, nothing can be more natural. He has gone courting himself in his time, and so has Mrs. Glaire. And he remains equally imperturbable when the old lady insists that the only honourable solution of Dick's ambiguous attentions is quite inadmissible. Why should not Mr. Richard marry the lass? Daisy is as sweet a girl as ever stepped, and good enough for any man. Mr. Glaire is a working-man's son, as she is a working-man's daughter. Nor, in spite of the respect he has for Mrs. Glaire, can she drive him for a moment from that position. Comedy, as might be expected, turns to tragedy before the affair is brought to a conclusion. Daisy Banks has disappeared, and though it comes out that Mrs. Glaire is the person implicated, of course suspicion has fallen on her son. Banks is maddened with grief and rage, and in his determination to be revenged upon the author of his daughter's ruin, has leagued himself with some of the worst characters in the place. It is he who has undertaken to blow up the works, which have hitherto been dear to him next to his daughter. At the moment when he is bending over the powder train to fire it he is interrupted. Glaire has been hiding in the works. Daisy, though her love has turned to aversion, has come to him with warning of the mischief meant him, and the maddened father is brought face to face with his rascally employer and his missing daughter.

For what passes in the circumstances we must refer our readers to the book; we should be sorry to spoil their interest in a highly exciting complication. Nor will we do more than hint at the upshot of Mr. Selwood's unspoken attachment to Eve Pelly, which has taxed the Parson's extraordinary powers of self-control to the uttermost. Miss Pelly is engaged to her cousin Glaire, and the Parson knows it; and knows besides, far better than that confiding young woman, how utterly undeserving is Glaire of the object of the Parson's adoration. That he tries hard to save Glaire and to keep him straight in spite of himself is only in keeping with the heroic self-denial of the man and his inborn sense of honour and duty. And when we see Eve go actually to the altar with her cousin, while Selwood has most reluctantly consented to unite them, we doubt whether his self-sacrifice was not criminal, while we feel that he is submitting himself to refinements of torture. If a clever novel is to have a happy ending, that ceremony must be interrupted somehow or other, and all the chances are against an interruption so unprecedented. Our suspense is continued to the closing pages; for Mr. Fenn, being far from a commonplace author, is just as likely to do violence to his readers' sympathies as to let them lay down his volumes with a sigh of relief.

Erratum.—*In our article of last week on* "The Old Year and the New," *the name* "*Mrs. E. M. Ward*" *was by a printer's error substituted for* "*Mr. E. M. Ward.*"

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

Now ready, VOLUME XLVIII., bound in cloth, price 16s. Cloth Cases for Binding all the Volumes, price 2s. each. Also, Reading Cases, price 2s. 6d. each. May be had at the Office, or through any Bookseller.

THE SATURDAY REVIEW.

Price 6d.

ADVERTISEMENTS.

THE GROSVENOR GALLERY.

WINTER EXHIBITION.

THE GROSVENOR GALLERY—OPEN DAILY FROM TEN TILL SIX.

Galleries Lighted at Dusk.

Admission, 1s. Season Tickets, 5s.

STATISTICAL SOCIETY.—The NEXT ORDINARY MEETING of the present Session will be held on Tuesday, the 20th Instant, at the Society's Rooms, King's College Entrance, Strand, W.C., London, when a paper will be read on "The Strikes of the Past Ten Years," by G. PHILLIPS BEVAN, Esq. The Chair will be taken at 7.45 P.M.

THE ANNUAL CONFERENCE of the TEACHERS' ASSOCIATION will be held in the Theatre of the Society of Arts, John Street, Adelphi, on Thursday and Friday, the 15th and 16th of January. The Chair will be taken at 12 o'clock by Canon BARRY. Canon BARRY's Address will be followed by a Discussion on Dr. Lyon Playfair's Bill and other proposed measures for the Organization and Registration of Teachers. Papers by Dr. ROTH, Dr. GLADSTONE, and others, will be read and discussed.

THE TAY BRIDGE DISASTER.—At a PUBLIC MEETING held in the Town Hall, Dundee, on Wednesday, December 31, 1879, Provost BROWNLEE in the Chair, it was moved by the Rev. Dr. WATSON, and seconded by Mr. YEAMAN, M.P.:

"That this Meeting of the Inhabitants of Dundee desires to express its deepest sympathy with the friends of all those who were suddenly swept into eternity by the stupendous disaster at the Tay Bridge, and that a Committee be appointed to receive subscriptions, and to administer the fund that may be subscribed according to the necessities of the case."

Subscriptions will be received by the Treasurer, Mr. ALEX. SCOTT, Clydesdale Bank, Dundee, and by

WM. BROWNLEE, *Provost of Dundee.*

UNIVERSITY COLLEGE, BRISTOL.—CHEMICAL PROFESSORSHIP.—The Council invite applications for the Chair of CHEMISTRY. Salary, £300, with a share of the Students' Fees. Applications, with testimonials, to be sent not later than February 9, 1880. Further information may be obtained from the Principal on application to EDWARD STOCK, M.R.C.S., Secretary.

STROUD LADIES' COLLEGE, Beeches Green, Stroud, Gloucestershire.—*Principals*, The Misses HOWARD. FIRST TERM will begin January 22. Two Vacancies.

THE Misses A. & R. LEECH'S SCHOOL (late Belgrave Cottage) for LITTLE BOYS will RE-OPEN Wednesday, January 21, at 65 Kensington Gardens Square, Hyde Park, W.

MORNING SCHOOL for YOUNG LADIES, at 14 Radnor Place, Hyde Park, W. The NEXT TERM will begin on Thursday, January 15. For Terms, apply to Miss HARRIETT COOPER, Successor to Miss MARY LEECH.

BRIGHTON.—FIRST-CLASS EDUCATION for the DAUGHTERS of GENTLEMEN.—Every educational advantage, combined with careful training and home comforts. Only a limited number of Pupils received. House facing the sea. Terms, 100 guineas. Apply, by letter, to LAMBDA, Treacher's Library, Brighton.

RADLEY COLLEGE.—SCHOLARSHIPS.—£50, £50, £30, £20. Examination begins January 21, 1880.—Apply to Rev. the WARDEN, Radley College, Abingdon.

BRIGHTON COLLEGE.

The NEXT TERM will commence on Tuesday, January 20.

F. W. MADDEN, M.R.A.S., *Secretary.*

DOVER COLLEGE.—Board, £46 6s. a year. Tuition, from Thirteen to Eighteen Guineas a year.

The NEXT TERM begins on January 21.

Apply to the Rev. W. BELL, M.A., the Head Master; or W. KNOCKER, Esq., the Honorary Secretary.

KELLY COLLEGE, TAVISTOCK.

Head-Master.

R. W. TAYLOR, M.A., late Fellow of St. John's College, Cambridge, and Assistant-Master at Marlborough and Rugby; Editor of "Stories from Ovid" and "Xenophon's Anabasis."

Assistant-Masters.

J. M. BATTEN, M.A., Scholar of St. John's College, Cambridge, First Class in Classical Tripos, 1875.

Rev. F. DYSON, B.A., Fellow of St. John's College, Third in First Class Classical Tripos, 1877.

The NEXT TERM begins January 23, 1880.

THE ISLE of WIGHT PROPRIETARY COLLEGE, Limited.—The FIRST TERM will commence on Thursday, January 29, 1880. *Head-Master*—The Rev. F. B. PENTREATH, D.D., Oxon. For particulars apply to HEAD-MASTER at the College, or to the SECRETARY, Cambrian House Offices, Ryde, Isle of Wight.

LANCASTER SCHOOL.—NEXT TERM begins January 21, 1880. Board and Tuition 65 Guineas per annum.—Address, Rev. W. E. PRYKE, M.A., Head Master.

FULLANDS SCHOOL, TAUNTON.—The NEXT TERM begins on January 22, 1880. *Principal*—WILLIAM REED, Esq., F.C.P. London. *Vice-Principal*—Rev. WM. REED, M.A., St. John's College, Cambridge, Mathematical Tripos, 1868.

BRUCE CASTLE SCHOOL, TOTTENHAM.—Unexcelled in healthiness of situation and beauty of grounds. Buildings and internal arrangements most complete. During 1879 past or present Pupils have gained at Oxford a First in Final Mathematical Schools and a Classical Exhibition at Balliol College; also a high place for R.M.C. Woolwich. A Preparatory department for Young Boys. For details of the School, &c. apply to Rev. W. ALMACK, M.A.

MR. C. H. LAKE'S SCHOOL, "Withernden," CATERHAM VALLEY, RE-OPENS January 20. Boys receive individual attention.

ARMY, COOPER'S HILL, INDIAN CIVIL SERVICE, &c. Rev. Dr. WRIGLEY, M.A. Cambridge, formerly Professor of Mathematics at R. I. M. C. Addiscombe, prepares PUPILS, by whom the highest places have frequently been obtained. Sons of Clergymen, and of Indian Officers and Civilians received at exceptional rates.—Address, 67 High Street, Clapham, S.W.

THE PHILBERDS PREPARATORY SCHOOL (near MAIDENHEAD).—BOYS are specially prepared for the Scholarship and Entrance Examinations at all the Public Schools; also for the Naval Cadetship Examination. After the Christmas Vacation the Management of the School will be in the hands of Mr. E. M. PRICE, Mr. F. W. S. PRICE, and the Rev. W. H. GWILLIM, all of St. John's College, Cambridge. In the meantime, for full information, apply to the present Head-Master, the Rev. E. H. PRICE. In the New House a JUNIOR PREPARATORY SCHOOL has been established for quite LITTLE BOYS.

H. HART, M.A., late Fellow of Trinity College, Cambridge, and Mathematical Instructor at the Royal Military Academy, Woolwich, wishes to prepare a few BOYS for the Public Schools.—Address, Avalon House, Eltham, Kent.

FOLKESTONE.—MR. W. J. JEAFFRESON, M.A. Oxon, assisted by a Cambridge M.A. and competent Teachers, prepares PUPILS for the Universities, Sandhurst, Woolwich, the Civil Service, and all Competitive Examinations. A few Vacancies.

THE GRANGE, BUSHEY, Herts.—Miss WILKIE receives a limited number (TWENTY-FIVE) YOUNG LADIES for BOARD and EDUCATION. High-Class Professors from London attend for English, French, German, Latin, Mathematics, Drawing, Music, Singing, and Dancing. A large proportion of the Pupils have annually passed the Oxford and Cambridge Examination.

CARSHALTON HOUSE SCHOOL, Surrey.—BOYS carefully prepared for Civil and Military Examinations.

SCHOOL for BOYS, age Five to Fourteen. Recommended by the Rev. Dr. Jex-Blake, Head-Master of Rugby; the Rev. Canon Duckworth, D.D., 77 Hamilton Terrace, N.W.; the Rev. Dr. Abbott, Head-Master of the City of London School. For terms apply to Rugby House, 77 Avenue Road, Regent's Park, N.W. Term begins January 19, 1880.

ARMY EXAMINATIONS.—Professor PRITCHARD (late R.M. Academy, Woolwich), and Rev. A. PRITCHARD (M.A. Oxon) have as yet passed 18 Pupils out of 24 sent up since January last. NEXT TERM commences January 6, 1880.—Wargrave, near Henley, Oxon.

BOURNEMOUTH.—CHELTENHAM HOUSE (facing the Sea).—J. WILLIAM WILLIAMSON, M.A., Oxford, receives a limited number of BACKWARD and DELICATE BOYS, to Prepare for the Public Schools or for general Education.—Full particulars and prospectus on application.

WOOLWICH, ARMY.—MORGAN JENKINS, M.A. (Wrangler), assisted by an able staff of Graduates in First-class Honours, prepares PUPILS for the above. All sent up at the last two Examinations of Lieutenants of Militia, viz. three in April, and two in October, passed; also three last July for Sandhurst, and eight out of eleven at different times for Woolwich, one being Second in July 1877.—50 Cornwall Road, Westbourne Park, W.

HIGH-CLASS EDUCATION, strictly Select.—The Rev. A. C. TODD, late of the Punjab, India, prepares PUPILS for the Legal, Medical, Civil Service, and other Examinations, at the Manse, Tattenhall, Cheshire.

ARMY EXAMINATIONS.—Mr. BELL, Limpsfield, Redhill, is now able to undertake the Tuition of One or Two PUPILS for the above Examinations. Next Term begins January 20. For further particulars, address as above.

A LADY wishes to recommend the SCHOOL NEAR LONDON where her Daughters' education was finished. Only DAUGHTERS of GENTLEMEN of position received. Sixteen Pupils. Large detached house. Good garden. French and German Resident Governesses. She cannot speak too highly of the care and kindness of the Principal, or of the educational advantages. Really an educational home. Special care bestowed on delicate girls.—References to Mrs. HALDANE, 1 Grosvenor Crescent, Edinburgh.

MONSR. VALÈRE FARIBAULT, Professor of French at the C. Public School and at the University College, Kensington, would be glad to obtain an ENGAGEMENT in a large SCHOOL (Young Ladies or Gentlemen). He will also open, in January, public French Classes for Young Ladies and Gentlemen, and receive, in the Evening, Pupils having to prepare for the Public Services.—For particulars, apply, by letter, to M. V. FARIBAULT, 33 Warwick Road, Kensington, S.W.

A YOUNG LADY, in her Seventeenth Year, is desirous to obtain Employment as BOOKKEEPER or CLERK in a respectable Establishment. The highest references can be given. Apply to E. S., 73 Lavender Grove, Dalston, E.

JANUARY ELECTION, 1880.—FIFTH APPLICATION.

ORPHAN WORKING SCHOOL, Haverstock Hill, N.—An Earnest Appeal is made to the GOVERNORS and SUBSCRIBERS for VOTES and Interest on behalf of GEORGE STEEL HOLMAN, the youngest of three Orphans, aged Six, Ten, and Twelve. Both Parents are dead. The Case is strongly Recommended by Lady BROMLEY, 30 Loughborough Road, Brixton; G. A. SPOTTISWOODE, Esq., New Street Square; J. P. BACON, Esq., 69 Fleet Street, E.C.; Rev. G. K. FLINDT, Rectory, Denmark Hill. Proxies will be thankfully received by Mr. J. T. RUSSELL, 25 Wellington Road, Cold Harbour Lane.

TRUSTEES are directed to SELL the ADVOWSON of the RECTORY of CATSFIELD, near Hawkhurst, in the County of Sussex. Good Rectory House and 34 acres of Glebe. Net income, exclusive of House and Glebe, about £320 per annum.—For further particulars apply to Messrs. BELL & STEWARD, 49 Lincoln's Inn Fields, London, W.C.

TRUSTEES are directed to SELL the ADVOWSON of the VICARAGE of DALLINGTON, near Hawkhurst, in the County of Sussex. There is a suitable Parsonage House, in good repair. Net income, about £250 per annum. Church recently restored. Further particulars may be had of Messrs. BELL & STEWARD, 49 Lincoln's Inn Fields, London, W.C.

TRUSTEES are directed to SELL the ADVOWSON of the RECTORY of LLANELIEU, near Hay, in the County of Brecknock. Income, about £100 per annum.—Apply to Messrs. BELL & STEWARD, 49 Lincoln's Inn Fields, London, W.C.

TRUSTEES are directed to SELL the ADVOWSON of the RECTORY of LLANSAINTFREAD, near Brecon, in the County of Brecknock, in a most beautiful locality. Good Rectory House. Net income, about £270 per annum.—Further particulars of Messrs. BELL & STEWARD, 49 Lincoln's Inn Fields, London, W.C.

TRUSTEES are directed to SELL the ADVOWSON of the RECTORY of LLANVILLO, with the CURACY of LANDEVAILOG TIER GRAIG, in the County of Brecknock, situate in a most beautiful part of the country. Tithe commutation, £322 per annum. Good Rectory House.—Further particulars may be had of Messrs. BELL & STEWARD, 49 Lincoln's Inn Fields, London, W.C.

OVERLAND ROUTE and SUEZ CANAL.—Under Contract for the conveyance of the Mails to the Mediterranean, India, China, Japan, and Australia. The Peninsular and Oriental Steam Navigation Company despatch their Steamers from Southampton, *via* the Suez Canal, every Thursday, from Venice every Friday, and from Brindisi, with the Overland Mails, every Monday.

Offices, 122 Leadenhall Street, E.C., and 25 Cockspur Street, S.W.

BRIGHTON.—BEDFORD HOTEL.—Facing Sea and Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Service in the Hotel.

BENJN. BULL, *Manager.*

FURNISH YOUR HOUSE or APARTMENTS THROUGHOUT on MOEDER'S HIRE SYSTEM. The original, best, and most liberal. Cash Prices; no Extra Charge for time given. Large, useful Stock to select from. Illustrated priced Catalogue, with Terms, post free.—248, 249, and 250 Tottenham Court Road, and 19, 20, and 21 Morwell Street, W.C. Established 1862.

PEARS' TRANSPARENT SOAP.

A speciality for sensitive Skin.

ESTABLISHED NEARLY ONE HUNDRED YEARS.

Prevents Redness, Roughness, and Chapping. Its regular use ensures a Clear Complexion and a Healthy Skin.

SOLD EVERYWHERE.

GOLD MEDAL, PARIS.

"THE fresh and splendid distinction of a Gold Medal, now given in 1878."—Paris Correspondent of the *Daily Telegraph*.

FRY'S COCOA EXTRACT.

Guaranteed pure Cocoa only, deprived of the superfluous oil. Sold in Packets and Tins.

WILLS'

"WESTWARD HO!"

WILLS' "WESTWARD HO!" NEW SMOKING MIXTURE.

"When all things were made, none was made better than Tobacco; to be a lone man's Companion, a bachelor's Friend, a hungry man's Food, a sad man's Cordial, a wakeful man's Sleep, and a chilly man's Fire. There's no Herb like it under the canopy of heaven." —*Kingsley's "Westward Ho!"* In 1 oz., 2 oz. & 4 oz. packets, lined with tinfoil.

WILLS, W. D. & H. O.

UNION BANK of AUSTRALIA.

Established 1837.

Paid-up Capital £1,437,500

Reserve Fund 800,000

LETTERS of CREDIT, and BILLS on DEMAND or at Thirty Days' Sight, are granted on the Bank's Branches throughout Australia and New Zealand.

BILLS on the COLONIES are negotiated and sent for collection.

DEPOSITS are received for fixed periods, on terms which may be ascertained on application.

SIR WILLIAM HARCOURT AT OXFORD.

THE Liberals of the city of Oxford are fortunate in the member whom they have for some years returned, and in the candidate with whom he is to be associated at the next election. Mr. CHITTY, indeed, contributed little to the gaiety of the late dinner, and when the parts were distributed between himself and his colleague, he may perhaps have felt like an actor who is told off to do the heavy business of FALKLAND, while a livelier comedian amuses the audience as Sir LUCIUS O'TRIGGER or Sir ANTHONY ABSOLUTE. Mr. GLADSTONE was lately angry with the CHANCELLOR of the EXCHEQUER because he had made a speech about finance at the Guildhall dinner; but even a speech on the Budget of the year is more exciting than a learned disquisition on the land laws. Nevertheless Mr. CHITTY is one of the most popular, as well as one of the most eminent, members of the Bar; and if he is elected, he will be a valuable member of the House of Commons. If he was less immediately fortunate in his subject than Sir W. HARCOURT, he was relieved from the necessity of making statements and expressing opinions which would perhaps have conflicted with his habits of professional calmness and accuracy. His colleague understands better the liberties which may be taken with an assembly of partisans; yet it was scarcely considerate to rely so far on the ignorance of Oxford Liberals as to assure them that the Turks had been turned bag and baggage out of Servia, Bulgaria, Herzegovina, Bosnia, and Montenegro. Among a thousand guests there must have been half a dozen who knew that long before the late war there had been no Turks in Servia, and that there never were any Turks in Montenegro. Out of Bulgaria, indeed, a large Mussulman population has been driven with the utmost cruelty and injustice. In Bosnia and Herzegovina the Turkish inhabitants live in peace under the protection of the Austrian Government. In the same spirit Sir W. HARCOURT boasted that General ROBERTS had been driven out of Cabul in the middle of December, while he failed to make the painful admission that he had fought his way back into the city by Christmas Day. A practised political advocate well knows that it is his business to stimulate to the utmost the prejudices of his party, and for the time to be absolutely indifferent to the fortunes of his country. It is highly probable that the unceasing invective which has been directed against the foreign policy of the Government may have produced its intended effect; but perhaps the orators of the Opposition are too hasty in their belief that all the community is on their side.

The Liberal party at Oxford seems to be not altogether happy in its mode of expressing dislike to the Government. Among the inscriptions with which the room was decorated was the remarkable proposition that "a scientific frontier means national humiliation," and the motto *Imperium et Libertas*, which was probably interpreted in its literal sense, was turned upside down. The scenery was worthy of the eminent performer who exults with undisguised satisfaction in the universal failure which he imputes to the Government, and therefore to the country. Sir W. HARCOURT may perhaps prove to be right in his anticipation of victory at the general election, but some of the evidence on which he relies seems to be inconclusive. "Wherever I go, I hear but one voice, 'Let us "'have done with this Government.'" It may be conjectured that the unanimity which prevails is confined to the party which wishes to have done with the Government. A still more surprising appeal was made to the testimony of an impartial witness. "A statesman who has reached a ripe and honoured age, who "has proclaimed his retreat from the active career "of official life, has been impelled to come forward with "inexhaustible energy to bear his testimony against the "policy of the Government. You know what that testimony has been. It has derived a tenfold force from the "disinterested attitude which Mr. GLADSTONE has defined "for himself in political action, and it has been a sentence "of absolute and complete condemnation." The quotation of Mr. GLADSTONE'S dispassionate judgment on the character and conduct of Lord BEACONSFIELD was so daring an experiment on the credulity of faction that it may be suspected to have been introduced for a special object. At a time when Mr. GLADSTONE busies himself with such matters as the discouragement of vaccination, and the payment of the Chairman of the London School Board, it is evident that he has reconsidered his determination of retiring from public affairs. He has neither granted nor refused the demand of a clamorous section of the party that he should resume his former position at its head. It may be conjectured, from the emphasis which is repeatedly laid on Mr. GLADSTONE'S retirement from official life, that Sir W. HARCOURT is not anxious for his return. If Mr. GLADSTONE would but be content with the whimsical function of giving unbiassed evidence against the Tories, there is no doubt that his party would be relieved from the fear of grave embarrassment.

It is not worth while to examine in detail Sir W. HARCOURT'S comments on foreign affairs. He had the candour not to affect the judicial quality of considering more than one side of the question. For a party meeting almost any assertion is good enough, as, for instance, "The idea that "Austria can be constituted the military gaoler of the Slav "nationalities is a conception altogether unworthy of "practical statesmanship, and altogether repugnant to "Liberal principles." Sir W. HARCOURT knew that Austria contains a large Slav population; but he also knew that his hearers would not correct any defect in his argument. It was the Turkish, and not the Slav, population which resisted the Austrian occupation of Bosnia; and, unless "the Slav nationalities" mean Russia, the Austrians are not likely to oppose their aspirations. If Sir W. HARCOURT thinks that Bosnia ought to have been made an independent Christian State, he might remember that a large minority of the population, including the whole of the upper classes, is Mussulman in faith, although it may be of Slavonic descent. The possession of Bosnia by Austria undoubtedly tends to promote the result which has always been thought desirable by English statesmen. Since the defeat of Turkey it has become expedient that a more powerful guardian should defend Constantinople against Russia. Of course some of Sir W. HARCOURT'S objections to the policy of the Government are well founded, and they were all forcibly expressed; but the same criticism applies to his Oxford speech as to nearly all his political addresses. It is incredible that he should be justified in contending that the Government has never blundered into a right course of action nor ever enjoyed a gleam of good fortune. So skilful an advocate ought to

recognize the rhetorical expediency of giving colour, or, in other words, of assuming that there is something to answer.

Another able and perhaps still more zealous Liberal delivered on the same day an equally vehement speech to the same effect. Mr. TREVELYAN, with a complacency worthy of Sir WILLIAM HARCOURT, laments that, "under "the guidance of Lord BEACONSFIELD, Britain has fallen "from her high estate among nations." Among the crimes which have led to the decadence of England, the difficulties in the Transvaal would probably have been enumerated if Mr. TREVELYAN had not, for the purposes of his argument, attributed the supposed misfortunes of the Government to the retirement of Lord DERBY and Lord CARNARVON. Mr. TREVELYAN's comments on domestic affairs were more remarkable than his declamation on foreign policy. He believes that, if the Ministers had confined themselves to administrative business and ordinary legislation, they would have been stronger in the constituencies now than in 1874. "For years after the "great electoral catastrophe of that spring there was no "sign whatever that the Liberal party were recovering "their lost position. The nation persistently refused to take "any interest in the questions which they presented "for its contemplation. It heard unmoved their speeches "about the Regimental Exchange Bill, the Endowed "Schools Bill, even the Empress of India Bill, and they "might have talked till doomsday about extending the "county franchise without practical effect on the House "of Commons or the country." In two of these measures Mr. TREVELYAN has a right of property, and it is but fair to admit the candour of his confession that the country cares absolutely nothing on the merits of the question for the extension of the county franchise. It is hard on those who are anxious to stop short of extreme democracy that its advocates should appeal successfully from the nation sober to the nation drunk with invective on entirely different subjects. The Constitution is to be changed because an English army is in Cabul. In Parliament Mr. TREVELYAN has urged the extension of household suffrage on the ground that it was popular as well as just.

RUSSIA AND EUROPE.

THE warlike designs in Europe which have lately been attributed to Russia are improbable to a degree at which they almost become incredible. Political observers are frequently required to weigh, as accurately as circumstances may allow, internal evidence founded on the interests or disposition of nations and Governments against positive proof; and it sometimes happens that unforeseen caprice deranges the most reasonable calculation. The French declaration of war against Prussia in 1870 could not have been foreseen, except on the assumption that folly and fanaticism would at the moment be supreme. There is no reason to believe that Russia will follow so outrageous a precedent. Some other explanation must be found for the alleged accumulation of troops and warlike stores in the Western provinces of the Empire, and it is not improbable that the statements of German newspapers may have been greatly exaggerated. The Power which, but for the infatuation and corruption of the hostile Government, would have been utterly defeated in Turkey, will assuredly not undertake a wanton conflict with the most formidable of existing antagonists. A Russian general could scarcely hope to win a skirmish or a combat against the armies which would be encountered beyond the frontier. It is certain that at the end of the war the aggressor would not retain possession of a German or Austrian village; and probably Russia might emerge from the struggle with the loss of the whole or part of Poland. The German EMPEROR publicly stated only a few days ago his confidence in the preservation of peace; and, although allowance must be made for his devoted attachment to the Imperial family of Russia, there is no reason to doubt his authoritative assertion. The explanation which the Russian Government has given in answer to inquiries may not impossibly be true. According to this version the result of the Turkish war has rendered unnecessary the maintenance of a large force in the Crimea, in Bessarabia, and on the Armenian frontier; and economic and administrative reasons are alleged for the transfer of a part of the frontier garrisons to the Polish provinces. That a great military Power should take the simple course of dispensing with armaments which are no longer wanted would be a violation of Continental theory and practice. It is true that the armies formerly quartered on the borders of Turkey had no intelligible destination except to effect the invasion and conquest which were afterwards accomplished.

Germans who feel or profess alarm as to Russian designs are compelled to justify their fears by imagining the negotiation of an offensive alliance between Russia and France. It is possible that such a combination may be formed at some future time, and Prince BISMARCK has in his peculiar fashion already intimated to the new French Cabinet his intention of taking vigorous measures against the danger when it arises. But for the present no arrangement of the kind is to be apprehended; and Russia will assuredly not provoke a single-handed contest with two great military Empires. It is highly probable that there is some foundation for the rumours of Russian intrigues against Austria in the Balkan provinces. The Prince of BULGARIA has, probably at the instigation of Russia, dissolved the Assembly, and he is said to meditate some change in the Constitution. The Servians also threaten to give trouble, and the obstinate quarrel between the Albanians and Montenegrins will probably furnish occasion for conflicts of Russian and Austrian influence; but in those regions the struggle will take the form rather of diplomacy than of war. It will not be safe to repeat against Austria the experiment of a subsidized war, such as that which was organized in Servia in 1876. The Austrians could easily crush any disturbance in the Balkan provinces, unless it was openly aided by Russia; and a war between the two Great Powers would at once bring Germany into the field. A Government which has neither a plausible reason nor an intelligible motive for war is, on the whole, likely to keep the peace. The internal condition of Russia, if it is as perilous as it seems to foreigners, furnishes a reason, not against a turbulent policy, but against an enterprise which would strain all the resources of the nation, and which might probably end in utter defeat. It may have been reasonable to hope that revolutionary anarchists would be conciliated by an unprovoked attack on Turkey which gratified both ambitious and fanatical passions. A trial of strength with two great European Powers would offer no similar advantage.

Arguments against the probability of war with Germany and Austria may not apply to a possible quarrel forced upon England; but the expedition which is now in preparation in Turkestan is a guarantee for peace on the Continent of Europe. Reparation of the military failure of last year, and reassertion of the supremacy of the Russian arms, will be popularly approved, perhaps even by the revolutionary faction. It may be convenient to find distant employment for disaffected regiments and for officers who have incurred suspicion. It will be thought expedient to divert attention from periodical attacks on high functionaries, and from violent measures of repression; and ruinous defeat is not to be apprehended in Central Asia, unless indeed General KAUFMANN's force should find itself in collision with the Indian army. There can be little doubt of the success of some or all of the columns which are to converge on Merv. The Duke of ARGYLL himself, in spite of his natural predilection for the one jest of his life, would perhaps now admit that Merv will not only be occupied by the Russians, but used as a base from which Herat may be threatened. The Russian newspapers, which almost always foreshadow the future policy of the Government, already assert the necessity of guarding against an understanding on the subject of Herat between England and Persia. It may be considered certain that the Russians hope to acquire direct or indirect control of the fortress and of the rich district which it commands; and, on the other hand, it is admitted by all but the uncompromising partisans of peace, that the most important outpost of India cannot be tamely surrendered to a rival. The reports of General KAUFMANN's designs, though they may probably be founded on fact, are obviously exaggerated. It is impossible to suppose that an able and experienced commander would attempt to lead 150,000 or 120,000 men through deserts where a fifth part of the number would be a match for any adversary who is likely to oppose the march. The force which was checked last summer before the Turcoman stronghold at Dengel Tepe would have overcome all resistance but for deficiency of transport. The beasts of

burden and the camp followers attending an army of 100,000 men would starve before they could reach the oasis of Merv.

The rumours of the intended concentration of an enormous army in the neighbourhood of Afghanistan are probably spread for the purpose of alarming the English Government, and perhaps of influencing the general election. The Russians believe, perhaps erroneously, but not without plausible grounds for the opinion, that a Liberal Government would at once abandon the Afghan enterprise, which has not yet been completed. It may be thought that a demonstration of force and of hostile designs will, in the event of a change of Ministry, accelerate the process of retreat. It is impossible to foresee whether, under household suffrage and the Ballot, expectations which would have been falsified at any earlier period of English history may or may not be confirmed by experience. To be frightened by the threats of General KAUFMANN or of the Russian newspapers would be not only disgraceful, but foolish. The Russians may cause annoyance to the Indian Government, but they are not yet prepared for a serious trial of strength. The emissaries, if Mr. GLADSTONE will excuse the phrase, who have lately escaped from Tashkend and Samarcand may probably provoke a serious insurrection in some of the Afghan provinces. The Turcomans who are not English allies or dependents will almost certainly fail in an attempt to defeat the Russian occupation of Merv; but Herat will not be a prize of this year's campaign; nor, indeed, is it likely that a collision with England will be deliberately provoked. Any advantage which may result from bluster and from inflated reports of military preparations will be justly regarded as clear gain. If the Nihilists are at the same time amused by warlike demonstrations, another desirable object will have been attained. For England the best security against a quarrel with Russia will be found in resolute indifference to menace.

M. GAMBETTA AND THE REPUBLICANS.

THE event of the week in France has been one that was certain to happen, though the circumstances under which it has happened have given it an exceptional interest. There could be no doubt of M. GAMBETTA's re-election to the chair of the Chamber of Deputies, but there was room for doubt by how large a majority he would be re-elected. If the Right had been ill-advised enough to start a candidate of their own, the Republicans would in all probability have once more shown a fairly united front. But the Right were not thus ill-advised, and it was consequently open to the Republicans to air their divisions without doing themselves any serious harm. Having this opportunity, they took care not to let it slip. M. GAMBETTA was re-elected President of the Chamber, but it was by less than half the total number of the deputies. Out of 533 possible votes, he secured only 259. This was an ample number for the purpose—indeed, as there was no opposition, any fraction of that number would have been sufficient. But it was not an ample number considered as an evidence of M. GAMBETTA's continued popularity among his fellow-Republicans. Of course, as always happens when facts are inconvenient, an explanation is offered which completely accounts for them. The Republican deputies, it seems, have a bad habit of being unpunctual. Advanced as they are in general politics, they cannot come up to time in the matter of voting. Like most theories invented for a purpose, this explanation has itself to be accounted for. Why has this habit so suddenly developed itself? There have been plenty of divisions which the Republican party have found no difficulty in attending; how is it that upon so important, or at all events so significant, an occasion as M. GAMBETTA's re-election so many of them were absent? The character of the occasion was perfectly well understood. Everybody knew that the result of the ballot would be closely scrutinized in order to detect whether M. GAMBETTA had lost ground with his party during the last Session. Now that the Right have no policy of their own, the only occupation left to them is to speculate about the policy of their adversaries, and M. GAMBETTA's position in the Republican party is one of the most important data attainable for constructing such speculations. It is quite incredible that, with this fact in their minds, the Republican deputies should not have got to the Chamber early enough to vote for M. GAMBETTA, if they had really wished to vote for him. They would for once have hurried their breakfast, if they had not had a special motive that morning for taking their time over it.

This special motive was plainly to convey to M. GAMBETTA their displeasure with some part or other of his recent conduct. What particular part they disliked differed, no doubt, according to the political and personal tendencies of the deputies. There is no need to look far for the reason why the Left Centre dislike him. M. GAMBETTA has as good as told this eminent and self-satisfied section of French opinion that their day is over. They have been accustomed to regard themselves as a reserve from which new Ministers are perpetually to be drawn, and M. GAMBETTA has made them see that, in his opinion at all events, the supply is exhausted. M. GAMBETTA has many reasons for desiring that M. DE FREYCINET's Ministry should last for some time; and if he had thought the support of the Left Centre in the Chamber, or their presence in the Cabinet, at all important from this point of view, he would have taken care that they were represented in the new appointments. The supposed value of M. WADDINGTON's services would have supplied a natural excuse for again offering him the Foreign Office, and M. LÉON SAY is certainly a more eminent financier than the gentleman who has succeeded him. The composition of the Ministry was consequently conclusive as to the future relations between M. GAMBETTA and the Left Centre, and this accounts probably for a certain number of absentees. The dislike of the Extreme Left to M. GAMBETTA seems to be quite as decided as that of the Left Centre. It is true that the tendency of the recent Ministerial changes has been decidedly in the direction in which the Extreme Left wishes things to go. But it often happens that men are more angry with those who go with them a certain part of the way and then stop short than with those who refuse to go with them at all. This feeling naturally becomes more decided when it is strengthened by personal considerations; and in the present case personal considerations must have a large space allotted to them. The WADDINGTON Ministry owed its fall to the attacks and defections of the Extreme Left. In the natural course of things, therefore, the leaders of the Extreme Left should have been called on to form a Ministry. As soon, however, as M. WADDINGTON had resigned, there went about a whisper that the leaders of the Extreme Left were impossible. In itself nothing can be more probable than this statement; but it is doubtful whether a man can ever be genuinely brought to think himself impossible. At all events, there is no evidence that the leaders of the Extreme Left had formed any such self-denying estimate; and, not having done so, it irritated them to see it formed by others. When a member of the late Cabinet was entrusted with the formation of the new one, and when the places which he did not fill by the re-appointment of his former colleagues were given to subordinate members of the Government of National Defence, the cup of bitterness overflowed. M. GAMBETTA was held responsible for the composition of M. DE FREYCINET's Cabinet, and the Extreme Left became eager to show him what they thought of the part he had played.

This may not have been the only motive actuating the deputies of the Extreme Left. They have to consider the votes given to them as well as the votes they give to others, and their abstention on Tuesday probably indicates the feeling entertained towards M. GAMBETTA by the extreme party in Paris. How large this extreme party is is another question; but that there is a section of Republicans among whom M. GAMBETTA's popularity has greatly declined is indisputable. It is the inevitable result of success in France that those who think themselves as good as you, but who have not persuaded the world to think so, are anxious above all things to pull you down from an eminence which they assume without inquiry to be undeserved. This is M. GAMBETTA's case at present. Some at least of his former followers are never weary of asking with CASSIUS, "Upon what meat doth this our CÆSAR feed, "that he is grown so great?" The reputation of M. GAMBETTA's cook and M. GAMBETTA's table adds point and pungency to the inquiry. It is of no use to tell the electors of Belleville that outward show is the natural and decent accompaniment of high place. Their object, so long at all events as they are excluded from high place themselves, is to proclaim that nothing of the kind is wanted, and that

if high place and outward show are inseparable, they had better both be abolished. They take no pleasure in the glories of their representative; rather they hold that, in accepting such glories, he has disqualified himself from being their representative. It is another question, we repeat, how large a part of the Extreme Left shares these views, or even whether, if those who hold them had an opportunity of giving serious effect to them, they would think it wise to do so. They may hold that they have not yet used M. GAMBETTA sufficiently, and that, until there is nothing more to be got from him, it is better not to throw him away. But the more they are actuated by this prudent feeling, the more pleasure it will give them to see M. GAMBETTA slighted. His re-election by so small a number of votes excellently serves their turn. They will be better able to endure seeing him escorted through the streets to the Chamber if they can whisper to themselves that, notwithstanding all his fine feathers, less than half the Chamber voted for him. It is even possible that this agreeable reflection may serve to some extent as a safety-valve for their wrath, and that they may be less angry with M. GAMBETTA snubbed than with M. GAMBETTA worshipped.

Speculations upon how M. GAMBETTA will take this indication of growing hostility among his own party can be of very little value until more is known of the particular object which M. GAMBETTA has in view. As yet no one can say with any confidence whether at this moment he is thinking most of winning the game or of taking a particular trick, and his tactics may be very different according as he is aiming at one or the other. He may wish to strengthen himself in the present Chamber or in the next. His thoughts may be chiefly turned to the deputies over whom he now presides or to those among whom he may hereafter play a different part. He may be meditating expedients by which to regain the confidence of the Extreme Left, or he may already regard the confidence of the Extreme Left as lost to him, and be considering in what quarter to look for its substitute. A man of M. GAMBETTA's fertility of resource is not to be judged by common rules. The proof that his hold on a particular position is weakened may suggest to him not that it needs to be strengthened, but that it is time to abandon it for another.

TWO MINISTERIAL SPEECHES.

THE choice, or the accident, which determined that it should fall to the lot of the FIRST LORD of the ADMIRALTY and of the CHANCELLOR of the EXCHEQUER to answer Sir WILLIAM HARCOURT cannot be said to have been unhappy. It is true that it would be difficult to find two champions more unlike the antagonist against whom they were matched; but in this very dissimilarity lies the appropriateness of the arrangement. Sir WILLIAM HARCOURT is nothing if not jocular; but his last appearance on the stage of political low comedy is not, we believe, considered even by his admirers to have been a successful one. If sarcastic eloquence of the superior kind were required, there are at least two members of the present Cabinet who (in a phrase which used to be a favourite one with Mr. CARLYLE) "have fire enough inside them" to consume Sir WILLIAM HARCOURT and all his works, without any diminution of their own temperature. But to bad jokes, or to bad attempts at joking, the best thing that can be opposed is plain common sense; and of this no better exponents can be found than Sir STAFFORD NORTHCOTE and Mr. SMITH. It happened too, very pleasantly, that at the exact time when the two Ministers were speaking an allegation of a very specific kind was being launched against the Ministry by one of the lesser lights of the last Government. Mr. BAXTER, at Forfar, complained of the "wild, "rollicking, Imperialist, and revolutionary spirit" of Lord BEACONSFIELD's administration. It will readily be admitted that the present CHANCELLOR of the EXCHEQUER and the present FIRST LORD of the ADMIRALTY are most admirable and typical examples of the wild and rollicking revolutionary.

There was not unnaturally a certain similarity between the topics to which the two Ministers addressed themselves. Sir STAFFORD NORTHCOTE indeed dealt with Ireland at greater length than his colleague, who in this direction mainly confined himself to the Home Rule question, while India and Afghanistan, with which Sir STAFFORD NORTHCOTE did not meddle, were taken up by Mr. SMITH. The announcement made by the CHANCELLOR of the EXCHEQUER respecting the Government plans for the relief of the distress in Ireland confirms, though not very explicitly, the rumours which were spread on the subject a week ago; but he does not seem to have touched the vexed question of the Church surplus. Mr. SMITH's remarks on Afghanistan consisted mainly in a short summary of the facts of the case, which was chiefly distinguished from the summaries to which his opponents have accustomed us by being not in the least pictorial, and by being strictly accurate. Both Ministers dealt with the subject of finance, and here again the general tenor of the two speeches and the kind of importance which may be assigned to them were the same. The opponents of the Government have made a very great point of its supposed financial delinquencies, and they have moreover urged that point in a somewhat curious manner. The intricacies of finance are really a sealed book to a good many people, and are taken as a sealed book by a good many more. Mere figures indeed do not daunt persons of ordinary intelligence; but it is felt that finance, in the imperial sense, is a question of arrangement and technicality which the profane outsider can hardly pretend to approach. The Opposition argument, therefore, takes this form:—"Here is an admittedly "great financier, who says that the finances are in a "terrible condition; who will dare to gainsay him?" The answer of course is that in finance, as in other matters, critical and constructive ability are two very different things. It is possible that in the devising of budgets, in the forecasting of the probable production of this tax, and the probable effect of diminishing or abolishing that, neither the present CHANCELLOR of the EXCHEQUER nor the present FIRST LORD of the ADMIRALTY may be Mr. GLADSTONE's equal. We are certainly not here concerned to argue that they are in these things his equals. But hardly the most audacious of partisans will deny to either of them the possession of ample ability and experience to qualify them for another task, the estimation of the actual present financial position of the nation. Neither Sir STAFFORD NORTHCOTE nor Mr. SMITH is a person at all likely to be deceived on a simple question of debtor and creditor accounts, however complicated those accounts may be. On the other hand, not even the extraordinary license which political controversy has recently permitted itself, will assert that either Sir STAFFORD NORTHCOTE or Mr. SMITH has forfeited the character of an honest man. The question, therefore, between the two parties stands for the layman in finance in this position. One critic—able, indeed, and experienced, but strongly prejudiced, and possessed beyond all other human beings of the faculty of persuading himself of what he wishes to believe—declares that the financial situation is terrible. Two critics—not wholly disinterested it may be, but cool, honest, and thoroughly qualified—declare that the situation is not terrible at all, but, considering all things, very tolerable. The average elector is in a position to decide very fairly on the question thus presented to him.

Ireland and Afghanistan, Home Rule and finance, however, occupied but a part of the two speeches, and on no one of these points did the speakers come so closely together as on the general question of foreign policy. Wearisome as the inevitable repetitions on this subject may be, there is no doubt that Sir STAFFORD NORTHCOTE was right in dwelling upon their necessity, and upon the still greater necessity of treating the subject seriously. It is scarcely too much to say that the persistent vociferation of the Opposition has succeeded in creating for some of their partisans what may be called an imaginary history of the last few years. The main incidents of this singular chronicle may be ascertained by inserting a negative into the propositions describing the actual facts. The history of 1876-1880, according to the orators of the Opposition, is that the Russians were not encouraged to go to war by the attitude of the English Liberal party or of any part of it; that they did not reach the gates of Constantinople; that they were not forced back from those gates by the attitude of England backed by the tardy approval of Europe when Europe saw that England meant what she said; that the efforts of the English Government have not been constantly directed to the carrying out of those pledges which they undertook eighteen months ago; and that the complications on the Indian frontier have not been forced upon Ministers by circumstances and persons over whom they had no control. It is not very easy to hit upon the best way of treating this

elaborate legend. If argument were required, the argument is ready to hand in a famous passage of Lord MACAULAY, in which that historian's defence of the Triple Alliance anticipates almost verbally the account of the present situation which impartial historians will have to give. If Russia was not stopped, "it is certain that the world "believed that she was stopped"; it is certain that Ministers have "succeeded in raising the credit of their country and "in lowering the credit of a rival Power"; that England has "regained a high place in the estimation of her neigh-"bours," and that "this change was produced by wise "and resolute counsels without the firing of a single gun." But against persistent repetition of fiction in the ears of persons, some of whom are not in a position to investigate the question at first hand, there is no such effectual defence as the steady repetition of fact. Such repetition, therefore, necessarily formed a considerable part of the speeches at Sutton and at Stroud, and will necessarily form a part of any other speeches which may be delivered at other places until the general election is over. The question, as Mr. SMITH put it, is whether England is or is not prepared to maintain her position as a first-rate Power, and probably it would be difficult to find any simpler and better way of formulating the test. For it is observable that this test is one which Opposition speakers rarely attempt to meet, and that when they do meet it or attempt to meet it in any way but by a direct or implied negative, they are immediately scolded by the more advanced members and organs of their party. To people who can only take an interest in the details and incidents, not in the main object, of a political struggle, it is to be feared that the controversies of the last few months and their probable repetition for some months to come will only be weariness. Nor is there any other means of avoiding that weariness than by keeping the eyes steadily fixed on the end. Controversies about this or that Blue Book and this or that letter may be a relief now and then to some people and a diversion to others. But the main thing, after all, for the defenders of the position of England among nations to do is to meet with steady contradiction and reversal the false assertions and the misrepresentations of late events which are now more than ever becoming the weapon of their opponents. In this irksome but necessary task the two Ministers who spoke on Thursday night were for the most part engaged; and, as each revival of the legend is brought forward, so will it be necessary to rebut it with a revival of the history. Hard pounding has done a great many things in this world, and by hard pounding, unless it is opposed by harder, it is even conceivable that Englishmen might be made to believe that the attitude of Mr. GLADSTONE three years ago did not encourage Russia, and that the Russian army which lay for weeks at San Stefano was a dream or an invention of Tory statesmen.

SOUTH AFRICAN AFFAIRS.

IF Sir GARNET WOLSELEY has resigned his South African government, his services to the country in his latest employment will have been incomplete both at the beginning and at the end. It was no fault of his that the war with CETEWAYO was finished before he could reach the head-quarters of the army. The success of his subsequent enterprise against SECOCOENI was well deserved, and he has been fortunate in securing the persons of both the hostile potentates. Perhaps Sir GARNET WOLSELEY entertains a not discreditable preference for military over political employment. It will be for the Home Government to consider whether the affairs of the Transvaal shall once more be entrusted to Sir BARTLE FRERE. There is no reason to fear that he will precipitate a war with the malcontent Boers, with whom he has, as far as possible, maintained friendly relations. He defended their interests with doubtful justice in the matter of the arbitration with CETEWAYO, and he evidently feels a whimsical sympathy with the Puritan element in their character. No other English administrator of equal rank could have propounded the remarkable doctrine that the Boers acquired a kind of title to the lands of neighbours whom they compared to Canaanites, by assuming to themselves the privileges of the Israelite invaders. Sir BARTLE FRERE seems to have in some degree allayed the hostility of the Boers during his visit to the Transvaal; and probably no other representative of the English Government could exercise equal personal influence. The chief objection to the renewal of his commission would probably consist in the uncertainty whether he would implicitly follow his instructions. If he should fortunately share the opinions of the Government at home, he ought to be preferred to any competitor. His popularity with the Cape colonists would furnish a strong reason for employing his services in solving the difficult problem of the Transvaal. It would be extremely undesirable to alienate the good will of the Dutch inhabitants of the Cape by any measure which they might deem unjust to their neighbours and kinsmen. They might perhaps be disposed to listen to friendly representations of the increase of political influence which they might derive from federation with another Dutch population. Up to the present time the Colonial Parliament seems to have expressed no opinion on the Transvaal controversy.

Though the Governor or Commissioner of the Transvaal will have abundant opportunity for the exercise of sound judgment and diplomatic ability, the question of maintaining or abandoning English sovereignty must be decided at home. The Government will be required to announce its decision as soon as Parliament meets; and in the meantime the reasons for and against either course of action cannot be too carefully considered. Mr. FROUDE, who had been erroneously supposed at the time to be an advocate of annexation, has lately recommended in strong language the retractation of a proceeding which he denounces as unjustifiable and unwise. Nearly everything which has been done in South Africa equally incurs his censure; and the Dutch especially, both within and without the limits of the colony, may cite his authority in support of the proposition that the English Government has been systematically wrong. Freedom of speech and writing is an excellent thing, but it sometimes throws great difficulties in the way of government. It is not demonstrably necessary that an able and honest man, possessing special knowledge of a political subject, should publish to the world all the conclusions which he may have formed. If the Dutch of South Africa have at any time been ill treated, they are now subjects of the QUEEN and fellow-countrymen of the English settlers in the same provinces. It seems scarcely the business of an eminent Englishman to remind them of their grievances. Absolute or oligarchical Governments have some advantage in the facilities which they possess for obtaining confidential advice. Since the fashion arose in England of conducting affairs, not even through Parliament, but by means of public meetings, all political secrets are proclaimed in the first instance from the house-tops. Those who have no interest except the promotion of the public good and the maintenance of national honour would by preference rely rather on the responsible judgment of the Cabinet than on the opinions which Mr. FROUDE may have disseminated among his audience at Edinburgh.

The majority of the Dutch farmers of the Transvaal have proclaimed their antipathy to English rule in a form so practical that it constitutes an act of treason on the part of their leaders. Mr. PRETORIUS, Mr. KRUGER, and a colleague named BOK have been arrested on the charge of having summoned an Assembly to undertake the government of the country. Whatever may be the moral quality of the proceeding, it would be difficult to imagine a more direct defiance of the law. It may be hoped that some settlement of the main dispute will anticipate the necessity of a trial. It was impossible for the local Government to pass over a challenge which denied its authority or its existence. Even if the annexation should be eventually revoked, it would be absurd to acknowledge that it was originally void. Sir GARNET WOLSELEY's statement that the Transvaal would be administered as a Crown colony was perhaps the foundation of Mr. GLADSTONE's excited protest against an imaginary project of despotism. If the province is to be retained, it must be governed by some means, and it certainly cannot at present be governed, consistently with allegiance to the Crown, by representatives of the population. The real issue relates, not to the temporary mode of administration, but to the permanence of English sovereignty. Some of the reasons which are alleged for retaining the Transvaal at any cost may be safely disregarded. A retractation, though it would involve an admission of error, might well be the smaller of two evils. The comments which might be uttered by foreigners on the supposed proof of the decay of Eng-

lish power would be harmless plagiarism from Prince BISMARCK'S reported criticism on the cession of the Ionian Islands. If the Boers attributed to fear an act prompted by feelings of justice, their opinion would not affect the judgment of any serious politician. Some presumption in favour of abandonment is raised by the almost universal conviction that the annexation was precipitate. It is true that the objections to the measure then raised by the representatives of the Boers were neither earnest nor general; but the assumption of authority by Sir THEOPHILUS SHEPSTONE was sudden, and it would be unfair to take advantage of surprise. It seems that a majority of the Dutch settlers now entertain a strong dislike to the establishment and maintenance of English authority. Some of those who join in the agitation may probably be acting under coercion; but the prevailing opinion can scarcely be mistaken. If the only parties to the dispute were the English Government and the Boers of the Transvaal, it might perhaps be prudent and just to accede to their demands. It is for the Government and Parliament to ascertain whether the more complex interests concerned in the question can be reconciled with the restoration of the Republic.

Although the land is occupied in large and isolated tracts by the Dutch farmers, the traders and the artisans, who form the population of the petty towns and villages, are for the most part English, and are unanimously favourable to the maintenance of English sovereignty. The assertion that they would resort to armed insurrection if they were remitted to the government of the Boers is not in itself incredible, though perhaps it may have been made on insufficient grounds. The Chamber of Commerce, which states that the trade of the country amounts to two millions a year, some time since presented an address to Sir BARTLE FRERE, in which its members strongly deprecated the withdrawal of English authority. Their number, and the amount of property which they represent, is one of the subjects on which accurate information is desirable. Another and perhaps greater difficulty arises from the unsatisfactory relations of the Boers to the natives. Mr. FORSTER has opportunely called attention to the fact that the natives form an enormous majority of the population in a province which the Boers regard as exclusively their own. It may be doubted whether the protection to which the natives are entitled can be given except by an actual Governor. Probably the main objection of the Dutch farmers to annexation is derived from the knowledge that the English Government will prohibit both unauthorized border wars and the modified form of slavery to which they are accustomed. Although they might perhaps agree to conditions imposed on the restoration of independence, there would be no means of enforcing the performance of their provisions. No population of European descent is perhaps so impatient of any kind of government. Each head of a family lives, like the CYCLOPS in the Odyssey, far apart from neighbours, and almost unacquainted with taxes and with laws. Their last President complained that they would neither serve against the enemy nor provide means for the common defence. If they are left to themselves, they will probably relapse into the anarchy which was the cause or the pretext of annexation. All these various or conflicting elements in the controversy must be taken into consideration. The annexation was sanctioned by an overwhelming majority when it was first communicated to Parliament; but later experience may have modified the judgment of many persons. The most positive and unhesitating conclusions will probably be the least valuable; and it may be hoped that Mr. GLADSTONE will stand alone in imputing to the Government a disinterested passion for despotism.

TRADE PROSPECTS FOR THE NEW YEAR.

THE New Year has opened more hopefully for business men than any of its predecessors since the end of the inflation period that followed the Franco-German war. Prices and wages, indeed, are still very low, and trade is much restricted; especially there is little or no increase in home consumption. Yet there is a decided access of activity in manufacturing industry, and the tone of business men is cheerful. On this latter point the annual trade circulars just issued leave no doubt. Thus respecting Scotch iron we are told that, while the average number of furnaces in blast last year was only eighty-eight, there are now at work one hundred, "and there are indications that our "productive power will be still further increased during "the spring months." It is added that the shipments and railway deliveries show an increase of 130,000 tons compared with last year. Again, a report upon the jute and flax trade states that the advance in prices since the autumn has been very considerable. And another report on the shipping trade runs thus:—"For the first time "during the last four years we are enabled to congratulate "our friends upon an existing cheerfulness in shipping 'circles, founded on a steady, solid improvement in business generally, and what may be not unreasonably 'considered a positive termination of that period 'of settled gloom and stagnation in trade which 'for a weary time seemed to bar all hope of change 'for the better." It would be easy to go on to any length adding to this kind of testimony; but we have said enough to show what is the prevailing opinion in business circles. If we turn to the market reports, we find abundant support of this opinion in the decided increase of activity. From all quarters we hear of briskness in every branch of the iron industry. In tin last week there was a further advance in the standards. Orders for new iron ships continue to be received. In wool the demand for home manufacture and for export is improving; and from Manchester we learn that a large business in cotton was done last week at advancing prices. All the other indications of the state of trade point in the same direction. The traffic receipts of the railways exhibit a very general and marked increase. The bank dividends already declared for the past half-year show that, in spite of the low rate of interest, the profits realized have in general been equal to those of the last half of 1878—a time when the value of money was exceptionally high. This result can have been attained only by a very considerable increase of the business done. And we may add that bankers, than whom none are in a better position to form a correct opinion of the actual state of trade, are almost without exception disposed to take a favourable view of the prospects of the immediate future. Lastly, the Board of Trade Returns for December show that the improvement which set in in July continued at an accelerated rate to the very close of the year, the increase in the value of the exports, for instance, being nearly twice as great as in November, and being much more than twice as great as in any previous month. In the imports, also, there has been an enormous increase since September; and this is not due solely to augmented purchases of food, for the imports of the raw materials of manufacture—such as cotton, flax, hemp, raw silk, and wool—have also very largely increased. This double increase in the exports of manufactured goods and in the import of the raw materials of manufacture is decisive as to the state of trade. Profits must be fairly remunerative, to say the least, or manufacturers would not thus be preparing to enlarge their outturn. Even the enhanced value of the food imports of late months is not to be set down altogether to the bad harvest, much less is it to be regarded simply as an unfavourable sign. The paralysis of credit which followed the Glasgow Bank disaster caused a shrinkage in all business—in that in articles of food as well as in other things; and the recovery shown during the past four months really, therefore, affords evidence that the shock to credit has been completely got over. Moreover, the increase is not in bread stuffs alone; there is a very large augmentation, for example, in tea, which certainly cannot be considered an unfavourable sign.

The evidence thus afforded by trade circulars, market reports, traffic receipts, bank dividends, and the Board of Trade returns, all points to the same conclusion, that there is a very real and marked improvement in trade. Can it also be considered lasting? It is perhaps too soon yet to answer this question with confidence, but the improvement has lasted too long already to be regarded as a mere spurt. It began, as may be recollected, with the large purchases on American account, in the latter part of the summer, chiefly, but not exclusively, of iron and steel. These purchases came at a time when prices generally, as Mr. GIFFEN has shown, had fallen to a lower level than had been known since the great gold discoveries; and when, therefore, it is not unreasonable to infer that they had sunk below what the circumstances really warranted. In like manner, wages had been cut down with an unsparing hand. Economies had been enforced in every department of business, and production had been restricted to the measure of the existing consump-

tion, if not even below it. To take a single instance, out of 154 blast furnaces in Scotland, the average blowing last year was only 88. In this state of things it was inevitable that even a slightly increased demand should have a very considerable effect. The large American purchases operated in another way. During the long period of stagnation and weak credit, traders generally had allowed their stocks of goods to run down, and the first symptoms of a better demand naturally compelled them to replenish. Further, it is to be borne in mind that in all depressions the psychological element plays a very great part. The fear of loss, the suspicion that customers are not to be trusted, the apprehensions excited by rumours of failures, are quite as influential in checking business as actual losses themselves. While such is their temper, bankers restrict the accommodation which they afford to merchants, and merchants, in their turn, are obliged to limit their transactions in proportion to this restriction of credit. In many cases, too, hard cash is insisted upon before goods will be parted with. Now in the course of last summer this distrustful state of mind began to pass away. The liquidations of 1875 and of the last quarter of 1878 had cleared away so much of the bad business which had previously accumulated that confidence began slowly to revive. It was completely restored when the American purchases gave a sudden stimulus to the iron trade, and imparted value to properties which a few months previously had appeared worthless. The transition was rapid and its effects were great. Facilities of credit long withheld not only enabled legitimate trade to expand, but gave speculators the means to step in and exaggerate the improvement. Still, although speculation was active, a considerable part of the movement was real. Another influence which helped the revival was the improvement in the silver market, owing to the stoppage of the German sales of the metal. This improvement not only lessened very greatly the losses of merchants trading with the silver-using countries, but it relieved the Eastern banks from very grave difficulties. In the last place, the cessation of famines in India and China and the improvement in the condition of the vast populations of those countries gave a stimulus to the Eastern trade. The causes tending to produce a business revival are thus many and powerful, and we should consequently have no hesitation in coming to the conclusion that the improvement which we witness will prove lasting, as it is already substantial, were it not for two drawbacks of very formidable magnitude.

The first of these is the agricultural depression. In past times economists were accustomed to regard a good harvest as essential to the prosperity of trade; but we have now had four bad harvests in succession, and the last is also the worst that has been known by the present generation. Nor is it only the corn crops that have been bad. The year has been a disappointment to farmers in almost every particular. It is hard to believe that this moment of agricultural depression will also prove to be the beginning of a great trade revival. It is to be borne in mind, however, that we have long ceased in this country to depend for our food upon the produce of our own soil. Even in good years we import half the bread we eat, and the quantity of meat, butter, and cheese which we draw from abroad increases constantly and steadily. The additional food we shall have to buy this year does not therefore make so much difference as at first sight might be thought. In former times a bad harvest checked trade because it raised exorbitantly the price of bread, and thereby left the working classes so little money to expend upon other things that the trades dependent upon them suffered severely. But the rise in the price of bread this year has not been material. In fact, the blockade of the South Russian ports during the Russo-Turkish war had practically as great an influence as our last bad harvest. Were this the only effect of the bad harvest, then it could not materially check trade. But, following as it did on a series of bad harvests, it has aggravated the agricultural depression in this country, and in Ireland has produced distress so dire as to be bordering upon famine. When we bear in mind that agriculture is still the greatest industry in the United Kingdom, it is clear that its depression must have a serious influence upon the general prosperity. The agricultural classes have not the means of spending on their usual scale in the towns, and necessarily the towns must suffer in consequence. It is then a very interesting problem whether the revival of trade can prove lasting. The other drawback to which we have referred is presented by the political condition of the Continent. It would be out of place here to inquire what are the real relations between Germany and Austria, on the one hand, and France and Russia on the other, or whether there are grounds for the apprehensions of war which so widely prevail. But our examination of the trade prospects of the new year would be incomplete without a reference to those apprehensions. Business men have to take into consideration, when planning operations that will occupy much time, the chances of peace and war; and should the latter preponderate, the inducement is to keep their capital well in hand. The prospects of the new year, then, are brighter or darker according to the estimate that may be formed of the probable action of the great military Powers.

UNREDEEMED ITALY.

THE *Italia Irredenta* movement, which all moderate people hoped we had long heard the last of, has lately received an unexpected impulse. General AVEZZANA, a leader of the cause, died recently. His funeral at Rome was largely attended, and among the chief mourners were two members of the Italian Cabinet. There was nothing in this that can be called more than indiscreet, for the honour was professedly paid to the man, and not to the cause with which he was identified. It is also alleged that it was stipulated by the Ministers that the funeral should not be made the occasion of any political demonstration. But when the ceremony took place the bargain, if made, was not kept; the flags of the party, as well as Republican flags, were displayed; disturbances took place which called for the interference of the police; and the Ministers who took part in the proceedings were gravely compromised. But the matter did not end here. Signor IMBRIANI, the President of the *Italia Irredenta* Association, has since published a statement in which he declares that, in a previous interview with one or two members of the Italian Ministry, he received assurances from them that the aspirations of his party were shared by the Government, and that it was only the weakness of Italy which led them to think any immediate action in the matter inopportune. To this statement of Signor IMBRIANI a categorical denial has been given officially by the Italian Government; and although this denial has not met with universal credence, either in Italy or abroad, it is only fair to suppose that between the two parties who thus flatly contradict one another there is no more than such a misunderstanding as may arise among honourable men. This, however, is a point which Signor IMBRIANI and the Italian Cabinet may be left to settle between themselves. But in the present critical state of European politics anything that tends to a breach of the peace between two Great Powers has an interest for all of them; and this unlucky incident will lead many persons to think afresh on the relations of Italy and Austria, and on the reaction which any quarrel between them might have on the general affairs of Europe.

From 1815 to 1866 Italy and Austria were natural and irreconcilable enemies. Until the war of 1859 Austria ruled directly over two of the richest Italian provinces, and exercised a decisive influence over the policy of all the other Italian States, with the single exception of Piedmont. But in 1859 Austria was driven from Lombardy, and the smaller Italian States, which had been virtually her vassals, were absorbed into the new kingdom of Italy. In 1866 she was forced to surrender Venice. The result was a happy one for Austria, for Italy, and for Europe. The expulsion of Austria from Italy and from Germany has turned her course eastwards, where it is probable that a great future awaits her; it has changed the old rivalry and enmity with Prussia into an alliance which has every natural element of stability about it; and it has removed two of the standing dangers to European peace. Italy, which had been suddenly transformed from a geographical expression into a Great Power, had a work of organization set before her at home, and has still, which will give her peaceful employment for many years to come. If there is a Power in Europe without a grievance against its neighbours, which enjoys the sympathy and good wishes of other countries, and the internal condition of which imperatively demands a peaceful foreign policy, that Power is Italy. And yet Italy has contrived to make herself an object of suspicion to Austria.

and is generally talked of in the English and Continental press as a country likely to have a hand in the next European war. And the sore point from which all this mischief is to spread is *Italia Irredenta*.

Unredeemed Italy is a term of elastic significance. In the mouths of some it appears to mean only the Trentino, and the East coast of the Adriatic in the neighbourhood of Trieste. In the mouths of bolder or more imaginative believers it includes in addition Nice, the Swiss canton of Ticino, and the island of Malta. To carry out the programme of the party, war with Austria, France, Switzerland, and England, either separately or simultaneously, would be requisite; since it is to be presumed that none of these Powers would make a present to Italy of the provinces and the island in question. Put in these terms, the programme of the party is too absurd for discussion; since there is not one of these Powers, except Switzerland, which could not with the greatest ease hold its own against Italy, and do Italy incomparably more mischief than Italy could inflict upon them. Switzerland is maintained by Europe as a neutral State; but, even if Switzerland were left to its own resources, it is very doubtful whether Italy could wrest the Ticino from that fearless and stubborn little State. Further, the party which raises the cry in Italy does not number in its ranks a single one of the serious and responsible Italian statesmen. It has the blessing of GARIBALDI; but the old hero is recognized all over Europe, and nowhere more than in Italy, as a man whose political part is solely revolutionary. Moreover, apart from the impracticability of the programme, its justice is more than questionable. Trieste has been for close on five hundred years in possession of the House of Austria, and never formed part of Italy at all. The Trentino has been for centuries in the same hands, and its capital is only known to the majority of persons as the place where the great Council was held under the auspices of CHARLES V. The Ticino is in great part an old conquest made centuries ago by the Forest Cantons of Switzerland. More could be said in favour of a war with France for the recovery of Nice, mad as that would be; but it is against Austria, whose claim to the so-called unredeemed provinces is as good as any historical claim can be, that the chief efforts of the party are directed. It is true that there is no evidence to show that the population of the chief Austrian seaport or of the Trentino are anxious to break the old historical tie which connects them with the House of Hapsburg; but these are details which people who march in processions and wave flags do not trouble themselves about. It is true that the principle of nationality, like all other principles, cannot be carried out in practical life except roughly and with many exceptions. It is true that one of the toughest States in Europe, Switzerland, exists and has existed for centuries in direct defiance of this principle, and that in hardly one State is it carried out with logical completeness. If, then, the programme is so silly and the men who preach it so insignificant, where does the danger of it lie, and why should we trouble our heads about it?

It lies in the fact that Italy is a country with Parliamentary institutions, and a country in which the political centre of gravity lies in Parliament. The Crown in Italy is a cipher; and the praise has been justly earned by the excellent man who now occupies the throne that he contents himself with subscribing, on true constitutional principles, to all that his advisers set before him. Among the leading politicians in Italy there are men of great talent and high character; but there is no one with the prestige and the influence to make Parliament and the country follow him; and the men of most experience and influence happen to be out of office. Political parties in Italy are in a state of almost hopeless and inextricable confusion, divided from one another by no principle, animated by no idea, aiming at no end. They are likely to remain so until the Clerical party comes forward to take an active share in public life, and thus gives Parliament something to fight about. But at present the question is, Who shall be Minister? It is this and nothing more. The new Minister is not expected to do anything which the one whom he supplants did not or could not do; but he must partake of the cares and the sweets of office. When rivalries are excited, and when chances are evenly balanced, the temptation to win by any means becomes irresistible. Hitherto the *Italia Irredenta* cry has been a good card to play. The Ministry could, on the one hand, give the extreme Radicals ground to hope that it shared their aspirations, and thus win their support; and, on the other, it could always, in private explanations with the Austrian Ambassador, and in official utterances in the press, represent the movement as merely the work of a few hot-headed and irresponsible demagogues, whose acts a constitutional government cannot always control. The time comes in the end when this double game can no longer be played; but for awhile it answers. If Europe were tranquil, there would be no reason to give a second thought to what is at bottom merely a move in Italian home politics. But, unfortunately, all Europe is armed to the teeth; and any spark may light a train which will set the whole Continent in a blaze. It is this fact which gives to any connivance of the Italian Government at this movement a character of extreme and criminal folly. Should the movement go on much longer with the collusion of the Cabinet, no one would blame the Austrian Government for striking first and striking hard. Italy is not strong; but just as the *Italia Irredenta* party may turn the scale in home politics, so Italy may turn the scale in a European war. The mere fact, moreover, that this movement goes on unchecked year after year, however it may be disowned by responsible statesmen, must inevitably breed bad feeling between Italy and other countries, and must inevitably lead the mass of the Italian people, who are both ignorant and imaginative, to fancy that they are wronged by Trieste and Trent not forming part of the kingdom of Italy. Nor, indeed, are the antecedents of the men now at the head of affairs in Italy reassuring. The time was when their natural place would have been at the front of the *Italia Irredenta* party; and, though some old Republicans and Mazzinists are now among the safest and most cautious members of the moderate party, there is no evidence that a similar conversion has taken place in the case of certain among the present Italian Ministers. It would probably be as great an aspersion on their character as it would be a compliment to their intelligence to suppose that they are devising Machiavellian schemes for remodelling the map of Europe. But little causes and unwise persons may do a great deal of mischief; and further coquetting with this agitation may give the Italian Government unpleasant proof that it has been playing with edged tools. An unredeemed Italy there is, of which anybody who takes a walk through the streets of Naples may see a specimen; it is thence, and not from Trieste and the Trentino, that the *grido di dolore* ascends to which, on a memorable occasion, the House of SAVOY declared that it could not be insensible.

FOOD AND FLEETS.

THE long period of commercial stagnation which this country has but just left behind has been marked by an extraordinary absence of serious distress. All the ordinary causes of distress were present in abundance, but not the distress itself. Wages were low, and work was exceedingly slack. The best thing almost that could happen to an artisan was to be employed three days a week, for the alternative commonly was not to be employed at all. Yet, in spite of this, there has been no very startling increase of pauperism, no large recourse to private charity, and no appeal whatever for Government aid. The working classes have come through their trouble poorer, no doubt, in many cases by the exhaustion of their savings, but with infinitely less sacrifice of independence than has ever been known in any similar circumstances. There can be no doubt as to what has been the main cause of this good fortune. No amount of previous frugality would have enabled the English artisans to stand up against so long-continued a depression if the cost of living had not grown less as the means of living became harder to find. Prices, especially of food, were so low that a man working half-time might be almost as well off as a few years before he would have been when working whole time. Distress in its worst forms can hardly be general in England so long as bread is abundant and cheap, and during the worst pinch of the recent distress bread was very cheap indeed. Speakers at agricultural meetings who hint their regrets that protective duties have been unwisely abandoned have evidently never considered what would have been the state of the country if they had been still in existence. With bread selling at a price which would have yielded a profit to the English

farmer, the inhabitants of the manufacturing and mining districts must have starved. That England has been saved from wholesale depopulation, or from serious disturbance, is the result of Sir ROBERT PEEL'S legislation. Never have the benefits of Free-trade been so manifest as at the very time which a few short-sighted politicians have singled out for decrying it.

There is one circumstance, however, connected with Free-trade which has been brought into less pleasant prominence by the experience of the last three years. It has often been asked by Protectionists what England would do if she found herself at war with another maritime Power. So long as America is able and willing to send us as much corn as we want, it matters nothing to the consumer whether or not it pays the English farmer to grow corn. If it does not, that is only a reason why the farmer should grow something else instead. If the American producer can undersell him in wheat, or even in beef, he may in his turn undersell the American producer in vegetables or in dairy produce. But in the event of England being at war, this cheerful way of looking at the question would plainly be out of place. A whole population cannot be fed on early vegetables or on eggs fresh from the nest. The quartern loaf is the only thing that can do the work on a sufficiently large scale, and the quartern loaf is no longer to be had within the four seas. It is made for the most part of American wheat, and that wheat must be brought to this country before it can be turned into bread. It is useless to talk of breaking up pastures and laying down land in wheat once more. That might serve our turn if we were still in the days when the next longest thing to a war was the preparation made for waging it. But, if England were engaged in a conflict conducted on the latest models, the whole business—preliminaries, fighting, and negotiations for peace—might be over in less than a year; in less, that is to say, than the interval between one harvest and another. Where would the food of the nation come from during that time? Where, for example, would it have come from if we had found ourselves at war with a Great Power last autumn? We must either have drawn our supplies from the same quarters which are yielding them now, or have gone without them altogether. One look at the figures which tell of the weekly import of wheat from the United States, and of that "visible supply" which is to furnish the imports of future weeks, is enough to make this plain. With this source of food closed against them, the great majority of Englishmen must have starved. The moment that war had broken out, an adversary, if he commanded any naval strength whatever, would have devoted the whole of it to closing this supply against us. In no possible way could he have served his own ends so well, or compassed our defeat so easily. Supposing him to have succeeded, there would have been nothing for it but to sue for peace. If once the Government had been confronted by the alternative of submission or famine, no amount of resolution would have availed them anything. They might have been willing to choose famine in their own persons, but they would speedily have been set aside in favour of a Cabinet cast in a less heroic mould.

A Protectionist—he is no longer to be reckoned among extinct forms of life—will say that this is precisely the danger which he has always foreseen as the natural result of Free-trade legislation. He may in part be answered by the retort that it is better to starve in war-time once in half a century than to starve in peace whenever there is a bad harvest. If it had not been for Free-trade, England must have lost her place among the Great Powers. She could not have supported her population without more food than she can count upon raising within her own borders; and she could not have carried on her trade without her population. The real way of meeting the difficulty is not to calculate impossible chances in the direction of a duty on corn, but to make the chance that we shall ever be cut off from our foreign supply as good as impossible. We need never be in any danger of having our wheat intercepted if we take the simple precaution of having a superior fleet always ready to defend the grain ships against an enemy's attack. Given that simple condition, we are as safe against famine in time of war as though we had never given up protective duties, with the additional advantage of being immeasurably better guarded against it in time of peace. In theory, of course, this is not a matter upon which any difference of opinion exists among Englishmen. Even the Committee of the Peace Society would probably admit that, if we found our food supplies in danger of being cut off, it would be lawful to employ ships to ensure their safe landing, and that, as ships of war cannot be built at a moment's notice, it is lawful to keep a sufficient number of them in a state of permanent preparation. What is not so certain, unfortunately, is whether Englishmen are in the habit of estimating the number of ships that would be required for this purpose alone, and how many could be spared for this purpose from our present navy. No doubt we have a large and very costly navy afloat; that is not denied. But, large as it is and costly as it is, is it large enough to answer all the purposes which in case of need it would have to answer? It must be remembered that, if England were at war with a maritime Power—perhaps with two maritime Powers at once—she would not be in a position to send her whole navy to protect her commerce with food-producing countries. Her ships would constitute an indispensable element in her offensive strength, while, as regards both her own shores and those of her colonies, they would also constitute an indispensable element in her defensive strength. With one considerable fleet engaged in bombarding an enemy's ports and another busy in protecting our own coasts against even the possibility of invasion, and a third cruising in Indian or colonial waters, how many ships could be spared for the yet more essential work of convoying grain ships from America? It may be answered that this, as being the most essential of all the functions which the fleet would have to discharge, would be, so to say, a first charge on our naval resources. Then which of the other three is to be neglected? Are we to forego what might conceivably be the only means open to us of crippling our adversary, or to leave our own coast undefended? Or, if neither of these duties are neglected, which of the colonies is it that is to be left a prey to the sudden descent of some daring commander? What is needed, if the food supply of the country is to be really secure in time of war, is a navy strong enough to spare all the ships that are wanted for the protection of the grain ships without unduly weakening any one of the three other fleets that will have each its work marked out for it. Can this, or anything like this, be said of the English navy in 1880?

IRISH DISTRESS.

THERE can unhappily be no doubt that the distress in Ireland is rapidly becoming greater. There is a marked difference between the tone of the Duchess of MARLBOROUGH'S first appeal for contributions towards the relief fund and the tone of her letter to the Mayor of SHEFFIELD. No hope is now expressed that the distress will be either slight or temporary. The DUCHESS catches, we may almost say, at the opportunity given her by the monthly meeting of the Sheffield Town Council, to bring home to the MAYOR how "pressing and increasing" the distress is likely to become. "There is no doubt that "by the month of February there will be no potatoes left, "as they are now eating their seed potatoes." This is in every way a very serious piece of news. It shows that the people are consciously preparing for themselves another famine—at all events, of potatoes—next year, and we may be sure that they would not do this as long as any other expedient was left them. It shows further how small the remaining stock of food must now be compared with the time that must pass before these peasants can raise any more for themselves. They are separated but by a very few weeks from sheer starvation, and when that comes there seems to be no way of escape from it for large numbers, except such as may be afforded by private charity or Government aid. The miserable agitation of which Ireland has lately been the prey has added to the misery that exceptionally bad seasons would anyhow have created. The landlords are at once less disposed than usual, and less able than usual, to give effectual aid. Under any circumstances they would have been the poorer by the rents which their tenants could not pay, and as it is they are also the poorer by the rents which their tenants have not chosen to pay. The knowledge that some, at least, of the defaulters are men who could pay if they would does not tend to make a landlord a merciful critic of excuses which have a better foundation. He is aware that the distress is in part fictitious, and he is tempted to jump to the conclusion that it is all so. Men who are poorer than usual, and are besides smarting under a sense that their poverty is due to a lawless agitation, are not likely to be

trustworthy authorities as to the extent of distress among those whom they hold to have robbed them. And, even when they admit the existence of great distress, they may not in all cases be very prompt in their preparations for dealing with it. Some allowance must be made for loss of temper, even in men of a naturally kindly disposition. Nor will there be wanting men whose disposition is not naturally kindly, and who will refuse to admit the existence of distress as long as they can, with a view to being excused from relieving it.

There is reason to fear that the just anger excited by the proceedings of Mr. PARNELL and his fellow-agitators has had its natural result in drying up English charity. It is true no doubt that a very large number of persons have less spare money than usual; but, considering how rapidly money has come in for the relief of famine in India when times at home were not particularly good, this is hardly a sufficient explanation of the present state of the Irish subscription list. There is no doubt a feeling on the part of a good many Englishmen that the attitude of the Irish peasant may be summed up in the formula, "Your money and your life." When a landlord asks for his own, the tenant threatens to shoot him; when the claim is abandoned in despair of enforcing it, the tenant asks for alms. Like most epigrammatic methods of stating actual facts, the formula is very far from being correct. The people who are really to blame for not paying their rents are not in distress, and so will not come in for a share of the relief; and the people who do come in for a share of the relief prove by that very fact that they were not in a position to pay rent when it was asked of them. The gist of the charge against the anti-rent agitation is that it is political as well as economical, that it is promoted by men who have the money in their pockets all the time as well as by those who have no means of raising it. In point of law, of course, a tenant who cannot pay is as proper an object of eviction as a tenant who will not pay. The landlord has a clear right to get rid of him if he is so minded, and to appeal to the police to help him if he cannot succeed without them. But it is not the simply destitute tenant that moves the anger of Englishmen. They can make allowance for violence when it is resorted to by men who see nothing but the workhouse in front of them unless they can somehow cling to their holdings. The violence for which Englishmen are not inclined to make allowance is the violence done or threatened by men who are not destitute, and whose motive for refusing to pay their rent is either that they prefer to put the money to some other use or that they do not wish to be unpopular with their neighbours. If these men were suddenly reduced to great necessities, it might go hard with them if they depended on English charity. But there is not the least reason to suppose that any of them have been thus reduced. The people who are now needing help are suffering from perfectly genuine destitution, and English charity must have woefully changed its character if it does not recognize the paramount force of this claim. Unless English charity has fallen off or remains wilfully blind to the urgency of the appeal now made to it, the subscriptions to the Duchess of MARLBOROUGH's fund ought shortly to be expressed in very different figures from any that have yet appeared.

It is to be wished for more reasons than one that private charity could have rendered any action on the part of the Government unnecessary. But it must not be forgotten that it is the Government that will, in the long run, be held responsible if Irish distress passes into Irish starvation. Even in India, where the principle of a Poor-law has never been formally recognized, the Government undertook to keep the people alive, and, so far as they are not relieved of this duty by others, they cannot do less for the people of one of the three United Kingdoms. The Poor-law is designed to ensure that in England, Scotland, and Ireland no one shall die of destitution, except of his own free will. The administration of the Poor-law is much stricter in Ireland than it is in England or Scotland; and, as a rule, we have no desire to see this difference effaced, except by an extension of the Irish practice. But in cases of exceptional scarcity, where vast numbers of persons have to be kept alive for long periods, it is impossible to forego outdoor relief. There are not workhouses enough to hold the people who have to be fed, and it would not be expedient to force them into them even if there were. The fear is, not that the Government will refuse to give aid to the distressed districts, but that they will not give it until the dimensions of the distress have become almost unmanageable. They have already offered to lend money to landowners who are willing to spend it on works which will at once improve their estates and give employment to the poor of the neighbourhood; and they now offer to consider any representations that may be made to them by Boards of Guardians setting forth the existence of exceptional distress from want of labour, and, if these representations are made good, to lend money on liberal terms for the immediate execution of useful public works. The obvious objection to this arrangement is that it will need time that can ill be spared to bring it into operation. The Guardians are to represent the existence of distress to the Local Government Board; the Local Government Board are to report to the LORD-LIEUTENANT that the representation is correct; the Commissioners of Public Works are to consider what works are needed in the district from which the representation comes; the LORD-LIEUTENANT is to convene an extraordinary meeting of the Baronial Sessions in which the distressed Union is situated, and to present a schedule of works which have been approved. The Guardians, the County Surveyor, or any two cesspayers may then make application for their execution. This is an excellent system for enabling as many public departments as possible to take part in the interesting work of relief; but, if the object is to find food for people who are starving, it is certainly open to the objection of being a little tedious. If it is worth while to send relief at all, it would be wiser to send it while those it is designed to benefit are still alive.

LITERARY PUFFING.

IT is not easy to say offhand what constitutes a "puff." People often use the word loosely for any kind of praise that seems to them extravagant. But a mere excess of commendation would hardly amount to puffing, in the stricter sense, unless we had reason to suspect that it was due to some distinct personal bias. Thus, for example, if a good-natured critic greatly overrated a book or picture through mere ignorance, sluggishness of judgment, and a general disposition to think well of mankind, we should not say he had written a puff. To speak technically, a part of the "essence" of puffing is the presence of a distinct personal bias in favour of the particular work that is eulogized. This bias may run riot, so to speak, and present itself nakedly as a conscious intention to cry up the production independently of any serious examination of its merits. This is puffing in its largest and fullest sense. Besides this there are less obtrusive shades of puffing in which the prepossession acts more disguisedly and without producing a conscious resolve to extol at all costs. In these cases the critic may half bring himself to believe that he has carefully examined the merits of the particular work and is forming a cool and impartial judgment, though another can easily see that his mind is powerfully swayed by a pre-existent wish to think favourably of the work.

This personal bias will naturally be apt to betray itself when the author criticized and the critic are one and the same person. In a general way, of course, society does not allow people to extol the work of their own hands. If a person attempts this too openly, either in conversation or in literature, he will be heartily ridiculed. Yet there are less patent and indirect ways of effecting this result. Thus a man may enlarge on the merits of some forthcoming volume to an admiring friend, and infect him with the puffing impulse. The friend understands what the aspiring author would like, and forthwith talks of the embryonic book at his club. Or, if he knows the editor of a leading Review, he writes betimes and asks for the book, so as to secure the early publication of a favourable notice. If he cannot do this, he will send a note to the gossip column of a journal to the effect that "Mr. So-and-so, whose occasional papers have already excited considerable interest, is about to publish a work on, &c." In all this the virtual puffer is the author himself, who gives the impulse and supplies the hint, trusting to his friend's faithfully carrying out his wishes. He manages, however, to escape the ridicule that usually visits the puffer of his own doings. Next to puffing our own production comes the puffing of one in which we have a joint interest. The most glaring illustration of this is the publisher's puff. The skill with which some publishers manage to select the tit-bit from the Reviews for the advertising column is something truly wonderful to the ordinary mind. The greatest triumph of this skill is seen in the extracting of something like a neat slice of praise out of a thoroughly adverse review by means of appropriate omissions. If, for example, the reviewer writes, "The author's stilted and bombastic language harmonizes admirably with his pretentious, but essentially feeble, ideas," the clever publisher has but to strike out the disrespectful adjectives and he has a presumably favourable opinion:—"The author's style harmonizes admirably with his ideas." If the vain author thinks he can just as well select these extracts for himself he is greatly in error. The experience of a publisher who studies this art enables him to

see possibilities that are lost to the untrained eye, and the author will serve his own interests best, in the matter of advertising at least, by leaving them in his publisher's hands. Nor is the publisher the only person besides the author who may have a direct interest in the success of a book. A less palpable stake is also possessed by other authors whose particular ideas are furthered by the new publication. Thus a writer on philosophy or art naturally welcomes the appearance of a new treatise carrying out the distinctive tenets of his school. If, as is very probable, he obtains the book for reviewing, he will certainly extol its force of argumentation or its subtlety of æsthetic insight, for in so doing he is virtually pushing his own ideas. This kind of puffing comes very naturally from a master to a young disciple who in the course of his maiden production pays his teacher a handsome tribute. The impulses of generosity here mingle with and disguise the very human inclination to admire the direct result of one's own instruction. And the praise can in this case be awarded with a more unstinting hand just because the relation of disciple to teacher excludes all thought of injurious rivalry.

Puffing, however, would be a restricted occupation if it had to depend on direct personal interest. A large part of the extravagant eulogizing to be seen in contemporary journalism is of a disinterested sort, perfectly free from any base reference to selfish gain. It is the generous pulsations of friendship that commonly underlie the practice. A man is not ridiculed if he cries up another out of pure affection; he is rather held to be a right sort of fellow, who is ready to do a friend a good turn. When it is distinctly seen that the puff springs from disinterested devotion, and is not due to any suggestions from the person puffed, it may be pretty extravagant without exciting ridicule. At the same time, since all puffing, as a species of extravagance, tends towards the borders of the ludicrous, and since enthusiasm is very apt to blind its subject to the comical aspects of his conduct, a good deal of care is necessary on the admirer's part in order to produce a thoroughly effective puff. Thus it should clearly have an element of reason or plausibility in it, and not run directly counter to people's common-sense. If, for example, a violent partisan insists on crying up some generally recognized inferior production of a writer as on a level with the best writings of its class, his attempt is pretty certain to miss fire, and the effect may be all the more ludicrous if there is reason to know that the author himself does not share in this extravagant estimate of his work.

Perhaps the point in which the zeal of the puffer is most likely to outrun his discretion is that of timeliness. The eagerness of enthusiasts is always apt to lead them into ill-timed utterances, and the warm admirer of a writer or artist often excites a gentle amusement by forcing in his eulogies at the wrong moment. Not long since an announcement appeared in the gossip column of a contemporary which, if, as it seems probable, it came from some zealous friend, is a striking example of this maladroitness. Here it is:—"Mrs. ———, a granddaughter of ——— ——— (a well-known author), died on the 30th ult. at ——, at the early age of twenty-five years. Mrs. —— was a writer of considerable promise, and had contributed stories to —— Magazine, the ——, &c. *Mr. —— —— is a young artist of some promise.*" [The italics are our own.] The way in which the notice is made to lead up to the point of real practical interest—namely, the accomplishments of the surviving widower—is extremely funny. It irresistibly recalls the thoroughly business-like epitaph said to be inscribed by a son to his deceased father, the landlord of a certain inn known as "The Lion." The writer first gives his readers the comforting fact that the worthy host had departed this life "in hopes of Zion"; after which he proceeds to recall them to mundane things by announcing that

> The son keeps on the business still,
> Resigned unto the Heavenly will.

There are pretty clear indications that the art of literary puffing is just now in process of development; and, if so, nobody can say into what it may ultimately grow. The special forces of our age appear to be highly favourable to this growth. The greater the competition for public recognition, the stronger the temptation to puff. Indeed, puffing is but another name for pushing, and this evidently tends to vary with the intensity of the struggle for existence. We see this plainly enough in the world of trade, where even "old-established" and "highly respectable" houses do not hesitate to puff their wares, and where advertising is rapidly growing into one of the fine arts. And the same thing is observable in that other world of literature and art in which men are pushing the productions of their brains. Men now make haste to be famous just as they have always been wont to make haste to be rich. Poems are announced and their high qualities extolled almost before the poet's manuscript is dry. Busy friends visit the studios to see what is being done for the approaching season, and hastily publish their "impressions" in the shape of an enthusiastic panegyric. Thus, owing to the eagerness of people to puff and be puffed, public judgment is forestalled and the future of a work settled for it, even before its birth, by confident sponsors.

That this puffing produces its effect is manifest in the very fact of its increase. One might suppose that the public ear would soon weary of this monotonous eulogizing, and see through this transparent artifice of forcing the market of ideas. But, in fact, the majority of men are wont now, as at other times, to take what is told them with a passive and credulous mind. If the "average reader" of a journal continually hears a contemporary poet described as a genius of the first magnitude, and knows nothing to the contrary, he naturally believes it. In spite of the too prevalent habits of lying and hypocrisy, confident and reiterated assertion generally commands at least a dull assent, and this the indefatigable puffer knows as well as anybody. Of course the reputation thus taken by storm is not necessarily a lasting one. In time there is heard the yet more commanding voice of the few who know, and then the puff is of no further use. But the puffer cares nothing for the verdict of posterity. He wants the thrilling sensation of a present acclamation; and if he can only succeed in setting a temporary fashion of opinion, he wins his object. While, however, this practice of premature puffing answers the needs of the indolent exceedingly well by supplying them with a ready opinion at the least cost of personal exertion, it constitutes a real nuisance to that overlooked minority who have a modest wish to form an opinion for themselves. Such is the force and continuity of the shower of puffs which now ushers in a new volume or picture by a name of repute that a man has hardly a chance of reserving his judgment. If he goes to his weekly paper, he finds that a puff is there, and if he takes up the morning paper, behold! it is there. Even if he ceases from reading altogether, he cannot escape from the voice of the puffer; for it is borne down on him at the dinner party, at his club, and even in his home circle.

The ethics of puffing is too large a subject to be dealt with here. To discuss it fully would involve a consideration of the whole duty of man in relation to the mature formation of uttered opinion. Without taking up too high a ground and condemning puffing *in toto* as intellectually dishonest, and while acknowledging the fact that the impulse is deeply rooted in human nature and connected with some of its best qualities, one may perhaps reasonably ask that some restraint should be set on the puffer's powers. This may be done in part by the editors of critical journals. It is related of an editor of a well-known paper that he made it a habit never to give a book to a reviewer whom he knew to be a personal friend of the author's; and there is no doubt something to be said in favour of such a rule. At the same time it is obvious that no editor is in a position to ascertain the fact of a personal relationship in every case. To this it may be added that the fact of "not knowing" a man often implies the presence of a distinct antipathy, and the editor has to avoid an injurious bias even more than a favourable one. Hence the duty of curbing the puffing impulse must fall in part on the critic himself, and if he is endowed with a fair amount of conscientiousness and an ample supply of good sense, he will easily manage to avoid gross over-statement. Indeed it may be affirmed that a man who is bent on being thoroughly honest can in most cases be safely left to review the work even of an intimate friend. The conscious intention to run up the particular book will be controlled by a higher purpose; and though the feeling of affection will certainly act as a slight bias giving a kindliness of tone to the critic's judgment, nobody would greatly object to this provided it did not absolutely blind him to the real quality of the writer's ideas. Of course a man's friend may write a book of which he is heartily ashamed, and about which he could hardly bring himself to utter his real opinion; but in that case he has the easy expedient of declining to review it at all.

The excesses of puffing in contemporary literature will only be effectually checked by some pressure from without. Such a pressure will certainly be brought to bear as soon as the reading public is less indolent and more enlightened. Yet it is difficult to see how this will be brought about within any discernible limits of time, since the reading section of society is continually recruiting itself by additions from below. It is the experienced eye that detects a puff; the tiro in literary matters is unsuspecting and full of reverence for the august plurality of the journalistic *ego*. One thing may perhaps be expected of the public even now, and that is that they should not allow themselves to be imposed on by a transparent device. When, for example, a paper inserts among its bits of news the announcement, "We understand that the article on —— in the new number of the —— Review is from the pen of Mr. ——— ———," the obvious intention is that people may suppose the article to be of some consequence, and one that is unusually being talked about. And if, as occasionally happens, this kind of announcement appears on the very day after the publication of the article, it does not need much penetration to see that the statement is misleading, and expresses rather a wish of the writer than a real fact. One may hope that the intelligence of the general reading public will soon make this kind of thing impossible.

For the rest, the opinion may be hazarded that one of the most effectual means of restraining the literary puff within decent limits would be a growing dislike to this species of well-meant service by the benefited party himself. If writers and artists loved truth better than praise, if they were more desirous of arriving at a just estimate of their permanent merits than of gaining immediate applause, the puffer's trade would soon be gone. But, after all, the great and the celebrated are only men, and share in the human weakness of taking pleasure in flattery, even when they vaguely recognize it as such. That the habit of puffing will be greatly curbed by the expression of a marked displeasure on the part of the persons puffed is too utopian a supposition. Better, surely, to trust to the growing intelligence of the public than to the growing distaste of authors for the sweets of flattery.

THE JADE OF OUR ARYAN FATHERS.

THERE is a good deal of significance in the discussion which has been caused by the discovery of some jade tools in Swiss lake-dwellings. That these tools should be at once recognized as the property of those well-known wanderers, the Aryan race, and that the Aryan race should be supposed to have carried the tools, as they carried their language, from their "cradle in Central Asia" to Switzerland, is a remarkable proof of the alacrity of science. The facts, as we gather them from a letter published by Professor Max Müller in the *Times* of last Thursday, and from other letters in the same journal, seem to be much as follows. Jade is a mineral which Europe does not produce, and implements of jade have been found in the lake-dwellings of Switzerland. As the mineral is not a European production, and as no one suspects the Aztecs or New Zealanders of having sold it to the lake-dwellers, its original source must be looked for in Asia. How, then, does the jade come from Asia to Switzerland? Professor Müller has been told, and the information makes him "feel a little giddy," "that the identical scraper was the property of one of the first discoverers of Europe." This is the singular conclusion to which some scientific person has bounded with alacrity. "It was chiefly in order to remove that feeling of giddiness," writes Professor Müller, "that I wished to call attention to another class of tools, equally ancient, possibly even more ancient, which were likewise brought into Europe from Asia by our earliest ancestors, and which we use every day without feeling the least surprise." Professor Müller alludes to the "Aryan dialects," and his argument seems to be that people who could bring a language with them from a distant home could also bring a jade scraper. And so, no doubt, they could; but there does not seem any necessity for supposing that the Aryans carried jade scrapers with them as well as parts of speech.

The *Times*, in a leading article, is naturally much more sure about the matter than Professor Müller. The mind of Professor Müller is slightly staggered by the idea that the scrapers are heir-looms of our Aryan ancestors; but the *Times* proves it to demonstration:—"By a species of exhaustive process of argument the mind is forced to one particular inference. Bretons of Brittany, Celts of Ireland, lake-dwellers under the shadow of Mont Blanc, must have conveyed with them their jade ornaments and utensils from the far-away home of themselves and jade in Central Asia, for the simple reason that they could have found the material nowhere in their own country." The reason is very simple indeed, rather too simple. Let us suppose that, four thousand years hence, a bit of Derbyshire pottery is found in a grave in Merv. A writer in the *Times* of the period will feel justified in saying that, by a species of exhaustive process of argument, the mind is forced to one particular inference. The people of Merv must have conveyed their crown Derby teacup from the far away home of themselves and crown Derby in central England, for the simple reason that they could have found the material for Derby ware nowhere in their own country. Then some sceptic of the future will ask whether the people of Merv might not have got the tea-cup by way of commerce. And that theory is not excluded, in the case of the jade tool in the lake-dwelling, by the "exhaustive process of argument" which forces the *Times* to the inference that the lake-dwellers brought the implement from Central Asia.

In anything like a scientific argument it would be necessary to know among what other deposits the jade scraper was found. Were there none but stone and bone relics in its neighbourhood, or were there weapons of bronze or of other metals? The Swiss lake-dwellings are of very different dates. Settlements like them still exist on the coast of New Guinea. Plenty of them survived in the time of Herodotus, who describes them. If a Sheffield knife is found in the lake-dwellings of New Guinea, we do not suppose that even the *Times* will urge that the islanders necessarily carried it to their new country from the ancient home of themselves and whittles in Sheffield. There is a simple explanation, which applies just as well to the jade implements in Switzerland. They reached Europe in the course of trade, just as the earlier bronze implements probably reached the lake-dwellers. There is no tin in Switzerland; bronze is found in many of the lacustrine homes, and bronze cannot exist without tin. Perhaps some enthusiasts will maintain that the tin was brought by a new wave of emigration from the east or west. On the other hand, if M. F. Lenormant is justified in saying that lake-dwellings continued to exist in Switzerland long after the foundation of Massilia and other Greek towns on the coast of southern Gaul, it seems quite as probable that bronze filtered through, from them to the lake-dwellers as that Sheffield knives reach New Guinea. In the same way the stone instruments, which are found in great numbers in the Isle of Elba are made of a silex which does not exist in the island. They probably were brought over by mariners to barter for some of the produce of Elba.

The antiquity and activity of commerce are facts which the theorists about the Aryan introduction of jade leave entirely out of sight. Why should jade have been brought into Europe by the first discoverers of Europe, when the prehistoric trade-routes are well marked and of unknown antiquity? Jade is precisely one of the curious exotic articles which would be in demand when a simple people came in contact with foreign merchantmen. Even in countries where the mineral is common, even among Aztecs and New Zealanders, it is fashioned into relics and held in a certain religious reverence. It is probably, of all stones, the best substitute for metal, and would be hardly less valued than metal when offered in barter. We believe that the whole theory of the introduction of jade by emigrants from Asia is founded on ignorance or forgetfulness of the existence of primæval overland commerce. Whence came the amber which is rudely worked into the necklaces which we find in the earliest Greek tombs? Were the necklaces brought into the Greek islands by Finnish or Scandinavian emigrants from the Baltic coasts? It is well known, on the other hand, that the Phœnicians got the amber from dealers at the mouths of the Eridanus or Po, and that these dealers were supplied by native merchants who crossed Germany by a mysterious route and who carried back into the North the produce of Greek and Etruscan industries. Another trade-route, from the Euxine sea along the feet of the Carpathians, across Silesia and Posen, to Pomerania and Jutland, is marked by the distribution of ancient Greek coins in the soil, much as the road of Hop o' my Thumb was marked by the white stones which he dropped as he went. It was from the trade of this route, according to some speculators, that bronze weapons reached the lake-dwellers of Switzerland. Meanwhile Phœnician commerce had its stations from the Spanish shores, where the savage natives worked mines with hammers of stone, to the Red Sea, and thence to the Indian Ocean. By the Phœnicians all the produce of different nations was distributed as freely as beads and the muskets called "park-palings" are scattered by our adventurers. There is nothing in a state of low civilization, nothing even in the savage state, to make commerce impossible. Articles of barter (women among others) are safely carried across the continent of Australia, through all the hostile or suspicious tribes, by a sort of commercial natives who have the privileges and immunities of mediæval heralds. In Africa, among races still more hostile, there is a constant ebb and flow of exchanges, and European articles filter into the most remote districts of the interior. Our conclusion is, therefore, that the presence of jade implements in the Swiss lake-dwellings is as easily explained as the presence of English beads in African villages where no Englishman has set foot. In the same way we would propose to account for the recent discovery of an Indian money-cowry in a barrow in Cornwall. The cowry came as the beads came, or as that mysterious object of unknown nature, an ostrich shell set in silver, reached the treasury of an early Scottish king. The worthy monarch's records describe the strange possession, but cannot account for its existence. It was chiefly valued because it was odd, and we may not irrationally believe that the money-cowry and the jade scrapers were prized by primitive collectors for much the same reason. If the lacustrine owner of the jade scraper did not know how to use it, as the *Times* supposes, that is only a stronger proof of the fact that he "picked it up" from a merchant's store as a curiosity. This seems rather more likely than the opposite hypothesis, that the Aryan ancestors of the lake-dweller had vapour baths and stone strigils, and that their degenerate descendant, while he kept the strigil, forgot the vapour baths.

Our explanation, we feel, is grossly prosaic. It reduces this wondrous jade to the level of the glass bead of commerce. The belief in the virtues of jade as an amulet is to be explained in the same way as the belief in the virtues of countless other fetish stones is explained. We lose sight of "the tempest-buffeted Aryan recovering from his swoon of bewilderment at the strange land on which his feet at length were resting." We have only to offer the sober picture of a lake-dweller, Aryan or not Aryan, swapping some of his produce for the curious smooth stone of some other capitalist. Of course it is impossible to prove that the Aryan (always more or less in a swoon, poor fellow), did not bring the jade, with his grammar and vocabulary, from no one knows where to Switzerland. But, on the whole, the more sober hypothesis seems quite as probable. We may admit with Professor Müller that the jade "originally came from well-defined areas in Asia"; but we see no reason at all to suppose that "it was the property of one of the first discoverers of Europe." Thus for the moment we escape the disagreeable "feeling of giddiness" which besets friends of the Aryan theory. That whole theory is based on the hypothesis that foreign materials could only be introduced to Europe by the first discoverers of Europe.

THE ROMAN BREVIARY.

CARDINAL NEWMAN speaks in his *Apologia* of the Roman Breviary as "that most wonderful and most attractive monument of the devotion of saints," and explains how an apparent accident at first introduced him to the knowledge of it. His praise is not undeserved, but the Breviary has an historical and ecclesiastical, not to say literary, which to many will transcend its purely devotional interest, the more so as being the chief source from which the Church Service in the English Prayer-book is derived. By the Church Service we mean the "Matins" and "Evensong," for there is no one volume comprising the Latin originals of the various offices comprehended in the Book of Common Prayer. The Communion Service is represented by the Missal, containing not only the "Ordinary of the Mass," but the Collects, Epistles, and Gospels, and other variable portions of the altar service; while the Occasional Offices—for administration of Sacraments, Churching, Burial, and the like—are found in the Roman Ritual. But with the *Missale* and *Rituale Romanum* we are not now concerned, and the Breviary alone will supply more than ample matter for consideration within our present limits.

Considering the interest of many kinds which it must possess for the scholar and the student, it is curious that no complete translation should ever have appeared till within the last few months. It formed the subject of one of the earliest Tracts for the Times, from Mr. Newman's pen, and he tells us that several years afterwards some younger men contemplated translating the four volumes *in extenso*—it is usually divided into four volumes according to the seasons of the Christian year—but were dissuaded by advice to which they felt bound to defer. The task has now been accomplished as a labour of love by the Marquess of Bute, and there can be no doubt that many will be grateful to him besides those for whose special benefit, as we gather from his brief and modest preface, he has undertaken it, though we are not equally sure, for reasons that will appear in the sequel, how far the authorities of his own Church, who do not seem to have been consulted on the matter, will be among them. But here a word of explanation is required. It may be thought strange that the ordinary services of their Church should not long since have been made accessible in a vernacular form, for practical purposes, to the great body of Roman Catholic worshippers, whether in this or other countries; for we suspect Lord Bute's is the first translation of the Breviary which has appeared in any language of modern Europe. But the fact is that the Breviary offices, though strictly imposed on the clergy, no longer constitute any part of the ordinary worship of the Church. The Mass is the only obligatory Service, and the only one ordinarily solemnized in the morning in parish churches; and for this abundant aids, in the shape of translations and popular manuals, are provided. In some places it is usual for Vespers or Complin, or both of them, to be sung on Sunday afternoons, and where, as in France, the similarity of language makes it comparatively easy to follow the words and meaning of the Latin psalms, which seldom vary, the whole congregation may often be heard joining heartily in the chant. But in England and Germany *e.g.* this would be impossible, and Vespers are either superseded by informal vernacular services or entirely subordinated to what is called in Belgium the *Salut*, or rite of Benediction. As for the rest of the Breviary offices, they are never heard at all, as a rule, except in conventual and, to some extent, in cathedral churches, where, however, none but those immediately concerned, the monks or canons, take any part in them. It was not indeed always so, for in the middle ages even the long Matin service was often celebrated in public churches, and seems to have attracted worshippers, though it is not easy to see how they can have derived much benefit from it. At the Council of Trent the French Bishops endeavoured to procure a decree commanding attendance, under pain of mortal sin, at Vespers as well as Mass on Sundays and other "days of obligation"—of which last there are about eight now in force in England—but it was wisely refused. The Breviary then, holding in this respect a very different position from the English Prayer-book, is scarcely more familiar, except by name, to the great body of Roman Catholic laymen than to Protestants. Lord Bute hopes his translation may prove acceptable, especially to Anglican converts, who miss the daily offices to which they were previously accustomed. We have heard certainly of one or two churches where an English Complin service introduced by a convert had become very popular, until an Ultramontane bishop succeeded to the titular see, and scattered the congregation by suppressing it. But it is time to say something of the history, structure, and intended use of the Breviary.

It must be remembered in the first place that the Roman Breviary, as finally settled by a Bull of Pius V. in 1568, does not stand alone. It is one of a vast family of similar office books which once overspread the Western Church—for of the East we have no room to speak here—and some few of which still survive. In England alone there were not only the "Uses" of Sarum, York, Hereford, Bangor, and Lincoln—noticed in the Preface to the Prayer-book—but others also. In France nearly every diocese had its own use, many of which have been swept away under the late pontificate mainly through the misdirected zeal of the Ultramontane Dom Guéranger, who made the introduction of a dead level of Roman uniformity the object of his life. The beautiful Paris Breviary, of which we may have a word to say presently, survived in spite of the jealous antagonism of Rome till the other day, when Pius IX. managed to bury it in the grave of the murdered Archbishop Darboy. The Ambrosian rite, both Missal and Breviary, containing many visible peculiarities which could hardly fail to strike the eye of even a casual observer, has been vigorously defended by successive archbishops against successive popes, and still holds its place throughout the diocese and province of Milan. At the Duomo of Milan the Roman Mass is only allowed to be said in the crypt. And besides these and other local uses, now or formerly prevalent, great religious orders—like the Dominicans and Franciscans—had Breviaries of their own. Nor is the origin of this diversity hard to trace. In the early Church there was no fixed form of service except for the Eucharist, which was alone held to be of universal obligation. The congregational, or what came afterwards to be called the Choir service, varied in detail in different places, though modelled on a common type, and was left very much to the discretion of each bishop. Meanwhile the rise of the monastic orders brought with it the need of a fuller and more systematized method of daily devotion, and the very form and name of the Breviary Hours mark their original purpose. Matins consists of one or more "Nocturns"—one on "ferial" or week days, three on Sundays and festivals—intended to be said during the night. Lauds, the first of the seven Day Hours, followed at early dawn, and then came Prime at 6 A.M., Terce, Sext, and Nones, belonged respectively to the third, sixth, and ninth hour (9, 12, and 6 o'clock) and then came Vespers at six P.M. or at sunset, followed at 9 o'clock by Complin (*Completorium*) the closing and completion of the whole order of daily prayer. It is obvious that such an arrangement can only be carried out in its integrity in a religious community, whose time is at their own command, and who make the public offices of religion a main part of their daily occupation. And accordingly the Breviary offices were allowed elsewhere, in cathedral or parochial churches, to be said by anticipation or accumulation; *ie.* Matins and Lauds were said overnight, as is still permitted either in public or private use, at any hour of the preceding afternoon or evening nearer sunset than midday, while the "Little Hours," from Prime to Nones, were said together before or after the morning mass, and Vespers and Complin at any time after midday. From this it was not a very long step to abandon the public recitation of the Hours altogether—especially as the growing demand for vernacular services suggested the introduction of simpler and more popular substitutes—and thus to relegate the Breviary to the private use of the clergy, on whom it is still strictly enforced, but with the relaxations already referred to, that Matins and Lauds may be said overnight, and that the whole daily office or any portion of it may be said at any time between morning and midnight, except that Vespers and Complin must not ordinarily come before noon. Nor is any restriction of place or posture imposed on the private recitation of the office, which may be said in a railway or a steamboat as well as in church. Our readers may recollect that this obligation is formally retained, though it may not be very generally acted upon, in the rubrics of the English Prayer-book directing that "all priests and deacons are to say daily the Morning and Evening Prayer, *either privately* or openly, not being let by sickness, or some other urgent cause." It is recorded in the Life of Bishop Wilberforce that he suffered no stress of engagements to interfere with the observance of this rule, and often said the Evening Service—as Roman priests may be seen reciting their office—in a cab. The private recitation of the Breviary office would occupy, according to its length and the slowness or rapidity of utterance, from half an hour to an hour daily.

It may help our readers to understand better the structure of the Breviary, if we begin by again reminding them that the English Morning and Evening Prayer are based upon it, though of course with considerable modifications and omissions. Speaking roughly, Morning Prayer is a compilation from Matins, Lauds, and Prime, and Evening Prayer from Vespers and Complin, "the Little Hours"—Terce, Sext, and Nones—being dropped out altogether. But whereas the whole Psalter is supposed to be gone through every week in the Roman office, in the shorter English office it is spread over a month; from the latter also have disappeared the hymns, responsories, and "antiphons"—or verses prefixed to every psalm and canticle and intended to strike its keynote—and the lessons are taken exclusively from Scripture. We have said that the Psalter is supposed to be gone through once a week; and so it would be in a week composed of Sunday and six "ferial" days—like most in the Anglican Calendar—but in fact no such week ever occurs. Nine-tenths of the days in the year are festivals of some kind or other, when the festal supersedes the ordinary office; and hence, while certain psalms, common to all or nearly all festivals, are constantly repeated, others are seldom, if ever, used at all. Another inconvenience of these numerous feast days—some movable, some fixed—is found in their frequent clashing or "concurrence" with one another, whence arises the necessity for an elaborate classification of "doubles," "semi-doubles," &c. and a minute code of rules as to the "translation" of a festival to another day (sometimes a month or two months distant) or the "commemoration" of a Sunday or minor festival falling on a greater one. It is to these intricate directions that the pathetic complaint of the Reformers of "the number and hardness of the rules called the Pie" (*Pica*) refers, and if the clerics of that day had to hunt out for themselves the proper office for each day by a laborious study of the *Rubricæ Generales*, we can well believe that "many times there was more business to find out what should be read than to read it when it was found out." Their modern successors, fortunately for themselves, are spared so excruciating a trial by the annual issue of an authorized *Ordo Recitandi Officii Divini*, which specifies the precise office to be used on each day in the ensuing year with its various translations, commemorations, concurrences and the like. Meanwhile the Psalter may be said, as in the English Prayer-book, to form the essence and backbone of the whole Breviary service. Matins included, besides the *Venite* at the commencement and *Te Deum* at the end, eighteen Psalms on Sunday—twelve in the first and three in the second and third nocturns—on festivals three psalms in each nocturn, and on ferial days, which have no division of nocturns, twelve psalms. At Lauds and Vespers there are five psalms or groups of psalms, varying on ferial or week-days, but generally the same on all festivals, besides the *Benedictus* or *Magnificat* at the close, designed to commemorate the Incarnation. The 118th (in the English Prayer-book 119th) Psalm is distributed in portions over the four Little Hours daily throughout the year, and the four Complin psalms also never change. In the same way the hymns for Matins, Lauds, and Vespers vary according to the festival, season, or day of the week, while those for the Little Hours and Complin are always the same. Many of these hymns are very beautiful, and have become widely popular in an English dress, but those in the suppressed Paris Breviary are on the whole

superior to them. The Latin text of both sets was published at Oxford in the early days of the Tractarian movement under Mr. Newman's editorship, and graceful translations of most of them appeared partly from his pen and partly from that of the late Mr. Isaac Williams. The Antiphons and lections—or lessons as we should say—of the Paris Breviary differ also considerably from those of the Roman, and generally differ for the better. These lessons belong to the Matin Service, for these are only short *capitula* of a verse or two, varying with the day or season, in the Day Hours. In the ferial Matins there are only three lessons, which are always taken from Scripture, but in the Sunday or festal office (which is really the ordinary one) there are nine lessons, three in the first nocturn taken from Scripture, three in the second nocturn from the Fathers, or (more generally) from the Lives of Saints, three in the third nocturn—which always form a commentary, usually taken from some early Father, on the Gospel of the day.

It may be inferred that the lessons of the second nocturn—in spite of several former revisions—present the most vulnerable point in the Breviary Service, and there can be little doubt that if it had been in general use in the vernacular, many of these "uncertain stories and legends," as they are designated in the Preface to the Prayerbook, would long since have inevitably disappeared. Lord Bute suggests that some of them "would probably receive considerable modification at any future revision," and we may not improbably surmise that one of his leading motives for submitting them for the first time to public criticism in an English dress, not without occasional annotations, is to promote such a revision. To give but one characteristic instance—he observes that "the extraordinary history (?) of Marcellinus (in the office for April 26) is now universally, or almost universally, acknowledged to be a fiction." He does not add that it was a deliberate fiction and has been deliberately retained. The apocryphal and not very edifying legend that Pope Marcellinus apostatized in the persecutions of Diocletian and "offered incense to the images of the gods" is studiously preserved for the sake of its equally apocryphal and absurdly unhistorical supplement that a Council of 300 Bishops at Sinuessa refused to pass sentence on his apostasy "because the first See is judged of no man." The late Father Gratry called attention to some equally "extraordinary" falsifications of which there are numerous instances in lessons of the Roman Breviary, besides many exploded fictions which are simply childish, and some wholly fictitious saints. The Paris Breviary, which was revised about the middle of the last century and became the model of many other diocesan "uses" in France, was carefully weeded of these foolish or fraudulent accretions, and hence fell under the vague and convenient imputation of "Jansenism," to which it has at length succumbed. Lord Bute has done good service in another way, which may be hardly more pleasing to his ecclesiastical superiors. He has translated the psalms, lessons, and collects for himself from the Latin—not unfrequently in the words of the English Bible and Prayerbook—instead of adopting the wretched compound of the Douay version and the ordinary Roman manuals; partly, as he observes, not without a pardonable touch of latent sarcasm, because these versions are often unintelligible without a reference to the original text. He has, on the whole, succeeded well in his endeavour "to give a rendering in good, plain, manly and idiomatic English," and his translations of the hymns, which are mostly those of Cardinal Newman or of Dr. Neale and other Anglican writers, are judiciously selected, though it is needless to say that Ultramontane organs have already detected heresy in them. One effect which he anticipates from his translation is that it may help to soften certain prejudices of Protestants, and here too we are disposed to agree with him. To Anglicans who were not acquainted with the Latin Breviary it cannot but be interesting to discover how much after all the formularies of the two Churches have in common, and how largely the structure and contents of the English Prayerbook are derived from the offices in use before the Reformation. And to Protestants generally it ought to be satisfactory to find how comparatively little there is, in spite of incidental blemishes such as those noticed just now, which they can regard as superstitious or ungodly in the daily manual of devotion of the whole Roman Catholic priesthood, nine-tenths of which at least is in the actual words of Scripture. To Roman Catholics themselves it must, one would think, suggest a feeling of regret—which is all but openly avowed by the translator—that so magnificent a treasury of devotion should be to the great mass even of the devoutest among the laity a sealed book. If, in symbolical and dramatic effect, the English Prayerbook may be considered inferior to the Breviary, yet the one, precisely because it is English—to use a famous phrase of Luther's—is "a living thing that hath hands and feet," while the other, as long as it is kept jealously enshrined "in a tongue not understanded of the people," must remain for them an unknown or unmeaning form.

COUNTRY BANKS.

WHEN a country gentleman goes to his nearest town, a visit to his bank generally constitutes part of his business. Independently of any direct banking transaction, he may often obtain information gratis at his bank which he would otherwise be obliged to purchase for at least six shillings and eightpence at his lawyer's. On the other hand, a clever lawyer will often do banker's work, when consulted by his clients, and pocket banker's commission in addition to his fees for advice. Indeed the country banker is apt to look upon the country lawyer, in a commercial sense, as more or less of a poacher. We are not now speaking of joint-stock banks, as these in small towns are usually mere branches of large banking establishments in cities. We have in view rather old-fashioned country banks of long standing, whose names are household words in their own towns and neighbourhoods. The highly flavoured and greasy notes of these little establishments are more valued in their surrounding districts than those of the Bank of England itself, and the firms themselves are spoken of in their own towns as "*the* bank," in contradistinction to all other banks. Materially speaking, these old banks are, in most instances, anything but palatial. Their very shabbiness is, as it were, a standing protest against the extravagant splendour of modern joint-stock banks with their Elizabethan gables or Palladian façades. In the interior of these most conservative places of business there is a peculiar stuffiness which is completely opposed to all newfangled notions about ventilation and hygienic principles. If the depositors were to miss the well-known fustiness of the building, they might become nervous about the safety of their money. The walls have not been papered for twenty years; there are cracks of great antiquity in the ceiling; and the grate is of a pattern which would never be tolerated in any modern dwelling-house. The general appearance of the counting-house is about on a par with that of a third-class London shop. The only thing in the place which is made to keep pace with the times is the strong-room, with its thief-proof and fire-proof safe. Even this is not visible to the public, or there is no saying whether some of the old-fashioned depositors might not suspect the partners of adopting a dangerous innovation on their ancient system. Wonderful relics of defence are preserved in the building at the back of the counting-house. There is a brass-barrelled blunderbuss with a flint and steel lock; there is an alarm bell, a rattle, and a man-trap, which used to be laid every night in the little garden at the back of the house.

Where the partners are elderly, they are quite in keeping with the building and its appointments. They are Tories of the Tories. They are among the select few who still drink port after dinner. They feed freely on early salmon, venison, strong Stilton cheese, and sucking-pig. They dine at six, and have little suppers of toasted cheese or lobsters at half past ten. They encourage beggars and take snuff, and they suffer much from the gout. They take in *Blackwood's Magazine* and the *Quarterly Review*, and they never have subscribed and never will subscribe to a circulating library. The younger generation of country bankers is quite different. A sharp young partner has many opportunities of attaining to popularity. When a public hall or a hospital is wanted, he collects subscriptions, and it is he who gets up the county balls. On boards and committees he is an important personage, for, living on the spot, he has far more opportunities of ascertaining facts connected with the business of the meetings than country gentlemen who only visit the town occasionally, and his business habits enable him to make himself practically useful where others are disinclined to exert themselves. When there is an election, although it would not do for him to take a very prominent part in the canvass, he exerts considerable influence in a quiet way, and he has many opportunities of gaining valuable information for his party. He hears when properties are likely to come into the market, and gives hints accordingly to those whom he considers it desirable to serve. In his comfortable rooms there is always luncheon for his country friends, and ladies who come to the little town to shop in an afternoon find excellent tea and the latest news in his well-furnished drawing-room. Very different from his bank is the dwelling-house of the young or middle-aged partner. The house itself is small, but it has more comforts than many large mansions. The sitting-rooms are almost too full of richly-carved old oak, and in the cabinets there is a profusion of rare china. Most of these treasures have been purchased in the neighbourhood, for the banker knows of sales which few other rich people hear or think of. He is as great a collector of gossip as of curiosities; and, chatting pleasantly with every one who comes into the bank, he has admirable opportunities of indulging his taste. The parson is completely at his mercy. If the church requires restoration, it would be useless to attempt it unless the banker will co-operate in the undertaking; but, if he will only take the matter up, it will prosper in no time. If the rector wants to put candlesticks or a brass cross upon the altar, there will not be much opposition if the banker will countenance the proceeding; but, if he is not inclined to back up his spiritual director in the affair, the cross and candlesticks will lead to nothing but ignominy and confusion. The curates are at his beck and call, and their social happiness or the contrary is much in his hands.

The principal clerk at a country bank is an important member of the establishment. He and the wart on the side of his nose have been known to most of the inhabitants of the neighbourhood under forty years of age since the days of their childhood. He loves a close atmosphere, and complains of cold if any attempt is made to open a window or a ventilator. The slightest noise in the usually quiet street worries him, but he enjoys the clatter of sovereigns as if it were the sweetest music. He is very particular about his ledgers, which he loves even better than his children, and when the process known to bankers as "calling over" is

under progress, and his entries are being "ticked" by others, he is as miserable and as restless as a cow whose calf has been taken from her. His favourite literature is the short paragraph which fills up the spare space at the bottoms of newspaper columns, and his fellow-labourers in the duties of banking assure us that he has an extraordinary predilection for onions. The three things that he hates most are a Radical, a Dissenter, and a draught. The younger generation of clerks in country banks consist of men who are something between National schoolmasters and drapers' "assistants." They are civil and obliging, and they are deservedly popular. In small banks clerks must necessarily know a good deal of the condition of the firm and its business, as well as of the financial position of the people in the neighbourhood. It is obvious, therefore, that to secure a good clerk is as important to a country banker as it often is difficult.

We have thus far been looking at country banks from behind the counter. There is, however, another point of view. Partners and clerks could tell us that the most important and characteristic aspect is from the other side of the counter. The letters have scarcely been opened in the morning before one or two depositors drop in. First come some of the local tradesmen. The maltster, the tanner, and the miller are among the principal of these. They generally keep good balances, but they occasionally require overdrafts. A considerable profit is made by the country banker in discounting the trade bills of this fraternity. This is a very safe kind of business, as these bills are as different as possible from the accommodation bills of evil repute. A tradesman of this class has an unqualified veneration for a banker, and generally calls early in order to ask his advice upon some question of trade or credit. The haberdasher and small shopkeeper come in with their deposits, which commonly consist of what a banker regards as small change. Then the farmers begin to appear, expending their caloric freely, and unbuttoning their clothes in an alarming manner in the search for their money-bags. They seem to wear numberless waistcoats, and to have pockets where an ordinary person would least expect to find them. They produce rolls of local banknotes of such age and bouquet as to make even the heart of the hardened cashier to shudder. Finally, they fish up large handfuls of greasy coppers out of trouser pockets of fathomless depth. As an occasional variety, "the widow of a tallow-chandler, who is carrying on the business in his name" (as she describes herself), appears upon the scene. After depositing a basket, an unclean pocket-handkerchief, and an umbrella upon the counter, she spends several minutes in dragging off some wonderful gloves which seem to combine all the inconveniences of tightness and slackness. She then fumbles in what she calls her "ridicule" until she finds a cheque, for which she requires immediate cash. It takes ten minutes to make her understand that this document is absolutely inoperative until endorsed by the person to whose order it is made payable, and all she knows of this person is that he lives "somewhere on the other side of Manchester." Now and then a couple of men come in together with a hangdog look, and dragging their apparently unwilling legs behind them. If any one else is in the bank, they wait together in a corner until the coast is clear, when they come and lean upon the counter, and one of them, after a pause, says, "This here man wants to borrow fifty pounds." Some gentlemen feel a delicacy in coming themselves to ask for loans, and send their wives upon such missions. These ladies occasionally bring propitiatory offerings. We remember seeing a fat farmer's wife come into a bank, open a large basket, and, throwing a hard-shot and gory hare upon the counter, exclaim, "I've brought a 'har,' and we want to borrow twenty pound." A banker has admirable opportunities of making observations upon the varieties of facial expression by contrasting the countenances of those who come to him to deposit with the countenances of those who come to borrow. There is a class of customers of whom the banker has a strong abhorrence—those who come neither to lend nor to borrow, but only to change money. This simply gives trouble without profit. We remember a banker complaining to us that a small shopkeeper had given his name as a reference of five years' standing, when the only transactions the man had ever had at the bank had been to ask for gold and notes in exchange for coppers and silver once a week. In the course of the day several country gentlemen generally drop in. Their principal banking business is transacted by cheques; and, although they do now and then come for some ready money, their visits are most frequently made with the object of hearing a little gossip or enjoying a little chaff. Too often the banker becomes the helpless victim of a bore. When this creature comes to prey upon him there is literally no escape. We remember seeing a clerical bore metaphorically devouring a good-natured country banker whose patience was evidently sorely tried. At last the clergyman said to him, "By the way, I forget whether you are High Church or Low Church." "Sir," was the reply, "I am a banker." The divine took up his umbrella and decamped.

One great advantage of country banking as a profession is that business is over at a comparatively early hour in the afternoon. When men engaged in other occupations have still a couple of hours' work before them, the banker's duties are at an end while there is yet time to enjoy a walk, a ride, or even a stroll with a gun through the turnips.

A DRAMATIC BALL.

THERE is too much reason to fear that the actors of our time are an ungrateful race. The many and earnest efforts made on their behalf are allowed to pass almost unheeded, and even the occasional intervention of a bishop fails to move their hardened hearts. The daring curates who lately formed themselves into a Church and Stage Guild have only succeeded in winning the co-operation of a few impulsive ballet-girls; nor is the disappointment that comes of wasted benevolence confined merely to those who strive to secure the moral elevation of the theatre. The efforts of other and less ambitious spirits who seek only to minister to the enjoyment of actors lie equally open to misconstruction, and the fate of Mr. Hodgson Stanley may serve to warn all such rash philanthropists that they must not look for gratitude if they devote themselves to the interests of the stage. Mr. Hodgson Stanley has lately laid his sorrows before the world. As the prosecutor of an indictment for libel against the *Era* newspaper, he has enjoyed exceptional facilities for making known the facts of his own romantic career, and exposing the heartless conduct of the class in whose interests he had laboured. In early life he appears to have filled the humble position of a solicitor's clerk, and at that time he was content with the modest title of Hodgson. But, having joined the ranks of the dramatic profession, he straightway took the added dignity of Stanley, and as Mr. Hodgson Stanley he has since been known to fame. He would seem, from his own account, to possess a rich and varied knowledge of several distinct branches of his calling; and it was, we suppose, out of a feeling of respect for his very versatile gifts that he came at last to be marked out as the fittest person to organize a ball in honour of the drama. At any rate we have it in evidence that, "at the request of numerous friends of the dramatic profession," he generously undertook this irksome and disinterested duty, and that he proceeded at once to engage rooms at the Cannon Street Hotel for the accommodation of his numerous and distinguished guests. The measures which Mr. Stanley adopted in order to carry out his benevolent intention prove him to have been actuated by no mean spirit of exclusiveness. A little while ago a masque ball was advertised to take place in a certain part of London, but the advertisement contained a vexatious restriction to the effect that "clowns and Zulus" would not be admitted. Mr. Stanley, it must be confessed, displayed a far more liberal conception of the proper limits of hospitality. Having made a sufficient concession to aristocratic prejudice by engaging the band of the Orleans Club, he sought to place his entertainment upon a comprehensive basis. With this view he put himself in communication with the waiters at Evans's Supper Rooms, and with the hall-porter at the Naval and Military Club. This hall-porter would seem to be a person of considerable influence and position, for it was confidently anticipated by Mr. Stanley that his exertions would be the means of bringing to the ball the members of the Club, and the ladies of their respective families. If he was partly disappointed in this hope, the explanation may perhaps be sought in the fact that a commission of ten per cent. on the sale of the tickets was too trifling a reward to induce such a powerful personage to exert all his influence with his friends. We were not aware, indeed, that it was customary for officers in Her Majesty's service to seek admission into society through the friendly offices of a hall-porter; but, as Mr. Stanley has organized other entertainments of the kind, we may assume that he is thoroughly conversant with the ways of the world. But besides the friends of the drama secured by the waiters at Evans's and the porter at the Naval and Military Club, a number of enthusiastic patrons of the stage were admitted by payment at the doors, and invitations were freely distributed among the actors and actresses of Mr. Stanley's large and varied acquaintance.

After taking all this trouble, it must have been a cruel blow to the generous host to find that his efforts remained unappreciated by the very class he had sought to honour. The "friends of the drama" came in their hundreds, and their unimpeachable social standing is vouched for by the manager of the Canterbury Music Hall and by a pensioned inspector of police. Almost the only friends of the drama who were not present were the actors and actresses for whom the entertainment had been specially devised, and not even the attraction of a four-and-sixpenny supper sufficed to insure their co-operation. Nor was it merely in this negative way that Mr. Stanley felt himself to have been slighted, for in the very next issue of the *Era*, the recognized organ of the dramatic profession, the whole undertaking was denounced as an insult to the stage, and as a disgrace to those in whose name and for whose delight it had been got up. Smarting under the effects of this wanton display of ingratitude, Mr. Stanley forthwith sought the protection of the law. The editor of the *Era* was brought before a magistrate on the charge of having published "a false and defamatory libel," and by a recent decision of the judges he was precluded from entering upon any defence or explanation of his conduct. Mr. Stanley thus enjoyed the satisfaction of seeing his tormentor committed for trial at the Central Criminal Court, and we owe to this fact the instructive account of Mr. Stanley's past life and present occupation which has now been made public. But with his arrival at the Central Criminal Court Mr. Stanley's triumphant career may be said to have terminated, for as soon as the defendant was allowed to state his case and call his witnesses, the jury expressed themselves satisfied of his innocence, and Mr. Stanley now retreats into well-earned obscu-

rity a sadder, and we trust a wiser, man. He will scarcely be disposed for a long time to come to associate himself with any more philanthropic undertakings for the benefit of a thankless and ungrateful profession. Actors and actresses seem neither to desire nor to deserve his hospitality, and Mr. Irving and Mr. Warner, who were called for the defence, agreed in thinking that the article complained of was not half severe enough. It is evident, therefore, that he will henceforth have to seek some other sphere of usefulness, and it is doubtful after such testimony as this whether even "clowns and Zulus" would consent to accept his invitations for a dance. A gentleman, however, who can rely upon the assistance of such powerful friends as the hall-porter at a military Club and the waiters at Evans's is not likely to suffer very deeply from the adverse verdict of a British jury. The young gentlemen of fashion who at the bidding of those authorized stewards could be persuaded to believe that they were about to make the acquaintance of leading actors and actresses are no doubt easily contented, and they would probably be just as well pleased if Mr. Stanley were to organize an entertainment in honour of potmen and prize barmaids.

But the result of this case, although it will not greatly injure Mr. Stanley, cannot fail to bring discredit upon an important section of English law. If the decisions which at present govern the conduct of criminal prosecutions for libel are to be permanently maintained, the power and usefulness of the press must be very seriously curtailed. It is somewhat unfortunate that it should be necessary to urge this point just now, for it is notorious that a certain class of journals have shown a tendency to strain beyond endurance the privileges accorded to them, and have indulged in a kind of personality which the respectable portion of the public is rightly anxious to check. In the face of such a scandal, it may perhaps be difficult to prove that the representatives of the press do not already enjoy all the facilities of criticism to which they are justly entitled. And yet the case under consideration points clearly to this conclusion. The machinery of the law must be even more clumsy than is popularly supposed if some better means than the present cannot be devised for protecting the interests of the public without unduly fettering the powers of those who are entrusted with the duty of public criticism. As the Recorder in his charge to the jury took occasion to point out, one of the most useful functions of the press is to take under review various matters concerning the social life of the nation which are not susceptible of any other kind of control, and in the discharge of this function it may often be necessary to write in a manner that can be construed as libellous. But, unless some important alteration of the existing law can be effected, the exercise of such a duty bids fair to become increasingly irksome and burdensome. In the present case, for example, the editor of the *Era* has been enabled to vindicate his conduct, and to prove beyond dispute that the comments which he published were both just and necessary; but he has done so only at the cost of very serious personal inconvenience and a large expenditure of time and money. And the annoyance he has suffered may be inflicted upon any public writer at the instance of a prosecutor of the most worthless character, who can rely merely upon the *primâ facie* evidence of libel. The meanest impostor whose tricks are exposed in the press can, by the aid of the law, enjoy the satisfaction of seeing the writer who has unmasked him committed for trial. He can drag his assailant before a magistrate, who is bound to exclude even the simplest explanation of the criticism complained of, and for weeks the public may be left under the impression that an innocent person has been foully slandered. In these circumstances it is surely not unreasonable to demand either that the preliminary inquiry shall be abolished altogether, or that it shall be reorganized in a manner consistent with justice and common sense. In regard to nearly every other form of offence the magistrate has the power to examine and dismiss a frivolous and groundless charge, and there would seem to be no sufficient reason why this power should be withheld in the one class of cases where it could be most usefully exercised.

WAR CORRESPONDENTS.

It is not improbable that the position of War Correspondents may be one of the many subjects which will be brought before Parliament during the coming Session. There was—owing perhaps to the fact that editors were not sorry to avoid the enormous expense of long telegrams from India—less outcry about the regulations of the Indian Government than might have been expected; but there can be no doubt that they have caused the most bitter irritation amongst a set of men who certainly do not underrate the value of the services they render the community, and who are very strongly of opinion that the world generally, and the official world especially, ought to concur in the high estimate they have formed of themselves. Although the Indian Government has—somewhat clumsily it must be admitted—intimated that the rules respecting Special Correspondents are to remain in abeyance, it is not to be expected that those diffident gentlemen will be content to pass over silently the slight to their calling which has been inflicted by the Calcutta officials. The public, it is true, has shown the most heartrending indifference in the matter, and there has been no sign whatever of regret for the temporary extinction of the War Correspondent; but that makes it all the more important that the grievances of the pen-men should be dwelt upon with eloquence. It would never do to acquiesce in the general apathy. A protest must certainly be made, and the attention of Parliament must be called to high-handed wrong. It may be taken for granted that a great deal will be heard about the scandalous iniquity of the Indian Government's regulations, and that, stimulated by indignant scribes, deserving members of Parliament, who will speak with the happy certainty of being well reported, will declaim against the obnoxious rules which may still be said to hang over the head of enterprising writers.

Already the first note of attack has been sounded by the most distinguished of War Correspondents. In the pages of the *Nineteenth Century* Mr. Archibald Forbes has spoken for his brethren, and has attacked, in no measured language, the conduct of the Indian authorities. Very angry indeed is he with them, and, being a man accustomed to speak his mind plainly, he talks of those who have offended him in a manner which seems striking even in these days of vigorous controversy. Lord Lytton and his subordinates have, he says, issued a code of regulations which, "whether intentionally or not, has the effect of prohibiting from accompanying an army in the field every war correspondent who possesses a tittle of that sense of self-respect which must have deserted alike those who drew it up, those who promulgated and acted on it, and those who, in dogged, sullen shamefacedness, decline to own and to commit infanticide on the scandalous bantling which has been sworn upon them." These be brave words, certainly, and wroth in good earnest must Mr. Forbes have been when he used them. The singular figure of speech in which he has indulged is perhaps open to criticism; but it would be petty to carp at the expressions of a man who is so wrought upon by the edict to which he objects as to look upon it apparently in the light of a personal affront. In the paragraph preceding that from which we have quoted, Mr. Forbes speaks of himself as "thrilling indignantly with a sense of insult that is almost brutal." Other portions of his article give, in a different manner, equally strong evidence of an indignation which has altogether perturbed judgment. In speaking, for instance, of the War Correspondent's calling, he gives the following modest estimate of it. "Is this craft of ours," he says, "not less noble than that of the clergyman himself, not less patriotic than that of him who gladly dies for his country, not less tender than that of the poet, in that our theme throbs and glows, and dares and dies, under our very hand, not less reciprocative to the beating heart of a nation than is the devotion of a sister of mercy in the field-hospital, to be stamped out on the pretext of a narrow utilitarianism that is as fictitious as it is short-sighted?" How strangely must an admirable writer have been carried away by wrath when he could pen such nonsense as this.

It must not be supposed, however, that because Mr. Forbes's article is marked by great extravagance, it is, as a whole, unworthy of consideration. He is not a man to treat any subject, and least of all such a subject as this, without saying something that well deserves attention; and in the present case he certainly commands it when he ceases to rave against officials and discusses in detail the objections which may be raised to the presence of War Correspondents in the field. These, shortly summed up by him, are as follows:—"1. That they [the Correspondents] may detrimentally affect public opinion at home by unpleasant and inopportune truth-telling, or by wanton lying. 2. That they may produce discontent and want of confidence in an army in the field by hostile criticisms on its leader. 3. That they may give information to the enemy by revealing prematurely intentions and combinations, or by forwarding for publication details of strengths, fortifications, means of or shortcomings in transport, supplies, &c., of which the enemy may take advantage." The first of these objections Mr. Forbes disposes of somewhat briefly; and indeed, as stated by him, it has not very great weight. We shall endeavour presently to show that the writings of War Correspondents may have a most disastrous effect on public opinion at home, but we should prefer to treat this part of the subject last. The second objection Mr. Forbes considers as clearly untenable, and we are disposed to agree with him, though for a reason very different from that which he gives. The comments of War Correspondents are not likely to cause want of confidence in an army, because generally soldiers so heartily despise them. To this contempt for amateur critics Mr. Forbes himself unconsciously bears witness when speaking of the conduct of the Germans. The third objection to the presence of Correspondents in the field Mr. Forbes treats in a manner very different from that which he follows when speaking of the others, and in considering it he shows that remarkable candour which has so often distinguished his writings. After referring, rightly enough, to the littleness of our wars, he says:—

> But these rules [the rules of the Indian Government] were drawn up in view of a real war, and it is in relation to a struggle of that description that the question of the danger that correspondents may give information to an enemy has seriously to be considered. Fairness compels the acknowledgment that such a risk does exist. I have known the evil done. One journal, during the recent Russo-Turkish war, published wholly unjustifiable details of the defences of Kars, and its information was actually and naturally taken advantage of by the assailants of that fortress. Another journal printed, from its correspondent, particulars of the defences of Rustchuk, which I personally know were regarded as extremely opportune by the force contemplating its attack. I can easily imagine cases in which the simple name of the place whence a wholly innocent communication might be despatched by a correspondent known to have his wits about him, would be calculated to inspire an adversary with the suspicion of an impending movement in a region otherwise unheeded.

This is a large and startling admission; and probably Mr. Forbes's brethren will not be over-grateful to him for having made it. He

draws attention to the fact that War Correspondents working for a journal of the highest rank did deliberately disclose what they ought to have kept rigidly secret; and he admits that a War Correspondent might, even innocently, give information of considerable value to an adversary. He might have added that Correspondents may do incalculable harm by publishing exact accounts of the strength of various corps, thereby giving the information which, beyond all other, a hostile commander seeks; but he could hardly be expected to concede everything. What he does concede certainly tells strongly against the system he is defending. According to his statement, War Correspondents not only may betray secrets of great importance, but actually do so. Having very frankly admitted so much, Mr. Forbes proceeds to argue the case in his usual energetic manner. The experience of nations which have made wars on a large scale is, he maintains, in favour of taking the risks for the sake of the advantages resulting from the presence of War Correspondents with the armies; and he refers to the example of the Germans, whom he justly calls "the warriors of modern Europe." "In 1870-71," he says, "they freely admitted correspondents, imposing upon them no censorship whatsoever. As a rule, I think they trusted most to the ignorance of correspondents, and simply left them out in the cold in the matter of information, relying on the likelihood that a combination would have come off, a blow been struck and done with, before the correspondent could have grasped the situation, so as to give it injurious publicity, had he been ever so willing."

Now it must be said that, zealous as he is for the calling to which he belongs, Mr. Forbes defends it in a somewhat singular fashion. He first of all admits that War Correspondents may betray secrets of importance, and that there have been flagrant instances of such a breach of faith; and then he goes on to say that notwithstanding this they may generally be safely allowed to state what they please, because, according to the view of the Germans, who ought to know best, they are not in the least likely to have sufficient military knowledge or intelligence to find out anything for themselves, and may therefore well be left at perfect liberty. Like Lady Percy, they cannot utter that which they do not know. This is not a flattering view, but probably it is to some extent a just one, for it must be admitted that Von Moltke and his staff constitute the highest possible authority on such a subject. War Correspondents are not likely in their opinion to understand the nature of the operations which are going on around them, and therefore may be left to say what they please. What value accounts of battles and strategic movements have when written by men who may be safely trusted never to "grasp a situation" until a combination has "come off," or until a blow has "been struck and done with," it is scarcely necessary to inquire.

If, then, Mr. Forbes is right, and if the view of the German staff which he seemingly accepts is right, Correspondents may sometimes do serious harm; but nevertheless they ought to be allowed to accompany armies, because their presence is desirable, and because, generally speaking, they do not understand what is being done, and therefore can only mislead those who pay any attention to their statements. We believe that Mr. Forbes underrates the mischief which even a stupid man may do, and that he quite fails to appreciate the immense injury which might be done by men who, like the writers to whom he has referred, had some knowledge, and were totally free from any troublesome scruples. We are perfectly willing, however, to leave that part of the question which relates to the publication by Correspondents of valuable information as he has left it. If the literary gentlemen who criticize the movements of armies are satisfied with what, divested of rhetoric, appears to be his view of their capacity, they must be credited with a much more lowly estimate of their own merits than has been generally attributed to them. It would be hard to quarrel with so much modesty. There is, however, one side of the question which must be taken into consideration if Mr. Forbes's conclusion is a just one, but which appears to have altogether escaped him. As has been said, he passes lightly over what he puts as the first objection to the presence of Correspondents in the field—to wit, the effect which their communications may have upon public opinion at home. His view is, as already mentioned, that the statements by Special Correspondents which are thought likely to do harm are those which contain unpleasant truths and those which are altogether untrue. Of these he says that the latter ought to be severely punished, and that the former can never do real harm. Very likely he is quite right, but he entirely overlooks the injury which may be done by the comments and criticisms of men who are not by any means telling wilful lies, but who are dealing with a subject they do not understand. The Germans were satisfied that, for the most part, Correspondents had not sufficient military knowledge or aptitude to be dangerous, and they had far less reason than English authorities would have to fear the effect which erroneous criticism might have at home. In England this might cause very serious evil. The English public of our day is sensitive, highly excitable, and very ready to believe in the shortcomings of those who are in authority. War Correspondents—whatever their true opinion as to their own capacity may be—always write as though they were consummate masters of the military art, and as though they thoroughly appreciated all that was going on around them. They certainly do not convey to their readers the idea that they are unable to grasp a situation until a blow has been struck, or that they require special information from the staff to allow "of their following events intelligently." On the contrary, they write dogmatically and with the most perfect confidence, and, being often men of considerable literary skill, they are able to impress their views very strongly on their multitudinous readers. It is difficult to overrate the harm which might be done by Correspondents who, hastening to supply a demand for immediate and copious news, spoke with the utmost confidence about military operations which they could not at all fathom. Of course there would be exceptions to the general rule of incompetence, but probably the majority of the Correspondents would be as little qualified to understand the work of war as the German staff—whose view Mr. Forbes seemingly endorses—believe them to be. In view then of the harm which hasty and shallow writing might do, and of the grave danger that may in some cases be caused by the publication of facts which ought to be kept strictly secret, it seems clear that effectual restrictions ought to be imposed on the Correspondents of the newspapers. We do not by any means defend all the regulations of the Indian Government; but, badly framed as they are, they are based on a right principle, and, as we have shown, Mr. Forbes's furious attack on them only serves to prove what great mischief might, in a war, be wrought by writers for the press.

COLLÉ.

THE advantages and disadvantages of keeping a diary have often formed the subject of discussion. One disadvantage is rarely present to the mind of the diary-keeper, and that is the danger of betraying things about himself and his own character which it would be much better for him to have kept secret. Even when the journal is more or less consciously intended for publication, the difficulty of preventing self-revelation is considerable; when it is used as a kind of safety-valve for private feeling, such revelation is of course inevitable. There are not many men whose reputations have suffered more from the publication of their diaries than Collé, dramatist and songwriter, and, according to his own statement, the happy possessor from his birth of a "gaieté inépuisable." Collé's *Journal Historique* at its publication found its author reputed, at least among those who were not his intimate friends, as a pleasant writer of literary trifles, lyric and dramatic, who had benevolently contributed a great deal to the amusement of his fellow creatures. It left him with the not undeserved fame of being the most spiteful scandal-monger even of that spiteful and scandal-mongering age. The value of the book, and of some letters which have more recently been published, is indeed great. It is not only full of miscellaneous personal anecdote, but also contains a minute critical *compte rendu* of much of the literary and most of the dramatic work that appeared for more than thirty years. If we judge by Collé's account, his contemporaries and friends, with the exception of a few patrons, must have been the most incapable and immoral set of fools and scoundrels that ever walked this earth. Against actors especially, from Garrick and Mlle. Clairon downwards, his wrath is inexhaustible. The world, he says kindly, considers that they rank a little above the hangman, with the drawback that their services are much less necessary, and he evidently considers that the world is not far wrong. His judgments, though not devoid of acuteness where he knows his subject, are in the same way quite ludicrously harsh. In one of his letters to his son he positively forbids the latter to learn English. "It will give you as bad a taste as the classics will give you an admirable one." Shortly afterwards we find him remarking that he knew nothing of Aristophanes except through translations, so that his power of judging the classics seems to have come a little short of being unquestionable. Nevertheless, though he seems to have been in some respects a bad-hearted man, a sycophant, and a panderer to immoral tastes, though his favourite maxim that "La décence est presque toujours le masque du vice" is an obvious and paltry excuse for his own want of decency, he was a man of very considerable literary talent. His songs are admirable in their way, and were more popular than any others before the days of Desaugiers and Béranger.

Charles Collé was born in 1709, and did not die till 1783, the year before Diderot; so that he was contemporary with the whole of the great literary movement of the eighteenth century. The son of a prosperous lawyer, he seems to have made up his mind early to succeed in the world. He was a member of the Caveau, and a close friend of Piron, Panard, and Crébillon; but he had nothing of their easy-going epicureanism, and little of their tendency to disorderly living. He married early; and, whatever his writings may be, his life appears to have been decent enough. At first, like Vadé, he gave himself up to the nonsense verses which were so much the mode. It was his pride to have written a whole tragedy—*Cocatrix*—in this style; and in lesser triumphs of elaborate folly he was almost without a peer. No account of him omits a story which is indeed worth the telling. The following verses of his were once sung at Madame de Tencin's, in the presence of the veteran Fontenelle:—

> Ah ! qu'il est beau de se défendre
> Quand le cœur ne s'est pas rendu !
> Mais qu'il est fâcheux de se rendre
> Quand le bonheur est suspendu.
> Par un discours sans suite et tendre
> Egarez un cœur éperdu ;
> Souvent par un malentendu
> L'amant adroit se fait entendre.

There is really nearly as much sense in this admirable nonsense as in much of the gallant poetry of the time, and Fontenelle either took it or pretended to take it seriously. "Eh, grosse bête," said D'Alembert's mother, in the elegant language with which she usually addressed her literary friends, "ne vois-tu pas que ce n'est que du galimatias?" But Corneille's nephew was not to be twice caught napping. "Cela ressemble si fort, madame," said he, with a low bow, "aux vers que j'entends lire et chanter ici ordinairement, qu'il n'est pas surprenant que je me sois mépris." Collé, however, did not confine himself to this sort of literary frivolity; and, owing partly to the persuasions of Crébillon, partly, it is said, to those of his wife, took to serious dramatic composition and to the writing of songs. The Duke of Orleans was attracted by him, made him his secretary, and employed him for many years in writing dramatic trifles for a private theatre which he had established. Collé's dramatic performances were of very various kinds. He had, which did him credit, a great admiration for Corneille, and he showed his admiration in a way which did not do him credit, by giving *Le Menteur* a new coat and waistcoat. At the other end of the dramatic scale he was famous for his *Parades*, an untranslatable kind of farce usually performed at fairs, and partaking partly of the roughest kind of drama, partly of the monologue of the Merry Andrew. His songs, however, were his real title to literary renown.

There are few more curious studies in matters poetical than the secret of the gift of song, which is quite distinct, both in its serious and frivolous applications, from the general gift of poetry. Some great poets, such as Shakspeare, Dryden, and Victor Hugo, have had it in perfection; others, such as Milton and Wordsworth, though they might have lyrical powers of the first rank, have not had the special song-gift at all; while numbers of quite small men, who are hardly poets save in virtue of their songs, have written these latter perfectly. Collé's songs are always light—indeed, of the lightest—but they are excellent of their kind. It is, however, by no means easy—we may rather say plainly it is impossible to support this judgment by adequate quotation, owing to the license of almost all Collé's lighter work. A better instance could hardly be given of the impolicy (to put the matter on a very low ground) of indulging in this style of composition. Collé, a man of talent, and almost of genius, has by so doing actually cut himself off from the possibility of having justice done him in a more refined age than his own. His political and miscellaneous songs are naturally freer from this fault; but, the interest of their subject having for the most part evaporated, they are hardly worth citation. Otherwise it would be very easy to show that he had the gift; and his great fame as a song-writer during all the later part of the eighteenth century gives him a right to a place of some importance in literary history. A comparison of Collé and D'Urfey will seem injurious only to those who do not know the real faculty of the latter, and who judge him by the contemptuous notices of Macaulay and others, made, like most such notices, with much more regard to point than to accuracy of fact. Both the Englishman and the Frenchman had the song-gift, they were both willing to indulge the discreditable taste of their patrons, and the result in both cases has been not dissimilar. Still Collé occupies a much more important position in French literary history than D'Urfey in English, partly because of his greater cultivation and general literary power, partly because the song itself was for much longer and to a much greater degree a power in Paris than in London. There is also a third reason. The manufacture of occasional songs has never held a high place in England, though a few poets of distinction have now and then lent their hands to it. In France a whole school of such poetry or verse exists, and the eighteenth century is its palmy time. Perhaps neither the literary performances nor the personal characteristics of Collé are as interesting as those of Panard, Piron, Vadé, and Désaugiers, though he somehow leaves an impression of greater purely literary power than any one of them. With these four, however, he completes the list of the more remarkable members of what may be called the Bacchanalian school of light poetry in France during the eighteenth century. This school went on side by side with another, of which Bernis, Gentil-Bernard, Dorat, and Boufflers were the chief singers, with Bertin and Parny as a final result, and which devoted itself rather to *vers de société* and to love poetry of a languishing kind, and meddled little with the chanson proper or with popular poetry. The chansonniers, though they may sometimes have less poetical merit than their more polished rivals, are perhaps the more racy, individual, and characteristic of the two classes; and Collé is, from a literary point of view, one of their most remarkable figures. His Bacchic songs are, indeed, inferior in spontaneity to those of Panard; his political ditties, though full of spirit, include nothing that can match Piron's *Couplets de la reine de Hongrie*. He seems, indeed, to have been a man of great literary talent, who from accident or from shrewd self-seeking fell into a more or less frivolous line of composition, and persevered in it finding that it paid. To amuse his patrons was the whole end of Collé's ambition, and somehow this aim throws a disagreeable colour over his work, which is not redeemed by the undoubted fact that he was a good husband and father and a man of very regular life. Unfortunately, for a good husband and father and a man of very regular life to have written a great portion of his songs is an exceedingly questionable recommendation. Désaugiers gives value to Béranger because he enables us to see how vast a dead lift the latter gave to the chanson in point of elevation of subject and tone, of range of expression, and of variety of music. Collé in the same way exalts Béranger by comparison in respect of decency. There are songs of Béranger's which do not quite accord with English notions of decency. But there is scarcely one of Collé's, where the subject of love is mentioned, which could now be sung in any society of ordinary propriety. *Les chansons d'un âne-onyme-onissime*, as his first volume is characteristically entitled, are bad enough; those published after his death are worse. To the song before Béranger, to the *gaudriole* proper, or rather improper, no words can possibly be more appropriate than Thackeray's description of the English comic muse that Jeremy Collier sent to the Penitentiary:—"She was a disreputable, daring, laughing, painted French baggage"; and Collé served her with at least as much effrontery as any other of her servants. All the more honour is due to the remarkable poet who, born three years before Collé's death, lived to put the disreputable deity out of fashion and to substitute a worthier goddess in her stead.

AMERICAN CRITICS ON ENGLISH BEAUTY AND ENGLISH MANNERS.

THE most lively criticism of English life and manners has hitherto proceeded from the representatives of Continental Europe. By force of tradition, if not in virtue of a natural modesty of character, the Englishman regards himself as an appropriate object of satire to Frenchmen, and even to Germans. The former, through a superior sprightliness of wit, the latter by reason of a profounder mental culture, have come to be our appointed and recognized censors. So humbly do we submit ourselves to each in turn that we have lately had the misfortune to excite a certain amount of jealousy in the minds of our masters, and have been forced to endure the reproaches of the one for our morbid sensibility to the virtues of the other. But, as a fact, there is no ground of jealousy, for we have ever been the obedient servants of both. When the Parisian critic fixes us with his keen glance, we begin at once to be uncomfortably aware of the roughness of our uncouth Northern ways of life. But as soon as the learned German lands upon our coasts, the Englishman is apt to be overtaken by a sudden feeling of remorse. If he has felt himself to be but a clumsy and awkward being as compared with the light-hearted Frenchman, he now, in the presence of solid Teuton acquirements, begins to regret the incurable levity of his nature. He would willingly abandon his unconcluded pursuit of the lighter graces of social life for the sake of the deep and serious knowledge which the German offers, and he remains in this pitiable state of mental abasement until the next imported French critic begets a new and different despair. In the sharp conflict of these varying and opposite moods the poor Briton has hitherto enjoyed a single consolation. It has never entered into the head even of the most reckless among us to attempt any retort upon our Continental critics, but in our moments of deepest anguish it has occasionally been a source of relief to expend our own satire upon the inhabitants of the United States of America. The ludicrous aspects of American social life have ever been fair game, and in the enjoyable occupation of exposing the follies of others we have almost forgotten our own unworthiness. However much there might be for us to learn, here at least was a splendid opportunity to teach. Towards the inhabitants of a country so young and so inexperienced there was no need of caution or reticence. We could speak with all the candour of blood-relationship and with the conscious superiority of mature years; and thus, in striving to improve our neighbours, we were able at the same time to repair our shattered self-esteem.

But in the enjoyment of this one innocent pleasure we are not to be left undisturbed. Americans are evidently weary of listening to the long catalogue of their social sins. In suffering the penalties they have at last learnt something of the methods of international criticism, and they are now inclined to start as critics on their own account. England, so long the prey of others, is of course in this case also the first victim, and English manners, having been tested and found wanting by all the nations of Europe, are to be finally referred to an American standard. This, it must be admitted, is a most cruel return for all our past indulgence towards the inhabitants of the United States. There is no ingratitude so base as that of the worm which unexpectedly attempts to turn, and it would be obviously useless to appeal to a foe so entirely careless of the recognized laws of human conduct. It may be acknowledged, on the other hand, that the criticism is so far not unfriendly. A writer in the *Atlantic Monthly* who addresses himself to the study of "English manners" adopts a tone that may even be described as urbane, and he is clearly actuated by the most sincere desire to recognize any good qualities that we may be found upon examination to possess. He has already written of England and of certain aspects of English life in terms almost of enthusiasm, and he approaches the study of the more unfavourable elements of English character with unfeigned reluctance. But as a comprehensive and veracious observer he is bound to take account of English manners, and here at least he is compelled to confess that his finer sensibilities have been occasionally shocked. He does not, it is true, find about us anything so exquisitely droll as a Frenchman would discover; nor does he take a despairing view of our condition. Speaking generally he even goes so far as to declare that he found the "manners of the people in most respects pleasing and admirable"; but the

high spirits which such a remark would be calculated to produce are chastened by a subsequent opinion to the effect that as a nation we have no manner at all. "There is simply the absence," says the writer, "of pleasing outward demonstration, a reserve so absolute, and yet so unconscious (unconscious, perhaps, through long habit and continued practice) that it seems to be indifference." The exceptional polish noticeable in individual instances he ascribes to the "hard tough material" which, like agate, is capable under favourable conditions of producing an exquisite surface. Generally, however, he has found in England the combined qualities of roughness and sincerity. In society the Englishman's "social word is his social bond"; but, on the other hand, we labour under the disadvantage that "the God of English social life next in dignity to Mammon is Propriety." Everybody tries to do the "correct thing," and, having attained this, the Englishman feels that he has "absolved himself from every social duty and clothed his soul in panoply of proof." "The forbidding manner of Englishmen" is due, we are told, in great measure to the influence of the aristocracy and the constant pressure upward of the inferior ranks." To this cause, we suppose, must be ascribed the formidable place occupied by dining in the English social scheme. It seems that Americans who are unfortunate enough to come to this country armed with letters of introduction are bored to death by invitations to dinner; and the writer congratulates himself that he personally was enabled to escape the infliction. Certainly, if his account of the ordinary English dinner is to be accepted as correct, he is to be most sincerely congratulated. Not only is the meal conducted with deadly formality, but "the host and hostess even arrange what subjects shall be started to bring out certain guests." The table is hushed while a clever man discourses, and occasionally a single conversationalist is allowed to occupy the whole evening. Indeed so terrible in its formality is the English dinner that a special dress is required. At this point the writer fairly rebels. That a gentleman should at all times be "scrupulously nice" in his dress he admits, but that he should be attired, like the waiters and the butler, in a swallow tailed dress coat and a white neck-tie he cannot understand. Still less can he comprehend the liberties which persons so attired occasionally allow themselves. Evidently if a man is dressed like a waiter he ought to behave with becoming modesty; but the writer assures his readers that he has seen "a peer" sitting after dinner in the drawing-room scratch his leg, and this too in the presence of ladies. That a peer should scratch his leg at all is, we may admit, a fatal blow to aristocratic institutions; but that he should scratch his leg in a dress coat is indeed a humiliating fact.

The condition of national abasement which such criticisms are calculated to produce will be still further intensified by the remarks of a second writer, who undertakes to expose the defects of our personal appearance. Dr. Beard, in an article published in the *North American Review*, approaches the English character from a medical point of view. He enters upon an instructive comparison of "English and American Physique," and he takes occasion to point out with all gentleness, but with the most relentless logic, that on purely physiological grounds it would be idle to expect in the typical Briton anything like the beauty or the refinement possessed by the typical American. It is, as he clearly proves, rather our misfortune than our fault that we are doomed to occupy an inferior place in the human family. He is not so harsh as to deny a certain resemblance between the inhabitants of the two countries—indeed he even goes so far as to declare that all the characteristic vices of American society are of distinctly English origin; but, when he comes to deal with the question of personal beauty, he is forced in candour to announce that we have been far outstripped in the race. "American beauty," we are told, "has this sovereign advantage, that it bears close observation." This, no doubt, is a point of importance to a people of domestic habits, and it is certainly distressing to learn of the English maiden that "she grows homely as we approach her"; and that, although the ruddiness and freshness of the face serve well enough "when partially veiled or when a few rods away," yet on a nearer view these excellent qualities "retreat behind the irregularities of the skin, the thickness of the lips, the size of the nose." There is nothing in the English face of that "automatic play of emotion in the eyes and features," and without this, as the Doctor eloquently observes, "female beauty must always fall below the line of supreme authority." It would at first sight seem highly presumptuous in a country labouring under these disadvantages to think about personal appearance at all; but Dr. Beard is quite willing to concede to us the possession of a certain amount of beauty, if only we clearly recognize the source from which it springs. The race of "professional beauties" will, we feel sure, be relieved to learn that he does not altogether neglect them. They are reminded, however, that it is only by force of contrast that they enjoy any kind of supremacy. "The English beauties of national or international fame at whose feet the Empire is now kneeling are of the American type, and in this country they would be regarded simply as of average rather than exceptional excellence." There is a sting in this last clause that will doubtless produce a considerable amount of suffering, and an amiable critic like Dr. Beard would scarcely have inflicted such a blow if he had not reflected that women in England are made of tough material, and have not the "superior fineness and delicacy of organization" of their American cousins. They are not, as he observes, "impressed by mild irritation acting upon any of the senses." And of this comparative insensibility their costume affords ample evidence. "The American girl," notwithstanding the fact that she goes to Paris for her dresses, would be shocked by the bright tints worn in Europe. She is so highly organized that the most subdued and sober colours sufficiently excite her imagination, and were she compelled to confront any positive hues, "the irritation of such splendour would become a pang." In short, if the truth is to be spoken bluntly—and there is clearly no need of any excess of consideration in dealing with the inert and sluggish nature of our countrywomen—the American girl has only one fault. She is, beyond question, "a thing of beauty," but she is not "a joy for ever." Compared with her English sister, she does not last, and this is the more regrettable seeing that, "if archæology is to be trusted, America is a modern Etruria, the delicate features and fine forms of prehistoric Italy emerging from the entombment of ages and reappearing in a higher evolution in the Western Hemisphere."

OLD MASTERS AT THE ROYAL ACADEMY.—I.

THERE seems to be no deficiency in the supply of pictures for the annual exhibition of Old Masters at Burlington House, which this year has some unusual attractions, notably in the room devoted mainly to pictures by Holbein or his imitators.

The first gallery holds three examples of the work of a painter—the late Mr. Joseph Severn—whose pictures are seldom seen. One of these, "Ariel" (26), is singularly charming in tone and colour, and full of a delicate and romantic fancy, which at the time when the picture was painted few people attempted to transfer to canvas. Another, "The Ancient Mariner" (4), displays a fine quality of imagination, which gives it an attraction that overrides its technical faults. The third, "Roman Peasants in the Campagna" (16), painted on a peculiarly rough Italian canvas, is fine in grouping and colouring, and remarkable for the truth and beauty of the effect of light upon the distant hills. "Somer Hill, near Tunbridge, Kent" (11), is a beautiful specimen of an early Turner, full of atmosphere, radiant with light, and most striking as a composition. It may be noted that the masses of foliage are less "made out" than one might naturally expect them to be. Near this is a curiously *fade* picture, by Sir Joshua Reynolds, of "Maria Walpole, Countess Waldegrave, afterwards Duchess of Gloucester" (14). To balance this there is a three-quarter face portrait by Sir Joshua of Edmund Burke (25), which is singularly impressive, and gives one a clearer and better notion of the man than any of the profile likenesses which exist. Romney is represented by a portrait of Miss Lucy Vernon (29), of Lady Hamilton (31), and again of Lady Hamilton as a wood-nymph (37). The first of these is admirable in its grace and simplicity. The lady is represented sewing, and the action of the hands is especially beautiful. The Catalogue informs us that this picture is "generally supposed to be intended for a portrait of Lady Hamilton," although the name of Miss Vernon was found written on the face of the picture and on a piece of paper pasted on its back. We have only to look at 31, a recognized portrait of Lady Hamilton, to be convinced that the "general supposition" quoted by the Catalogue is probably mistaken. We may note, in passing, the singular piece of history appended in the Catalogue to 31:—"Emma Lyon or Harte; a favourite model of Romney's; m. Sir W. Hamilton, English Ambassador at Naples; and became well known for her friendship with Lord Nelson." The third Romney is well known by the engraving to which the Catalogue assigns the name of "Rhodope," and which is, we fancy, really called "Alope." Not far from these are two pictures, "Sands at Sunset" (32) and "Subject from *Peveril of the Peak*" (34), by Bonington, a painter who, oddly enough, is less generally well known in England than in France, where he stood to the painters in much the same relation in which Scott stood to the writers of the romantic school. His influence is traceable in much of the work of the then new sect, in the paintings of Delacroix, and in the "mélancolie si vague et si douce" of Devéria's works. It is curious to read now of the struggles of the 1830 period, and to find the obscure author, himself a romanticist, of the first book which appeared on romanticism writing that Delacroix "est romantique sans doute, car il innove; mais il est certes encore plus mauvais et plus ridicule que les classiques mêmes quand ils ne veulent pas que l'on donne des armures aux individus qui se battent; ni qu'on pleure, ni qu'on meure sans une pose académique." We may perhaps be justly proud of the influence which Bonington exercised on the painter thus oddly criticized; and we may be in a still greater degree thankful that nothing is owed to English inspiration by the French painters who at the present day fancy they correspond to the romanticists of 1830.

If the name romanticism had been invented in the eighteenth century, it might perhaps have been applied to Chardin, who, at a time when gods, goddesses, shepherds, and nymphs, the types of Watteau, Lancré, Pater, and, in a different line, Boucher, were all the rage, hit upon the original notion of taking people and things just as he found them in *bourgeois* life, and making as accurate and well-arranged a picture of them as he could. His still-life performances are known to all frequenters of the Louvre Galleries, and we have here two beautiful examples of his work, combining movement with still life, in "La Blanchisseuse" (33) and "La Fontaine" (41). The technical skill is almost perfect, the feeling charmingly simple and fine. The works are worth close study. Under one of them is hung, not inappropriately, a specimen of Morland,

"Trepanning a Recruit" (42), which is curious because it looks as if it had been painted in conscious and successful imitation of Greuze's manner. Near this is a quaint little Hogarth, "Garrick, in the Green-Room," with an odd figure of Fame, not mentioned in the Catalogue description, hovering in the background. The arrangement of colour is particularly striking. Close to this, again, is a Nollekens, "Old Covent Garden" (45), which might almost pass for a Hogarth save for the inferior technical skill in some of the details. It is not easy to see the point of the curious symbolical device, much in Hogarth's manner, by which the painter has chosen to place a man crossing the square in such a way that the pile of baskets which he carries on his head comes exactly between the spectator and one of the columns of Inigo Jones's church, while the top baskets of the pile, which are slipping down, suggest to the eye, and are no doubt intended to suggest to the mind, a catastrophe to the column of which in the picture they occupy the place.

The most important picture in the Second Gallery is the beautiful "Portrait of a Boy" (88), by Albert Cuyp. The work, masterly in every way, is one that cannot fail to attract and retain the attention; and it is curious technically for its close resemblance to the handiwork of Jacob Gerritsz Cuyp, Albert Cuyp's father. The same room contains two or three less striking Cuyps, painted more in his better-known manner, and two fine specimens of Both. There is also an admirable Jan Steen, "The Guitar Lesson" (71), and an equally admirable Terburg, "The Glass of Lemonade" (77). The picture called "Rembrandt's Mill" (82) has many points characteristic of the master; but is curiously grey and cold in tone, and has some qualities in common with the landscape (80) by De Koninck, which is hung near and above it. We may call special attention to an exceptionally beautiful Metzu, "The Tête-à-Tête" (74), and to a perfect specimen of Watteau, "The Masquerade" (75). On the opposite wall hangs a fine portrait, lent by the Duke of Norfolk, and exhibited for the first time, of Thomas Howard, Earl of Arundel and his grandson, by Vandyck.

One of the first pictures in the third room is a "Mater Dolorosa" (97) signed "Titianus." The head and shoulders are those of the mourning Madonna in the Entombment at the Louvre, and the close and tragic pressure of the hands together is most striking. In the "St. Mary Magdalene" (99), attributed to Veronese, fine as it is, there are certain points, especially in the complexion and colouring of the head and in some of the drapery, which seem to have more relation to the work of Zelotti than to that of his master. With regard to the picture (102) set down as a portrait, by Sebastian del Piombo, of Michael Angelo, Mr. J. C. Robinson has given, in a letter to the *Times*, some very good reasons for supposing that it is more probably a portrait, by the painter himself, of Baccio Bondinelli. Certainly the face is not the face which one knows of Michael Angelo; and Mr. Robinson points out that what the Catalogue calls a "gold chain with a coral cross attached" is really the order of Santiago, possessed by Bondinelli and not by Michael Angelo. A beautiful Palma Vecchio, "Violante" (124), painted, which with this master was unusual, on a panel, is hung far too high. The effect of the unusual method is to give an equally unusual smoothness to the painting. Every opportunity should be afforded of studying closely a work of this importance. At present it would only be possible to do this if one mounted on a pair of steps. Attention will be attracted by a fine Tintoretto (110), and for other reasons by an obviously miscalled Moroni (121). Two fine Canalettos come from Windsor Castle, one of which (113) is strikingly free and spacious. On the same wall with them is a fine Van de Velde (115). There are several portraits by Gainsborough and Reynolds in this gallery; and there are two Gainsborough landscapes, one of which, "The Harvest Waggon" (140), is magnificent in its movement, its composition, and its sense of freedom in the open air. The same quality of breeziness and freshness is shown in a marked degree in the landscape which belongs to this painter's portrait of the twelfth Duke of Norfolk (132). An exquisitely beautiful specimen of Sir Joshua's work is exhibited in "Simplicity" (116). Another Sir Joshua, "Portrait of Lady Elizabeth Compton" (135), is full of beauty and attractiveness. It is further remarkable because it exhibits some strikingly false drawing, which, however, as Charles Lamb said of some false drawing in a picture by a yet greater master, "cannot be gainsaid," because one could not wish the effect to be anything but what it is, even though it takes daring liberties with human possibilities. We reserve notice of the remaining galleries for a future article.

REVIEWS.

MACKENZIE'S NINETEENTH CENTURY.*

THIS history of the events of the nineteenth century has the merit of being compact and readable. To many people its somewhat commonplace sentiment and tone of complacent Liberalism will no doubt be an additional recommendation. The author's personality, as the modern slang is, makes itself distinctly felt. His nationality also would be clearly perceived even without the assistance of his name on the title-page. He persistently styles English boroughs "burghs," even when writing of the Reform Act of 1832, from a perusal of which he might have learned the term used south of the Tweed. He dates an English Act as "passed in 1350, soon after the battle of Bannockburn." A Southron would have dated it soon after the battle of Crécy, which approaches the date under consideration nearer by thirty-two years. Racy of the soil too is the information that, as a result of the restoration of Catholicism under Napoleon, "the Sabbath became again the weekly day of rest." So also are the words put into the mouth of the dying Cavour, "I will not be here to-morrow." The author's views on things in general are of the ordinary Liberal kind. He expresses the usual amount of amiable abhorrence of war—unless indeed the war be very little, and waged with barbarians. At least this is the interpretation which an enemy might put upon a passage at p. 177, in which the author takes comfort in the thought that the wars of England during the last sixty years "furnish evidence that the spirit which drove us so constantly into strife has undergone vast amelioration." The evidence appears to be that, with the single exception of the Crimean war, "which recalls the fighting period of our history," "we have contented ourselves with little wars and easy conquests over weak and barbarous States." And after drawing a distinction between being really "at war" and "inflicting chastisement, more or less justifiable, upon barbarians," he adds that the fact that England "deemed it necessary to do" the latter "is not inconsistent with the increasing prevalence of a genuinely pacific temper among her people." We believe indeed that this exactly expresses what some people understand by a pacific temper. The pacific temper has a mighty strong aversion to a war in which its own head or its own shop-windows may get broken. Such strife is "monstrous," "brutal," "needless," a "coarse method" of solving a question. But "chastising"—which means killing—barbarians whose arms are not long enough to reach to the pacific Briton at home is another matter. Mr. Mackenzie, we quite admit, will repudiate any such sentiments as these; and the severe condemnation which he passes upon the Zulu war is alone sufficient to justify him. But, as often happens, he utters his platitudes without seeing clearly what they come to. In the very passage in which he rejoices over our amelioration, he mentions jauntily that "we had a toy war with Persia." Such a phrase may be proper enough in the mouth of the military man to whom war is a science or an art. But, from the humanitarian point of view, one war is not more toylike than another. It was as grim a reality to the seven hundred Persians who fell in one of the battles of that war as it would have been had their number been multiplied ten, twenty, or a hundredfold.

We need not further discuss Mr. Mackenzie's views upon war in the abstract, and upon the folly of being prepared for war. In Tony Lumpkin's phraseology, we may say at once, "To be sure, wars of all kinds are d—d bad things." But one may hold this opinion, and yet be just to the motives which impelled our ancestors to war. Mr. Mackenzie, in his brief survey of the earlier wars of the eighteenth century, is apt to leave out of sight the real cause of them. Striving to be sarcastic, he says, "It was our high purpose to prevent the grandson of the King of France from becoming King of Spain." True, but the historian will ask why we objected to the grandson of the King of France becoming King of Spain. Because, rightly or wrongly, we thought that it would dangerously augment the dreaded power of Louis XIV. "And after all," continues Mr. Mackenzie, "the French prince was King of Spain, and Europe was not perceptibly a greater sufferer than she would otherwise have been." But the power of Louis XIV. had by that time been broken; and, though his grandson did become King of Spain, it was not to the undivided Spanish dominions that he succeeded. After mentioning the War of the Austrian Succession, the author goes on:—

> After a short breathing-time, we resumed our accustomed toil. In 1756, leagued with Prussia, we entered upon a seven years' war against France, Russia, Sweden, and Austria. We had no apparent interest in the quarrel, but Prussia was in danger, and had persuaded us to come to her rescue.

Does Mr. Mackenzie really think that it was only *pour les beaux yeux* of Frederick the Great that we went to war with France? Has he never heard of Pitt's saying that America had been conquered in Germany? Any school history would have told him that, as far as we were concerned, the war arose out of territorial disputes between the English and French colonists in America, and that it was a common hostility to France that leagued us with Prussia. In truth the war, which if it had not arisen in one way would in another, was waged to decide whether the French or the English race should be supreme in America and India. Of course true happiness may not consist in having a colonial empire; neither perhaps does it consist in having a large private fortune; but to the men of the eighteenth century the possession of a colonial empire seemed as obviously advantageous to a nation as the large fortune to an individual. Next the author remarks that "a short war with Spain might almost be deemed a favourite pastime of the statesmen of the eighteenth century," and he then gives a list of Spanish wars, among them that of 1739. Mr. Mackenzie must have forgotten that it was the people of England who forced the statesman at the head of affairs into that war, sorely against his will. When Walpole uttered his famous pun:—"They may ring the bells now; before long they will be wringing their hands," he at least did not look on the Spanish war as a pastime.

* *The 19th Century: a History.* By Robert Mackenzie. London, Edinburgh, and New York: Nelson & Sons. 1880.

Mr. Mackenzie has moreover views upon the land question, and considers competition with America hopeless "at present inflated rentals." The receivers of rents would be inclined to describe their present state as one of collapse rather than of inflation. The author is a sound and zealous Free-Trader—a fact which some years ago one would hardly have paused to notice, but which in the present resurrection of economical heresies may be accounted to him as no small merit. We quote, as a fair specimen of his style and tone, the contrast he draws between legislation before and after 1832:—

The ruling idea of legislation before 1832 was Protection,—special privilege bestowed upon some special class or interest at the expense of other classes or interests. Every one was protected. The landlord and farmer were protected by laws which shut out foreign grain and foreign cattle, and levied a heavy duty on foreign wool and timber. The shipowner was protected by a law which forbade the entrance of goods unless they were conveyed in British ships, or imposed heavy additional duties on those which foreign ships were allowed to bring. The manufacturer was protected by heavy duties on silks, woollens, and linens, on paper, on glass, on iron,—indeed on nearly every manufactured article which foreigners could send. Liberal grants from the public funds encouraged him to export his products to foreign markets. For his benefit the export of English wool was prevented. He was further protected by a law which forbade the emigration of artisans; by another law which forbade the exportation of machinery; and by yet another law which forbade the combination of workmen, lest the price of labour should be advanced. Every one was raised up on some special platform of artificial privilege and superiority—every one but the working-man, who, having no voice in Parliament, was regarded as the common prey of those who had.

The ruling idea of legislation since 1832 has been that legislation has no favourites; that all men are equal in the eye of the law; that all men are entitled to protection of life and property, and that no man is entitled to more. Before 1832, legislation occupied itself with the creation of special advantages for the benefit of favoured classes at the expense of those who were less favoured; after 1832, legislation occupied itself with the overthrow of all those iniquitous preferences.

Here, as elsewhere in his work, Mr. Mackenzie writes in the tone of a partisan, not of an historian. The theory of Protection—we are not speaking of its practical results—is not founded on any abstract love for favouring one man at the expense of another, but on the notion that the country as a whole benefits by consuming its own productions. It is characteristic of the school to which he belongs that he should reserve all his anti-protectionist bitterness for his own countrymen. We read of "the rage of defeated monopolists" at the repeal of the Corn Laws, as if the Tory squires and farmers were chained fiends chafing at their impotence to hurt. But when the United States take to Protection Mr. Mackenzie's tone softens at once. "The Americans," he says mildly, "seek to be independent of supplies from abroad." Precisely on this ground were the Corn Laws defended. The fact is that, now that Protection is becoming an especial characteristic of popular governments, it is time to leave off throwing stones at its aristocratic supporters in time past. Like most enthusiasts, Mr. Mackenzie does not pay scrupulous attention to details. The extract already given conveys the idea that all the bad things enumerated were rampant until the Reform Bill of 1832 became law. Now the prohibitions on the export of wool, the seducing of artificers into foreign parts, and the combination of workmen were removed in 1824. Of the last fact indeed Mr. Mackenzie has in an earlier passage shown himself aware, though for rhetorical purposes he refers all reforms to the great and glorious year 1832.

The chapter entitled "The Reform Bill" is good, and not overcoloured, except in its account of the "Manchester massacre":—

The government was resolute to extinguish, by military force, the discontent of the people. The Manchester reformers held a meeting of sixty thousand persons, with no design but to petition for Parliamentary reform. A strong military force was provided by the authorities—infantry, cavalry, and artillery. The proceedings had scarcely begun when a large body of mounted yeomanry dashed at a rapid trot among the defenceless multitude. Many persons—men, women, and little children—were carried from the field killed or injured. The thanks of the prince-regent were promptly offered to the magistrates who had directed this wicked and cowardly slaughter.

These phrases are probably taken from some contemporary expression of indignation, and might be considered fair enough at the time. But at the distance of sixty years it ought to be possible to look at the event calmly. Mr. Mackenzie's language would lead his readers to suppose that the magistrates, anticipating the policy ascribed to the contrivers of the *coup d'état*, deliberately purposed that there should be a slaughter, in order to strike terror into the disaffected. How little intention there really was to slaughter is shown by the small number of the slain. It seems to be admitted that only six lives were lost, including those of a special constable who was accidentally ridden over by the hussars, and a Manchester yeoman who was struck down by a brickbat. The epithet "cowardly" may perhaps be deserved, seeing that, as usual in such cases, the mischief sprang from the authorities being in a fright, and acting, like frightened men in general, with what Sir Erskine May characterizes as "inopportune vigour." Their object, of which Mr. Mackenzie says nothing, was to arrest Hunt and other speakers, and for this end a troop of Manchester yeomanry, some forty in number, was brought up—whether at a trot or a walk is a disputed point—to support the constables. Then, in order to rescue the handful of yeomanry, which had got hemmed in and broken up by the pressure of the multitude, the 15th Hussars were sent at the crowd, and swept the whole mass, "people, yeomen, and constables," before them.

Foreign affairs occupy a large part of the book. On the Eastern question the author has adopted and vigorously advocated the views of which Mr. Gladstone and Mr. Freeman are the most eminent exponents. "The system of organized robbery which is known in Europe by the name of the Turkish Government" is a phrase which sounds like an echo of Mr. Freeman's denunciations. The chapter on France is one of the best written in the book; and its account of the *coup d'état*, and of the part played by the President, though strongly condemnatory, is not too severe. We will wind up our notice with the concluding paragraph of Mr. Mackenzie's work. Melancholy people who believe that we are fast tending towards despotism, Cæsarism, Protection, anti-Christian persecutions, or, worst of all, that condition of blank and hopeless indifference and despair with which Mr. Mallock threatens us, may feel some envy of one who is so joyous over the work of the nineteenth century, and so confident of human progress:—

The nineteenth century has witnessed progress rapid beyond all precedent, for it has witnessed the overthrow of the barriers which prevented progress. Never since the stream of human development received into its sluggish currents the mighty impulse communicated by the Christian religion has the condition of man experienced ameliorations so vast. Despotism thwarts and frustrates the forces by which providence has provided for the progress of man; liberty secures for these forces their natural scope and exercise. The nineteenth century has witnessed the fall of despotism and the establishment of liberty in the most influential nations of the world. It has vindicated for all succeeding ages the right of man to his own unimpeded development. It has not seen the redressing of all wrongs; nor indeed is that to be hoped for, because in the ever-shifting conditions of man's life the right of one century becomes frequently the wrong of the next. But it has seen all that the most ardent reformer can desire—the removal of artificial obstacles placed in the path of human progress by the selfishness and ignorance of the strong. The growth of man's well-being, rescued from the mischievous tampering of self-willed princes, is left now to the beneficent regulation of great providential laws.

GIFFEN'S ESSAYS IN FINANCE.*

In one of the essays in this volume Mr. Giffen remarks upon the continuity of Mr. Gladstone's mind in matters of finance. No one who carefully peruses the author's own work as here presented can fail to be struck by the same characteristic. The essays—fourteen in number—have been written at different times; the earliest so long ago as 1867, the latest only last year. They were intended in some cases for periodical publication, in others for private circulation, and in others to be read before learned Societies; while often the subject was occasional. Yet, while each is complete in itself, depending neither for elucidation nor support on what follows or precedes, there is a connecting thread running through all which makes them, when collected, appear parts of one connected whole, and forms out of the entirety a fairly full presentment of the economic development of the past ten years.

The first in the volume, that on "The Cost of the Franco-German War," at a hasty glance would appear almost exclusively political. The crushing burden imposed upon France and the gain acquired by Germany have been prime elements in determining the relations of nations one to another during the period that has since elapsed. But their bearing upon the production and distribution of wealth is not so obvious. Yet it has been both intimate and powerful. Without noticing the influence upon France itself, it is enough to observe that the payment of the indemnity to Germany enabled her to substitute a gold coinage for a multiplicity of silver coinages, and in doing so to demonetize silver. Notoriously the change thus introduced has exercised an immense influence on the money markets of the world, and has been the beginning of the depreciation of silver. Writing in the early months of 1872 it was of course impossible for Mr. Giffen to foresee all the economic consequences that have followed from the financial arrangements of the peace of Frankfort. Yet even then he perceived how important must be the results of the adoption of a gold coinage by the new Empire, and he brings them out with striking effect. It is, therefore, fitly that he places this essay at the beginning of the volume, as dealing with what may be regarded as the starting-point of the economic history of the ten years now ended. We may remark, in passing, upon the extraordinary degree of accuracy attained by the author in estimating the cost of the struggle to each of the belligerents, although he wrote at a time when the Germans were still in occupation of the eastern departments of France, when the second great French loan was not yet raised, and when, moreover, owing to the destruction of the Paris Ministry of Finance by the Communists, the French accounts were necessarily in disorder. So great is this accuracy that, in publishing the essay now, he is able to dispense with corrections and supplementary details. Resuming our remarks, we would observe that at first sight the essay on "Mr. Gladstone's Work in Finance" may seem to have little connexion with the main subject of the volume. In the hands of an ordinary writer the paper would inevitably have become a piece of partisan exultation, or a personal panegyric. In the paper before us there is nothing of the kind. Mr. Giffen deals with his subject only to show how the work begun by Sir Robert Peel was continued by his disciple, and how it has contributed to increase the well-being of the masses of the people, and to augment that marvellous accumulation of wealth which Mr. Giffen has traced in another striking paper noticed by us in these

* *Essays in Finance.* By Robert Giffen. London: George Bell & Sons. 1880.

columns at the time when it was read before the Statistical Society. The continuity of thought which we pointed out even where it is not at first sight evident affords proof of the minute and profound study which the author has long given to this class of subjects, of the thoroughness with which he worked every problem for himself, and of the close attention with which he has followed the events of contemporaneous history. Another quality that honourably distinguishes these essays from too much of the occasional literature of the day is the rigour with which the scientific method is applied to the elucidation of every question dealt with. There is no superficiality of treatment, or claptrap arguments, or re-echoing of popular verdicts. Everything put forward to account for the phenomena under discussion is brought to the test of first principles. Necessarily these phenomena are found to be not isolated disjointed facts, but effects of the causes at work in society, illustrating in action the laws of political economy. In their connexion they illustrate the economic history of the period under review.

The main economic features of the period treated of are the growing scarcity of gold, first made apparent by the extraordinary demands of Germany for its new coinage, and intensified by the American demand for resumption purposes; the depreciation of silver; and the great trade depression of the last six years. With the latter subject six out of the fourteen essays deal directly, while several others have an indirect bearing upon it. Mr. Giffen, we need hardly tell our readers, gives no countenance to the crotchet-mongers who would attribute the depression to foreign competition, the deterioration of the British workman, Protection abroad, or the depreciation of silver. Neither does he take the view of those who regard the depression as exceptionally severe, or as likely to prove permanent. On the contrary, he points out, in a couple of papers which we would recommend to the study of any one who may still be doubtful as to the commercial future of the United Kingdom, that the depression began in the raw-material-producing countries, that there are special reasons why it should be greater in these than in the more advanced nations, that its effects became universal, but that they have been lighter in England than elsewhere. The latter statement may appear startling to those who are still under the impression of the complaints so loudly made of late by manufacturers and traders; but we have no hesitation in saying that Mr. Giffen appears to us to establish his case conclusively. And the reason is not far to seek. The depression had its origin in the breakdown of the business of foreign loans—of lending, that is, to new and backward communities. Over-production was stimulated in the borrowing countries, and the distress that fell upon these in consequence was extreme. In England, however, the loss fell upon financial institutions and capitalists, not upon the producing classes, and the falling off in trade which resulted from the inability of our foreign customers to take the usual amount of our goods affected a mere fraction of our total business. This is a point which is not in accordance with the commonly received notions on such subjects; but Mr. Giffen's demonstration is complete. Our whole foreign trade is small compared with our home trade, and it was only a portion of the foreign trade that suffered. The position is further fortified by the fact that there has been no great scarcity of employment such as would throw the vast multitudes out of work and increase enormously the pauper roll; that, moreover, saving has been going on upon a vast scale all the time there have been such loud complaints of the unprofitableness of business, and that investments of all kinds have likewise been continued. In short, although the depression has been very protracted, it has, here at home, been singularly light, there having been no actual panic, no serious augmentation of pauperism, and no widespread acute distress, in spite of a long succession of bad harvests coming to intensify the effects of the causes above referred to, and of the injury done to credit by such a gigantic fraud as that of the Glasgow Bank. As regards the future, Mr. Giffen is sanguine, and is inclined to look forward to an outburst of prosperity even greater than that which followed the close of the Franco-German war.

The subject of the gold scarcity is peculiarly Mr. Giffen's own. Among economists of reputation we believe he was the first to direct attention to it. Eight years ago he called in question the correctness of the view then prevalent, that there had been in consequence of the gold discoveries in California and Australia a great rise of general prices, or, in other words, a great depreciation of gold. He maintained, on the contrary, that the rise of prices had been quite small. He added, in still further opposition to the prevailing opinion, that the depreciation was not likely to go further, but that a scarcity of gold was more probable. The German purchases for the new coinage had then only recently begun, but he saw that, if continued, they must absorb much more than the surplus then available after supplying the current wants of the world, and he established his position by irrefutable statistics. At intervals since then the author has incidentally recurred to this subject, the latest occasion being in the paper on "The Fall of Prices," which is the last in the volume before us. After showing, as some of our readers may perhaps remember, that the fall was to a lower level than in any previous depression since the gold discoveries, as likewise that the rise in the preceding inflation period was not so high as in former inflation periods since 1850, he threw out a suggestion that the fall was possibly aggravated by the scarcity of gold. And in support of this view he pointed to the extraordinary absorption of gold by Germany, the Scandinavian kingdoms, France, and the United States. The suggestion is eminently deserving of consideration, but existing data do not suffice either to establish or refute it. But whatever may be thought of Mr. Giffen's suggestion in reference to this subject, we anticipate that amongst economists of standing there will be no difference of opinion respecting his views on the depreciation of silver. The course of events has already to some extent verified his inference from the experience of the past, that the so-called depreciation is in reality nothing more than a temporary fluctuation, similar in kind to forgotten fluctuations in the value both of gold and silver, though no doubt more extreme than has often been witnessed, and therefore certain to come to an end with the causes that have brought it about. As yet only one of these causes has ceased to operate—the German sales of silver; but there has already been a very great recovery of value; and, if no new cause of disturbance intervenes, it is manifest that there must be a further considerable recovery. Mr. Giffen, therefore, is fully justified in the position which he took up from the first—that it would be foolish to meet a temporary difficulty by a permanent change of an approved policy. He is not blind to the losses which the depreciation has caused; but he holds, on good grounds, that the remedies proposed would simply make matters worse. Of these remedies the only one he discusses in the volume before us is that known by the name of bi-metallism, and he very completely disposes of it. We have already seen that he was among the first to recognize the growing scarcity of gold, and he is therefore not likely to under-estimate the importance of any measure which would really prevent a sudden change in the purchasing power of the standard of value. But, as he points out, the merit claimed by bi-metallists for their pet remedy, that it would keep in circulation both silver and gold, really does not belong to it. This the history of every country with the double standard establishes conclusively. A much more effectual method of attaining the end in view is that some countries should have a gold and others a silver standard. But we have discussed this question so fully on former occasions that we need say nothing further respecting it. With this scanty notice we must take leave of a work which, we cannot doubt, is destined to enhance the already high reputation of its author. It exhibits qualities not often combined, but which, when found together, give exceptional value to the work of the scientific inquirer—the power of surveying a vast mass of facts, of classifying and reasoning from them, together with an eye for the most minute details, and capacity for wearisome and monotonous labour.

PROCTOR'S ROUGH WAYS MADE SMOOTH.*

MR. PROCTOR is indefatigable in catering for the popular appetite for all that is most novel and striking in the advances of science. He has also the art of putting forth in a fairly accurate and lucid form the facts and theories which mark the latest points of progress in the various paths of physical investigation. If his matter is at times a little thin, and his manner by no means habitually up to the standard of style with which we are made familiar by the great masters of scientific exposition, yet we cannot doubt that good service is done towards the spread of knowledge among the unprofessional students of nature, and a wholesome interest in the labours of our more advanced pioneers kept up among the general public, by means of popular essays such as those in the volume before us. We have here a score of papers ranging over almost as many detached subjects, from the sun's corona and his spots to the influence of the mind on the body. If some of these themes may appear from their titles to be in no way connected with science, it will yet, he ventures to assert, be found that none have been treated otherwise than in their scientific aspect, though in familiar and untechnical terms. A certain tendency to dogmatize, as well as to leap without much support from evidence to novel and paradoxical conclusions, which we have so often had occasion to remark in his writings of this class, is less conspicuous in his handling of the problems here brought forward.

In his opening essay, for instance, on the sun's corona in relation to the spots on his disk, Mr. Proctor is careful to admit the existence of a degree of mystery which precludes for the present any distinct or confident conclusion. The sun-spot period itself is a point on which anything but a consensus of observers and theorizers has been attained. Still more involved in mystery is the cause to which these spots, whether periodic or casual, are to be traced. Mr. Proctor, we are glad to see, does not adopt the notion lately received with some favour that they are produced by the action of the planets. With about equal plausibility planetary influence has been put forward of late to account for abnormal seasons like the last and present winters. Was it likely, it was asked, that a conjunction of four principal planets, such as was to be seen during the recent autumn, prominent among them being Mars, the planet of strife and war, and Saturn, proverbially known to be of malignant and insidious character, could take place without disturbing our atmosphere and bringing about storms, floods, droughts, scarcity, and distress of nations, or what not? The fears of the unscientific public have, we believe, been since to some extent appeased by the assurance that, alarmingly close as these orbs appeared to

* *Rough Ways made Smooth: a Series of familiar Essays on Scientific Subjects.* By Richard A. Proctor. London: Chatto & Windus. 1880.

the eye, their relative position in space was quite another affair. Exceptionally near as Mars might be for the time, coming within 80 million miles or so of us, Saturn, though almost in a line with him, was not so near as 800 millions, at which distance our summer and winter need hardly fear much from his malefic frowns. Mr. Proctor has never given in to the theory of sun-spots as the periodic cause of droughts at Madras, or watery skies in Great Britain. He sets himself to ask, in the spirit of a scientific inquirer, what is really to be known of spots in the sun, and how they stand related to the phenomena of the corona at large, the sierra, the coloured prominences, and the zodiacal light. It is to the exceptional opportunities afforded by eclipses of the sun that we turn with most hopefulness for the key to this enigma. One of the most important results of the observations made on the great eclipse of July 29, 1878, was the indication of a law of sympathy, so to speak, between the solar corona and the sun-spots. That eclipse chanced to coincide with a minimum of solar maculation. Hence, doubtless, in great part the cause of the wide difference of aspect between the solar corona on that occasion and in previously recorded eclipses, such as those of 1870 and 1871, when sun-spots were numerous. In those two years the corona was seen to extend at least 250,000 miles from the sun's limb. But in 1878 it reached to no more than 70,000. On the earlier occasion it was complicated in structure, pink in colour, and bright with glowing gas. On the latter, there were only two parts of the corona in which any definite structure could be recognized, its aspect was pearly white, and its light—chiefly from glowing non-gaseous matter, whether solid or fluid—had but one-tenth of that brightness. The general inference arrived at by Mr. Proctor from the observations then recorded is that the gaseous matter which had been present in the corona of 1871 was either entirely absent or greatly reduced in quantity; that the particles of solid or liquid (but probably solid) matter which, by reflecting sunlight, produced a considerable portion of the corona's light in 1871, were glowing with heat in July 1878, and shone in the main with this inherent light; and that the entire corona was greatly reduced in size in July 1878, as compared with that which in December 1871 formed what was described as a star-like decoration around the body of the moon. It is not, however, to be confidently assumed that such a corona as was seen in 1871 invariably surrounds the sun in years of great disturbance, whilst the later one forms the typical corona for years of small solar disturbances. Such a generalization not only rests on evidence too scanty and imperfect, but is contradicted by many facts adduced by our author. The means of observation, too, are few and far between. In the case of the solar corona, we have not the power of systematic observation, as in that of the prominences, on every fine clear day. It is only on the rare occasion of a solar eclipse that the corona comes under view, and until some expedient of an alternative kind is devised, which Mr. Proctor is inclined, from considering the optical conditions of the problem, to regard as hopeless, we must wait in patience for the gradual clearing up of the mystery which shrouds the periodic changes of the sun's face.

The evidence for and against the discovery recently announced of one or more planets between Mercury and the sun is the subject of one of Mr. Proctor's most interesting essays. Less magnificent or imposing as it may appear than the discovery of Neptune, the detection of an intra-mercurial planet is, as he shows, in reality a problem of far greater difficulty. And even granting the fact of such a planet having been observed, the determination of its orbit presents all but insuperable difficulties. It is only when the sun is eclipsed that we can expect to see such a body under ordinary conditions of light and atmosphere. It was during the eclipse of July 1878 that the actual discovery was made public, though as early as March 26, 1859, Dr. Lescarbault declared that he had seen a small black spot traverse the sun's disk, and satisfied Leverrier of the fact of his discovery. Before this time Leverrier had occupied himself with the problem of the discrepancy between the observed motion of Mercury and the received elements of the planet. An increase in our estimate of the mass of Venus by a full tenth failed to resolve the problem, involving insurmountable difficulties in other directions. He was led to look for the disturbing cause in matter lying between the planet and the sun, whether in the form of one or more planets, or other more minute asteroids, or possibly mere cosmical dust. An intermediate planet half the size of Mercury would indeed account for the discrepancy between observation and theory. But such a body would be so conspicuous as to force itself upon the sight even without the sun being eclipsed, and during eclipses it would form a most resplendent orb. A ring of small planets seemed to the French astronomer a more probable hypothesis, and, following up this suggestion in accordance with that of Sir John Herschel, M. Faye urged the systematic photographing of the sun's disk at several observatories many times in the day. The actual transit announced by the half-taught village doctor was, after critical inquiry, recognized by M. Leverrier, who, from the crude observations presented to him, calculated for this new celestial body, thenceforth named Vulcan, a period of nineteen days seventeen hours, at a mean distance from the sun, as compared with that of the earth, of 147 to 1,000, the points of its orbit where it crosses the ecliptic being in a line with those occupied by the earth about April 3 and October 6. Estimating its mass at about one-seventeenth of that of Mercury, he inferred that this body was after all utterly incompetent to produce the observed change in the orbit of the larger planet.

Grave doubts have, however, since been thrown upon both the observations of Dr. Lescarbault and the calculations of M. Leverrier, though endorsed by Moigno and Hind. Mr. Proctor, who on the first announcement expressed himself as satisfied, on the whole, with its reality, has been led by more recent evidence greatly to modify, if not wholly to retract, his opinion. Discussing the bodies seen by Watson and Swift during the eclipse of July 1878, he sees nothing to identify either of these with the Vulcan of Dr. Lescarbault. Neither do their places agree with his calculated orbit, nor in point of apparent magnitude do they come at all up to what we should have expected. Other eclipse observers failed to discern any interplanetary bodies whatever. It seems at the same time probable, if not, Mr. Proctor thinks, certain, that such bodies are still to be detected by powerful telescopes, especially at the half-yearly periods when Mercury's path approaches most nearly that of the earth.

The past history of our moon gives scope for a very instructive summary of the most recent information touching the changes that have gone on in the condition or aspect of our satellite. Whilst modifying to some extent the views expressed by him in an earlier treatise on the subject, our author considers that they are confirmed, on the whole, by the results of the most recent observation and reasoning. What may be stated as the more general impression among scientific men is that the condition of the moon is one of extreme age or decrepitude, representing in that sense what the earth is likely to become at a remote future period, however different it may be in other respects, owing to its special physical constitution. If at any time the moon had an atmosphere and oceans, these have long since passed away, having, it is possible, been withdrawn into the interior of its mass. Should a like fate await our own aerial and watery envelopes, the earth's aspect would be that of wide, shallow basins bounded by rims of mountain chains, rather than that of huge craters and volcanic rifts, such as the moon presents to the telescope. Chemical convulsions must have taken place upon or within the moon of an intensity and variety to which the history of the earth exhibits no parallel. As the original incandescent gaseous mass cooled and shrank, condensation and solidification went on, first at the surface, the same process extending later on from the centre outwards. A semi-solid mass would thus be left between the two, corresponding, it is held by some, with the earthquake zone of the earth's interior. Bursting upwards at intervals, this plastic heated fluid would issue in the enormous radiating volcanic craters of which Tycho forms the typical, and perhaps the earliest, example. At other points the shrinking or corrugating action would give rise to those parallel rifts or fissures which form so characteristic a feature of the lunar surface. From the chemical changes going on under intense heat there would result the oxidation of all carbonaceous matter, the conversion of all carbonates, chlorides, and sulphates into silicates, and the separation of the carbon, chlorine, and sulphur in the form of acid gases, which, with nitrogen, watery vapour, and an excess of oxygen, would form an atmosphere of extreme density. The resulting fused mass would, according to the chemical theory of Dr. Sterry Hunt, contain all the bases as silicates, resembling in composition certain furnace slags or basic-volcanic glasses, much like our own primitive igneous rocks. Such is the aspect which the moon's visible face presents to us. How far it has been affected or may still be affected by innumerable meteoric bodies falling upon it, is a point of speculation in which Mr. Proctor goes beyond us. Nothing at all approaching to it is traceable in regard to the earth, which must be proportionally more exposed to such showers. It is in matters where the imagination finds extra scope that we generally find ourselves at issue with our author. In the present volume, however, we gladly observe a more sober tone of speculation than we have at other times noticed.

OMAR KHAYYÁM.*

THE translation by Mr. Fitzgerald of some of the Quatrains of Omar Khayyám, the astronomer-poet of Persia, was published anonymously, and at first utterly neglected by an unappreciative public. Presently, however, the great merit of the poems came to be known, and the book rapidly ran through three editions; we now welcome a new and enlarged reprint, which, together with the same translator's version of a poem by the celebrated Jámí, forms an elegant and most readable little volume.

Omar Khayyám, although himself leading a studious and uneventful life, was intimately connected with two very prominent figures in the history of the East. He was born at Nishapur in Khorassan, in the latter half of the twelfth century of the Christian era, and while a youth studied under the then renowned Imam Mowaffek, a native of the same town. Amongst his schoolfellows were two other lads of promise; and the three agreed that if any one of them rose to power or fortune he should share it with the other two. One of these lads became afterwards vizier to Alp Arslan and Melik Shah, son and grandson of Togul Beg, the founder of the Seljukian dynasty, and took the title of "Nizam ul Mulk," "Marshal of the Empire," by which he is known in history. The second was Hasan ibn Sabbáh, founder of the sect of the Assassins, who earned so terrible a reputation

* *Rubáiyát of Omar Khayyám and the Salámán and Absál of Jámí rendered into English Verse.* B. Quaritch. London. 1879.

among the Crusaders as the "Old Man of the Mountain"—a translation of his title "Sheikh el Jebel," which he took from his fortress of Alamut, a mountain south of the Caspian Sea. This man, an arch intriguer, had been advanced to power by his former schoolmate, requited his kindness with gross ingratitude, and at last caused him to be treacherously murdered. Omar Khayyám, when Nizam ul Mulk attained his high station, also came to claim fulfilment of the compact made between them in childhood; but, avoiding the dangerous ground of office and Court intrigues, asked only for a pension which should enable him to devote himself undisturbed to the pursuit of science. *Khayyám*, his *takhallus* or *nom de plume*, signifies a "tent-maker," which trade he is said to have exercised during the early part of his career, and to which he whimsically alludes in the following lines:—

> Khayyám, who stitched the tents of science,
> Has fallen in grief's furnace and suddenly been burned.
> The shears of Fate have cut the tent rope of his life,
> And the broker of Hope has sold him for nothing.

It is the fashion with the native Persian critical schools to regard Omar as a true Sufi, and M. Nicolas, the French editor and translator of a large portion of his quatrains, inclines to the same opinion; but not only is it obvious that the poet throws off the disguise of mystical philosophy under which the Sufis hide their heretical opinions, and expresses himself with a frankness that is found in no other Oriental poet, unless it be the Arabic Abu l'Ola, but it is a matter of history that he incurred the open hostility of the sect for his freethinking and for his exposure of their hypocrisy. The Sufis profess almost pure Pantheism, but hide it under the outward garb of Islam; while Omar el Khayyám's creed is much nearer akin to atheism. His frame of mind is well indicated by the translator in the concluding words of his preface:—

> Those [quatrains] here selected are strung into something of an Eclogue, with perhaps a less than equal proportion of the "Drink and make merry," which (genuine or not) recurs over frequently in the original. Either way the result is sad enough; saddest perhaps when most ostentatiously merry; more apt to move sorrow than anger towards the old Tentmaker, who, after vainly endeavouring to unshackle his Steps from Destiny, and to catch some authentic Glimpse of To-morrow, fell back upon To-day (which has outlasted so many To-morrows!) as the only Ground he got to stand upon, however momentarily slipping from under his feet.

The versification of the renderings here given is smooth and suitable to the subject; but it does not in the least represent, as is suggested in the introduction, the *movement* of the original Persian stanza. This is a common fault of European translators, who are dependent on the scansion, the technical analysis of the metres of Persian and Arabic prosody, for their knowledge of the rhythm, and seldom, if ever, attain that feeling which enables a native at once to put the proper rhythm, we might almost say the proper tune, to every verse. M. Stanislas Guyard's *Métrique Arabe*—a book which we reviewed in this journal on its appearance—is the only work which supplies this deficiency, and should be in the hands of every one who aims at rendering Oriental poetry in verse. We do not advocate a servile imitation of the metres, which would, indeed, be impossible in many cases; but the movement of the verse may nearly always be imitated with good effect. The arrangement of the original poems in this volume being merely alphabetical, the translator has much enhanced the interest of his selections by placing them in something like a connected sequence of thoughts.

Like his Sufiistic *confrères*, Omar's verses are full of references to the wine-tavern, allusions which are often allegorical, it is true, but which are quite innocent of mysticism. Here is one:—

> Before the Phantom of False Morning* died
> Methought a voice within the tavern cried,
> "When all the Temple is prepared within,
> "Why nods the drowsy worshipper outside?"
> And as the Cock crew, those who stood before
> The tavern shouted—"Open then the Door!
> You know how little time we have to stay,
> And once departed may return no more."

And this theme, "Let us eat and drink, for to-morrow we die," is ever the refrain of the poet's song:—

> Ah, make the most of what we yet may spend
> Before we too into the dust descend;
> Dust into dust, and under dust to lie,
> Sans wine, sans song, sans singer and—sans End.

His contempt for the unsubstantial pleasures of glory and ambition, which he practically illustrated in his life, finds also constant expression in his poetry, always in some terse cynical epigram:—

> Some for the Glories of this World; and some
> Sigh for the Prophet's Paradise to come.
> Ah! take the Cash and let the Credit go,
> Nor heed the rumble of a distant Drum!

But though disbelieving in the future joys of Paradise, the fate of the Dust, when it has returned to dust, has always a mournful interest for him, and the yearning for immortality which seems so natural to the human soul, is perforce with Omar contented with discerning in the productions of the earth some reminiscence of those that lie beneath it:—

> I sometimes think that never blows so Red
> The Rose as where some buried Cæsar bled;
> That every hyacinth the Garden wears
> Dropt in her Lap from some once lovely head.

* The *Subh i Kazib*, or False Dawn, a phenomenon well known in the East, where the first appearance of the morning light is followed by an interval of darkness before the rising of the true dawn.

The Oriental poets always compare the dark locks of a lovely damsel to a hyacinth.

Occasionally in his mournful meditation over the past and gone he utters a note of true elegiac poetry:—

> For some we loved, the loveliest and the best
> That from his Vintage rolling Time hath pressed,
> Have drunk their cup a round or two before,
> And one by one crept silently to rest.

His schooling under the great saint El Mowaffek did not resolve his doubts, and left him searching as eagerly and as blindly as ever about the unknowable:—

> Myself when young did eagerly frequent
> Doctor and Saint, and heard great argument
> About it and about; but evermore
> Came out by the same door wherein I went.
>
> With them the seed of Wisdom did I sow,
> And with my own hand sought to make it grow;
> And this was all the Harvest that I reap'd—
> "I came like Water, and like Wind I go."

To a Mohammedan ear the last line sounds full of the deepest poetic meaning. The Coran—the Word of God—says, "We created man out of a drop of water," and to "go to the winds" means, as with us, to be wasted, lost, and dissipated. Half disbelieving, yet half infected with the deistic fatalism of the Islam in which he was brought up, he looks upon mankind as the mere sport of a hypothetical Fate:—

> But helpless Pieces of the Game He plays
> Upon this chequer board of Nights and Days;
> Hither and hither moves and checks and slays,
> And one by one back in the closet lays.
>
> The Ball no question makes of Ayes and Noes,
> But Here and There as strikes the Player goes.
> And He that toss'd you down into the field
> He knows about it all—He knows—He knows.

His aspirations and wishes are summed up in one of his own verses:—

> Ah, Love! could you and I with Him conspire
> To grasp this sorry Scheme of Things entire,
> Would not we shatter it to bits—and then
> Remould it nearer to the Heart's desire!

The next poem in the volume—"Salámán and Absál"—is by Jámí, an enthusiastic and learned Persian of the fifteenth century, who spent his life in trying to become a philosopher, and became a poet instead. It is an allegory of Sufiistic doctrine; and the story, slender enough in itself, is interrupted at every turn by anecdotes and other digressions, which are frequently of a grotesque and comic character. Thus the preliminary Invocation to the Deity, after setting forth the theme of which Persian mystics never tire, that mortal beauty is but a veil behind which the heavenly hides, and that in the contemplation of God all consciousness of Self is lost, proceeds:—

> Do Thou my separate and divided Self
> Make one with thy Essential! Leave me room
> On that Divan which leaves no room for twain,
> Lest, like the simple Arab in the tale,
> I grow perplext, oh God! 'twixt "ME" and "Thee";
> If I—this Spirit that inspires me whence?
> If THOU—then what this sensual Impotence?

The story of the "Simple Arab" is then given. A Bodawi comes from the desert to Baghdad, and is afraid that, if he goes to sleep amidst all the crowd and confusion, he will not know himself in the morning. To make matters certain, he tied a gourd round his ankle; but a wag slipped it off while he slept, and fastened it to his own foot. On waking he—

> Cries aloud, "Oh Good-for-nothing
> Rascal to perplex me so!
> That by you I am bewildered
> Whether I be I or no!
> If *I*—the Pumpkin why on YOU?
> If YOU—then where am I and WHO?

Jámí was advanced in years when he wrote this poem, and one passage in which he refers to his failing bodily powers and his approaching end is in striking contrast to this mystical fooling:—

> I bow down to my root, and like a child
> Yearn, as is likely, to my Mother Earth,
> Upon whose bosom I shall cease to weep,
> And on my Mother's bosom fall asleep.

The story tells how a great king had a son miraculously born to him, who fell in love with his nurse, and fled from the palace with her. The king and his vizier, a sage, succeed by a mesmeric exercise of the Will in dispelling his infatuation, and recalling him to the duties of his position. The girl of course dies; and the sage, to blot out her memory more completely, shows him a phantom of his beloved, and at last reveals Zuhra, or Venus, as the pure Celestial Beauty, of which the earthly Absál was but a type. Jámí's poem is interesting, as it epitomizes the mystic doctrines of Sufiism, and it certainly contains some fine passages; but it lacks the vigour and depth of Omar Khayyám's verses. We understand that a German scholar has in hand a complete translation of the *Rubáiyát*; this will be very acceptable to the many readers whom Mr. Fitzgerald's selections have made familiar with the old Persian freethinking poet.

FROM GENERATION TO GENERATION.*

LADY AUGUSTA NOEL'S last novel, *Owen Gwynne's Great Work*, was, we think, one of the best of its year. It was written in excellent English, and with a sympathetic knowledge of human nature which does not permit it to be forgotten. Her new story, *From Generation to Generation*, is even an improvement on *Owen Gwynne*, at least in loftiness of aim and excellence of intention. The situations are more powerful, the characters more numerous and varied; the somewhat pensive tone is relieved by a conclusion happier than could have been hoped for, and the "environment" of the story, the Highland scenes and Highland homes, are painted with a very delicate touch. We do not precisely mean to say that *From Generation to Generation* is a great original work. The chief characters, the characters on whose action the story turns, are, as usual, not very distinct. We have here a noble and unfortunate youth, and a youth by no means noble, and more fortunate than he deserves to be. These are matched, of course, by the two young women suited to their character and position. They get through the "business" very well, and perform their parts in a praiseworthy kind of way; but the men and one of the women do not exactly live—they rather fall short of being actual people. It seems almost impossible even for men of genius so great and so diverse as were Scott, Dickens, and Thackeray to make heroes and heroines living beings. Heroes have their work cut out for them by the necessities of fiction, and so have villains. There are certain stated things that they must do, and how can they help falling into routine? Lady Augusta Noel's hero, Ronald Douglas, has to suffer under a false accusation, to be a little wild, to make love, and to have his character cleared. Her weak young man, Kenneth Douglas, has to commit the offence of which the punishment falls on the hero, has to confess, make love, and prove, after all, a better fellow than might have been expected. These things are necessary and inevitable, and we do not think of blaming the author because her puppets are puppets. It is in the other characters that she shines, in the description of certain moods and attitudes of mind by no means hackneyed, and in the picture of Highland life as it is, not as it is seen by tourists from the deck of the *Iona*, or by yachting Cockneys among "the Scotch Hebrides."

It is somewhat remarkable that Scott never chose to describe in a novel that pathetic phase of Scotch life which followed the final decay of many of the great houses. In a passage in *The Tales of a Grandfather* he speaks of the Highland emigrants pouring down from their glens to the sea, while the mountains echoed for the last time to the pibroch and to the air "We return, we return, we return no more." Here is a sketch of a scene then familiar, as drawn by Lady Augusta Noel:—

> The hut was silent and deserted; no children were playing round the door, no sheep-dog's bark was heard in welcome or in warning. On the hearth in the middle of the floor were the dying peats of a fast fading fire—a heap of ashes—a faint canopy of smoke.
>
> The door stood wide open, and the wind swept into the empty dwelling with a sigh, fluttering the bit of checked blue and white curtain that hung above the window, and shaking the rude latch of the closed door that led "ben." A broken birdcage hung in the unglazed window, but its door was open too, and the bird was gone. It was a dark and dreary-looking hut enough, but once it was a home.

Sheep took the place of men in the Highlands, and the acres of many of the old families were sold, till only the park remained round the ancestral house. There is something very sad in the quiet air of some ancient fortress, set on its hill above the loch and the river, where so many fires once burned and so many clansmen gathered; a thin smoke steals up from a single chimney, and two or three old ladies represent a family as ancient as the Stuarts. Lady Augusta Noel has chosen for the scene of her story a castle less forlorn than many that still survive, and for her characters the members of a family somewhat fallen from their old fortunes, but not impoverished. The house of Dalbraith in this tale is in the possession of a Lord Douglas, who has a beautiful wife, a promising heir, and a small colony of Scotch kinsfolk settled near him. Among these, a certain old Lady Beatrix Stuart has a romance which goes back into Jacobite memories; and there are a Colonel Douglas and a Cousin Grizel, whose chief pleasure is to recount the old stories of Stuarts, Douglases, the French kindred of the family, the ghosts, and the prophecies. All the early part of the novel (which is perhaps the most pleasant) is occupied with these sketches of a Scotch interior. Perhaps the "generations" which give the story its title are a little confusing. All readers have not the memory and the genealogical tastes of Miss Grizel Douglas, an old maid with a kind heart, an unlucky tongue, and a constant desire to begin every narrative "further back" than her friends enjoy. We cannot vie with Grizel, and must skip a few of the generations about which she is garrulous—all of them, in fact, between 1688 and 1840, or thereabouts. At that time Lord Douglas and his wife, a woman with more beauty than softness of nature, with their son Ronald, their cousin Colonel Douglas, his son Kenneth, and another cousin, a little girl named Marion Stuart, sent home to Scotland from India, make up the chief actors in the story. A good deal of space is devoted to the childhood of the three young people. Ronald is a very fine and fearless boy; as for Kenneth and Marion, the following quotation exhibits them in the attitudes in which they remain all through the novel. Kenneth is always in a scrape, always makes Marion his confidante, and never can go straight unless she is there to back him. The severity of his upright and honourable father has made him a moral coward. All this comes out in a childish escapade:—

> It came about in this way. The portrait (in pastels) of "Euphemia Douglas, Spinster, *ætat* 45," had long possessed an unholy fascination for him; and a certain large pink rose, stuck primly in her blue stomacher, appeared in his eyes the most desirable target which any marksman could aspire to.
>
> One day when, most unluckily for him, his father was sitting in the drawing-room, talking to Lady Beatrix, the deed was done, and an arrow, discharged with somewhat nervous haste from outside the window, found its mark (but fortunately half spent) in Granny's prettiest lace cap.
>
> It took only two of Colonel Douglas's long strides to carry him to the spot, and the hapless archer was captured red-handed, the bow still grasped quivering in his arms.
>
> Kenneth had never encountered anything so formidable as his father's bent brows, low voice, and the fierce grasp that fastened on his shoulder like a vice. Lady Beatrix had been in real peril for an instant, and her nephew was sufficiently frightened to be very angry.
>
> "That was your doing I suppose, sir," he said in a deep and shaky voice.
>
> The boy faltered for a moment and looked round for Marion, who, as usual, in the hour of danger, was quickly at his side. That instant's hesitation sealed his fate.
>
> The sentence, quickly pronounced and irrevocable, was imprisonment at Norman's Tower until such time as his father's leave was over, and then a school in England.

With these dispositions Kenneth, when he is older, is just the lad to fulfil the "Doom of Dalbraith," the prophecy which is an heirloom in every respectable Highland family. The Seaforth prophecy about the "white-hooded lassie from the East" is well known, and its fulfilment has hitherto been remarkable. Lady Augusta Noel has not disdained to borrow part of the "Doom of Dalbraith" from the utterance of the warlock whose portrait still hangs, or lately did hang, in the hall of Brahan Castle:—

> "What is it about?" asked Harold. "May one hear it?"
>
> "Oh, it's very oracular," said Douglas; "in Gaelic especially, it does not sound nearly so well in English. I have forgotten half of it, but the end is something like this—'When kinsman's hand is dyed with kinsman's blood,—when true is false, and the loving heart grows cold—then the one son of the good father shall cross his threshold for the last time, unless there comes a lassie from the East, who can wash the red hand white.'"

Now, having got our prophecy, it becomes plain that the story is to turn on its fulfilment. And we must say that it is fulfilled in a moral sense which the Highland seer could never have contemplated. Moreover, it is the great blot on the construction of the story that "kinsman's hand" could not have well been "dyed with kinsman's blood" in the way here narrated. That, at least, is our decided opinion, which readers accustomed to Highland sports may confirm or reject for themselves. The problem before the author was this—she had to make Kenneth Douglas fulfil the prophecy by inadvertently slaying Lord Douglas. Out of his moral cowardice, and to "spare his father," he was to keep his action secret, and leave the horror of it on the head of poor Ronald Douglas, who was to seem to have "bagged his Governor," as the undergraduate said. Finally, the "lassie from the East"—that is to say, Marion, the little cousin sent home from India—was to make Kenneth confess his accidental guilt, and so "wash the red hand white." It may be permitted to guess that the prophecy, modified from the Seaforth prediction, suggested the plot, and we regret that more pains have not been taken to make the plot possible.

Everything turns on this simple question—Is the blackcock a bird which lives in woods, like the pheasant, and is there shot much as pheasants are? Lady Augusta Noel makes her sportsman shoot the early August blackcock in such thick covert that when Ronald and Kenneth fire both at once, the latter shoots Lord Douglas without seeing him. Now this is not an impossible thing to do; but it would have been better, perhaps, if the writer had given a clearer description of the exact circumstances. As it is, the incident is a little puzzling. No one knows who fired the shot except one Adam Haldane, the servant of Kenneth's father. He promptly throws the blame on Ronald, and, though he tells Kenneth the facts, the blame is allowed to rest on Ronald's shoulders till the conclusion of the story. Kenneth, as usual, tells all to Marion; but she cannot make him confess, and thus arises the repulsion between Ronald and his mother which drives him into reckless living. The knot thus fastened has to be untied, and is complicated by two love stories. Ronald is betrothed to Marion, who loves Kenneth in spite of his cowardice, but who imagines that she may be of service to Ronald. That arrangement is unsatisfactory; and Ronald, after years of wandering and of dissipation, transfers his affections to a French cousin, Diane de Beaurepaire, though even here his love is thwarted by a sense of his voluntary and involuntary guilt.

The most powerful part of the novel is to be found in the scenes between Ronald and his mother. She cannot forgive him. She is forced, in spite of herself, to be cruel to him, and to drive him from her presence. This produces some very strong situations, of a somewhat novel interest. Meanwhile remorse does not interfere much with Kenneth's enjoyment, and he even induces old Haldane to make no confession on his death-bed. We have been obliged to tell more of the story than it is quite fair to reveal, and we must not disclose the series of events which ultimately "wash the red hand white."

Readers of *From Generation to Generation* will perhaps vary in opinion as to whether the author has succeeded in the task she set herself—in the portrait of a noble nature partly defaced and almost crushed by the burden of another's guilt. That she

* *From Generation to Generation.* By Lady Augusta Noel. 2 vols. London: Macmillan & Co.

has produced a story of unusual interest and of lofty aim is undeniable. "In great attempts," the Latin tag says, "to have meant well is enough." Here the aim has been very high, even if the success is incomplete. It must be added that some passages of humour are admirable; for example, the study of child life, which is too long to quote (vol. i. chapter V.), and this reproduction of the talk of Norfolk peasants, "whose oddity consists . . . . in the reckless bringing together of all the words the speaker least understands":—

Mary was flitting busily from one house to another. They found her standing by the bed of a sick young man.

"Yes, my Lady, he fare to lay so long," said the mother, outspoken and solemn, but not unkindly. "'Tis a dispense, but we must put up with him."

Margaret asked if he had seen the doctor. Yes; William had got his two bottles of physic as 't were 'propriate.

"The tu medicines don't fare to corroborate together," observed his mother, "but my son he ha' condescended to both. He don't get no strength, Miss Mary, for he have no perceivius for eating, and that's where 'tis."

"I fare," interrupted the invalid, languidly, "as though I could pick a mite o' rabbit."

"Lawk, a rabbit!" continued his mother; "his mind du seem wonderful set on a rabbit. 'Mother,' he says to me last night, at half-past ten o'clock, or t'might be on the stroke of 'leven, 'Mother,' he sa', quite as I might be speaking now, 'if so be as I could happen of a rabbit, I du think,' says he, 'he would put a tiddy bit of life into my dear inside.' and"—very slowly—"I *du* believe, Miss Mary, as 'twould."

THE CHIEFS OF CENTRAL INDIA.*

WHEN Richie Moniplies was admitted into the private chamber of King James I., bringing with him the carcanet of rubies that had been "opignerated" to George Heriot, he described His Most Sacred Majesty's ante-room as an "ill redd-up" apartment. We must apply this uncomplimentary epithet to this introductory volume, the precursor of how many more we know not. The author has been placed in a position where he can obtain the accurate information indispensable to Indian writers who aspire to become standard authorities. He has had access to public documents. As the head of a sort of Indian Eton, he must be familiar with the temptations and proclivities of the scions of great Hindu and Mohammedan houses, and of the difficulty of educating them up to the level of their responsibilities. One of Lord Mayo's earliest dreams was the possible conversion of listless puppets, debauched *porphyrogeniti*, and intriguing and cunning despots, into intelligent rulers of their own subjects and loyal feudatories of the Crown. This idea was carried out after Lord Mayo's death, and we naturally look for some interesting details about the Rajkumar or Princes' College. We should have liked to know something more than the bare fact that the young chiefs of Malwa learn political economy, are drilled twice every week, and play at Polo; while the excellent series of photographs given of the students at this institution provokes a desire to hear something more definite about the union of study with athletics. Without betraying confidence or telling us that one Thākur was pot-bellied or a certain Nawab pig-eyed, Mr. Aberigh-Mackay might have told us something of the discipline, the regulations, and the physical and moral training of his pupils. It would be satisfactory, for instance, to know how these young Rajas take to cricket and horsemanship, and whether they can handle the rifle as well as the pen; and an account of a cricket-match in which the young chief of Rutlam had hit a fiver to the on, or the Nawab Bahadur of Banda had stumped Jivaji Rāo Puar off a leg-shooter, would be far preferable to the diffuse rules about railway police and the repetitions of well-known treaties by which the pages are swelled. The arrangement of materials strikes us as very defective and awkward. There are two hundred pages numbered by Roman letters, on the pretext that the matter is introductory, and then in the middle of the volume we start afresh by reckoning with ordinary numerals for the House of Holkar. It seems never to have occurred to the compiler that there must be some beginning to every work, and that for purposes of reference it is exceedingly inconvenient to have to quote p. ccxiv and p. 214 out of the same volume. Then alarming tables of statistics are thrust in anywhere. An appendix, with an index, cuts the work into two parts. Treaties which every one at all familiar with Anglo-Indian history can find in Mr. Aitchison's admirable series and in other books, are given at full length; and at p. 150 *et seq.* the author descends to the level of the most trumpery Court journal, and relieves dry statistics of cotton-mills and carding-engines, which do possess some value, by all the tedious and oft-told ceremonial of Lord Northbrook's visit to Indore in November 1875. We learn for the hundredth time how the Second Assistant to the Governor-General's Agent met the Maharaja at the "usual point," and how the First Assistant conducted him to the top of the staircase; what dignitaries sat in what carriages; and who distributed those odorous and savoury accompaniments of all *durbars*—*uttr* and *pān*. This is mere fashionable twaddle. Again, it is very gratifying to learn, on unimpeachable authority, that order reigns in Central India; that fruitful plains are no longer harried by swarms of Mahratta horsemen and Pindarry raiders; that peaceful travellers are not strangled by Thugs, nor respectable householders roused at midnight by bands of ruffians with whitened faces and flaring torches. But it is sheer pedantry to make "the great pulse of commerce beat with an invigorated systole and diastole." We sincerely hope that this is not the sort of English composition which the young chiefs and princes are taught to admire and imitate. And how elegant is the metaphor which tells us that in Central India a "great complaint is always steaming up about the dearness of food grains"? Yet, when we can get over the unmethodical arrangement, the trivial incidents, the accumulation of second-hand learning, the lists of transient and obscure functionaries—Englishmen and natives—and the gaps in the information which we had a full right to expect from a person with exceptional advantages, there is a good deal to be picked out from several chapters. But with every desire to give prominence to the worthier portions of this bulky volume, we cannot say that it ever rises to the level of one of those yearly Reports which the Foreign Office at Calcutta still receives from the representatives of the Viceroy at Mount Aboo, Indore, Gwalior, or Mysore.

From one of these very Reports which we have compared with the author's compilation, we can give a condensed sketch of that part of the British Empire which is termed Central India. This title properly includes three great divisions of native States. The first and most northerly is the territory of Scindia, with his feudatories. The second is represented by the Bundelcund chieftains, of whom Rewa is the principal. The third includes Malwa and the land stretching southwards across the Narbudda River to the Satpoora Range. In all there are no less than seventy-one native States, large or small, covering an area of 83,600 miles, with a population of at least eight millions, and a revenue of nearly three millions. The two latter items must be accepted with the caution inevitable where native agents supply facts and figures about the revenues of princes of their own creed and colour. But the whole tract is such as to furnish facts for the politician, ruins for the antiquary, traditions for the poet, adventures for the sportsman and the naturalist. Some of the jungles and defiles are only now and then penetrated by a staff officer on a shooting tour, or by a geologist undeterred by fever and in search of undeveloped mineral treasures. Many of the ruins have been photographed of late years, but their dates and inscriptions are still the subject of heated discussion. The reader will bear in mind that Central India—or, more properly, the native States comprised within the Central Indian Agency—has nothing to do with the Central Provinces, which have been for the last quarter of a century an integral part of the British dominion. But the congeries of native States over which the Agent to the Governor-General presides afford an admirable instance of the working of that doctrine of the Paramount Power which some years since appeared utterly beyond the ken or comprehension of Mr. Gladstone. It may be almost said that, barring annexation which has gone out of fashion, there is hardly anything in the foreign or internal policy of these princes to which the interference of the British Government may not at times extend. It is true that we do not interfere with the ordinary assessment or collection of the revenue, and that we allow most native rulers to punish their own criminals and to provide for the security of life and property within their own dominions. But there are scores of matters in which something more is needed than vague hopes and admonitions to be good, or remonstrances never backed by a vigorous show of authority. The larger States must be kept to their agreements, and the weaker chiefships protected against gradual absorption. Boundary disputes are endless, and have actually to be provided for in a code of their own, of which several interesting samples are given in page ccv. and following, showing how representatives from each State must attend before the Boundary Commissioner, who is generally a rising staff officer in political employment. Every now and then a State is threatened with bankruptcy through the extravagance and recklessness of two or three owners in succession, or the subjects, worn out past endurance, besiege their sovereign in his palace; and the principality must be taken under British management until the next heir, a minor, can be hunted up and taught the very rudiments of equitable administration. Then there are bands of Dacoits to be run down, or oppressive and unjust taxes to be given up, or land has to be taken for a railroad, or the dismissal of a corrupt Minister is imperatively called for, or money must be freely disbursed under proper supervision and safeguard to mitigate a famine and to prevent the spread of an epidemic. If any copious orator should imagine that such desirable ends can be attained without the watchful and firm interposition of a set of picked and highly trained English officials, or that "free institutions," with civilization and order, will grow, like Topsy, spontaneously amongst the representatives of Mahratta and Mahommedan freebooters, a perusal of some of the author's pages might soon undeceive him.

Nothing can be more instructive as regards one effect of our rule in Central India, than the author's account of the rise and progress of Holkar's family. His claims on the score of antiquity, hereditary occupancy, or those paternal and mild attributes with which many writers invest imaginary native chiefs, are absolutely nil. It is not yet two centuries since Mulhar Rāo rose from the occupation of a goatherd to command a troop of horse, to serve under the Peshwa, to fight against the Afghans, and to seize on large domains. Nor have his descendants been deficient in military or administrative talent. Ahalya Bāi is perhaps a unique example in Indian history of a woman who ruled over a native

* *The Chiefs of Central India.* By G. Aberigh-Mackay, Principal Residency (Rajkumar) College, Indore, Central India. Vol. I. Calcutta: Thacker, Spink, & Co. London: W. Thacker & Co. 1879.

population with unquestionable ability and unsullied character. In spite of the restraints of the Zenana and the want of regular education, every now and then there rise to the top dancing girls, Court favourites, slaves, who command armies, dictate a policy, discomfit rivals, and share a throne. But such women have too often been utterly unscrupulous, vindictive, and profligate. Ahalya Bái was pure in conduct, an ascetic in all sensuous enjoyments, fervent in devotion, and earnest in her endeavours to promote the welfare of all her subjects. Sir John Malcolm, who had conversed with those who had known this high-minded lady, justly pronounces her "one of the purest and most exemplary rulers that ever existed." Mr. Aberigh-Mackay, who is fond of quoting poetry, does not seem to be aware that Ahalya Bái is the subject of a rather pretty poem by Joanna Baillie. In striking contrast to this noble Queen is the one-eyed Jeswunt Rāo, who is mainly remembered in India by the jingling couplet which describes the disorderly retreat of the incapable Colonel Monson. Such excellent authorities as Lord Lake, Mr. Grant-Duff the father of the member for the Elgin-Burghs, and the Duke of Wellington, bear a testimony to his capacity as an active and daring soldier that cannot be doubted. But the glimpses of Mahratta statesmanship afforded us in his biography are unpleasantly suggestive. That there should be no judicial system amongst the Mahrattas, nor the shadow of an authority to repress the strong and keep the weak alive, is perhaps not miraculous. But there was not even any attempt to place the revenue administration on the footing for which, in theory at least, Hindu Rajas and Mussulman Viceroys have always contended. Every district was plundered by detachments of soldiery commanded by officers who were despatched yearly with this avowed object. Taxation became a scramble for "loot" by a horde of cavalry. Jeswunt himself on one occasion horrified his Hindu followers by plundering one of their rich shrines. During this time the army was never paid, and the Ministers and officials at Court resembled the rabble in *Comus*. It is, of course, no very striking merit of English statesmen that they do not allow Rajas to act on Mahratta precedents; but when it is asked what we have done for India, it is occasionally worth while to look back on what was done or not done before we stepped in to scare away the demons of plunder, and to reflect how all native statesmanship might collapse if our hand were suddenly to be withdrawn. A letter from Lord Hardinge, dated November 1844, explaining the active part which the British Government then took on a vacancy in the succession, is noteworthy. It is sometimes thought that Lord Dalhousie invented the doctrine of high-handed interference with Oriental maladministration. What he really did was to act on precedents created by Hastings and Wellesley, and to apply and expound them with a force and precision "rarely equalled in the annals of statesmanship."

The author has some significant remarks which ought to charm Mr. Bright, on the entire absence of any aristocracy in the Mahratta States of Central India. This is what might be expected where the great-great-grandfathers of the rulers themselves were freebooters, troopers, or herdsmen. Menial servants now rise to the highest positions in the State, and offices have a tendency to become hereditary. A few Brahmans from the Deccan, Mr. Mackay tells us, form the Court, and the relations between a Maharaja and his domestic servants are of an intimate and confidential character which Englishmen find it difficult to comprehend. In these days, when the employment of more natives in judicial and executive posts in British India is advocated on political and financial grounds, it is not uninstructive to mark the scale of salaries assigned by Holkar to Ministers, secretaries, treasurers, military officers, and judges. A Prime Minister gets 2,400*l.* a year; a first or chief Judge, 960*l.*; a Secretary, 600*l.*; and a Colonel of Infantry, 390*l.* All this sounds moderate enough, but Mr. Mackay must surely be well aware that natives so remunerated enjoy other means of enhancing their income, providing for their endless relations, and amassing wealth, and that they look to these informal gains quite as much as to their monthly salaries. The schedules given in the book show that some high posts descend from father to son or nephew; and it has been found indispensable, with us, to pay to a native judge of a Court of Small Causes, answering to English County Courts and something besides, a larger salary than is drawn by a judge of what is apparently a Court of Appeal at Indore. We are glad to find that in the scale of Holkar's expenditure a certain sum is set down for pensions—a form of remuneration for past services unknown before our time. The current term for a pension amongst the sepoys of native regiments used to be, and probably is still, "Inglis," derived from the only race in India that did not leave its worn-out servants to die of sheer inanition. The mention of salaries and pensions leads naturally to the mint which coins the money to pay them. The right to coin money has long been cherished by native rulers, and any attempts to induce them to forego this privilege, and to accept the mintage of Bombay or Calcutta, have been failures. The description given in one of the appendices of the process of coining at Indore is amusing. The materials and implements are not very different from those of an ordinary goldsmith brought out of the bazaar to make a bangle of a peculiar pattern, on which the wife of the English judge or magistrate has set her heart. Troughs of clay, pipes of the same stuff, an anvil, a hand-bellows, a steel die, a decoction of tamarinds to prevent permanent discolouration of the metal, and a heavy hammer, make up the stock in trade. We are glad to learn that "the purity and weight of the coin have been fairly maintained," notwithstanding imperfect superintendence and obvious temptations to fraud; nor are we surprised to find that some elaborate machinery and dies brought from England in 1861, for a new mint to be worked by steam, were tried once and then abandoned. Natives are intensely economical and conservative; and, though pleased with scientific toys for a day or two, rarely can be brought to comprehend that new processes, to be productive, must be preceded by a liberal outlay. Offences against the coinage are frequent, and extend from the coining of base metal to clipping, sweating, and boring; and these evils are so far recognized that bankers and traders are allowed to introduce three counterfeit rupees into every bag of 500 or 1,000 rs., "ostensibly to compensate for the cost of cloth and sealing-wax." It is not matter for surprise if the limit of three becomes elastic and sometimes extends to twenty.

The subject of Thuggee has such strange fascinations, and presents such extraordinary contrasts between outward decorum and the complete annihilation of all moral sense, that we cannot blame the author for his account of the means taken to discover, punish, and reform the perpetrators of this horrible crime. Those who derive their knowledge of it from Meadows Taylor's well-known work will find all that excellent writer's descriptions fully borne out in this volume. The horrible tradition of the origin of Thuggee, the curious ceremonies of initiation, the division of omens drawn from animals into good and bad, the tenderness to the victim, the devout prayers to Bhawani, the callousness to life, and the accurate recollections of exploits which had for their scene Central India, the Punjab, the North-West Provinces, and even Lower Bengal, are truthfully told but have no immediate connexion with the main purpose of the book. We should suggest, in parting with the author, that he should pay more attention in future to the disposal and sifting of his materials, and endeavour to separate information likely to attract the general reader from statistics which are almost too dull or ponderous for a Report of the Sudder Board of Revenue. Some knowledge of the despised trade of book-making would here do no harm. We regret to perceive that Indian journals are discussing a proposal, said to be seriously contemplated by the Government of India, for doubling up the Central India Agency with that of Rajputana. Conceived ostensibly on the score of economy, it would, we think, politically be unsound, costly, and extravagant. We might even predict that, if these two vast and important agencies were united by Lord Lytton, it would become necessary in the course of a dozen years to separate them again. And then, not for the first time, would the Indian Government be exhibited in the light of a conjuror performing the notable feat of turning six into half-a-dozen and half-a-dozen back again into six.

NEW SCHOOL-BOOKS.*

AFTER years of writing and talking on the subject by those who have found out that truth is the only sound foundation for teaching, and that it cannot do even young people good to "believe a lie," the world has been in part brought round to think so too. We say "in part" only, because here we have a batch of newly-published school-books, all except one by schoolmasters, which prove that some of those most concerned in the work of teaching, scorning this new-fangled notion as Mr. Pummel did the rules of spelling, "nowise give in to it" themselves. It has been pointed out so often that it seems like waste of words to repeat it, that grammar cannot be taught without philology. Yet here we find schoolmasters and professors going on writing and publishing books in which speech is treated as a mere wilderness of words, and grammar as the clue that guides the wanderer through the windings of the maze. Within the last half-dozen years there has been a very marked improvement in the quality of elementary school-books. Thanks to the several series of Primers for which our lions, literary and scientific, have condescended to stand sponsors, sound and scientific expositions of the first principles of almost every art or science are placed within the reach of every one who can read and has a shilling to spare. And in this general awakening among the dry bones of lesson-books, those which treat of our language and history have shown themselves even more lively than their fellows. On these neverfailing themes the changes have been rung in every possible key. They have been written about and lectured about so much and so often that every schoolboy is now expected to know just as much about the kings of the English who reigned before the Norman Conquest as he does about those that came after it, and to find himself more at home in the language of Longland and Chaucer than he is in the pompous polysyllables of Johnson or the polished cadences of Pope. Such being the case, it is somewhat surprising to find

a Regius Professor of English Literature and Modern History publishing *A Short English Grammar*, intended, as the title-page sets forth, "for the use of schools," wherein, looking no further than the second page, we find that German is the "mother language of English," to which it is added (p. 10) that the coming of the English was the conquest by German tribes of "that part of Britain which is now called England." We suppose that Mr. Yonge uses the word German as an equivalent for Teutonic; but the use of a term which is now universally applied exclusively to the modern "Hoch Deutsch" can only be productive of confusion in the minds of schoolboys, who have to take their teachers at their word without overmuch sifting of what their words may possibly mean. Not a hint is given to explain how it came about that the part of Britain which these said "German tribes" conquered got the name of England, or how their speech was, and is, called English. Nor, it would seem, is Mr. Yonge himself by any means convinced that it was so called, for he tells us that "it is as a Saxon scholar that Alfred *was* celebrated." Surely such a sentence ought not to be found in an English grammar, save as an example of a blunder to be corrected by the pupils. Even from old-fashioned Lindley Murray they would have learnt better than to make such a jumble of their tenses. But, though Mr. Yonge is thus careful to call the tongue of Alfred Saxon, and to explain that these German tribes "introduced the German grammar," by the time he gets to his fifteenth page he declares that in his "preceding pages the language has been always called the English language, out of deference to certain writers on the subject." He then goes on to explain away what he has not done by declaring that English

> is, comparatively speaking, a new title as applied to the language as it existed through the reigns of the Saxon, Danish, and Norman kings, and even of the earlier Plantagenet sovereigns. The more general appellation given till lately to the language which prevailed, at least to the time of the Confessor, was *Anglo-Saxon*, which those scholars who pronounced some documents of the time of Henry III. to be the earliest specimens of true English, modified, for the century and a half after the Conquest, into *Semi-Saxon*, designing to intimate by that compound that during those years a transition from Saxon into English was gradually and imperceptibly proceeding. In these pages, if the language is termed throughout *English*, that does not forbid such distinctions as Early English, Middle English, and Modern English, since it would be to mislead the youthful student to use any expression that would seem to imply the existence of an identity, or even any strong likeness, between the English of the ninth and that of the nineteenth century.

Now, as has been said years ago and often since repeated, it is by this very refusal to recognize the identity of the English language at the several stages of its growth that "all the necessary helps to a rational treatment of its grammatical forms and idioms have been cast aside." And Mr. Yonge, having cast these helps aside, has fallen into very irrational treatment of certain grammatical forms. For instance, all our English prefixes are dismissed as being syllables which represent no word in present use, "but which may be traced either to Latin or ancient German." The suffixes fare quite as badly. "Ship" and "scape" are forms of the German *schaft*. "Ric" is identical in meaning with the Latin *regnum*; but not a word is said about its early English use or the part it has had in forming so very familiar a word as the otherwise unintelligible masculine form of duck—drake. Looking on a little further we find that the *n* in "nightingale" is merely a particle "introduced to soften the pronunciation." How much simpler, and at the same time more accurate, it would be to show how this intermediate syllable is no particle, but only the letter *n*, which, after its manner, has thrust itself into a word where it has no business. Just as "passager" has become "passenger," and "messager" "messenger," so has "nightingale" grown out of "nightegale," as any one who has ever read Chaucer would know. Perhaps it is not to be taken for granted that Mr. Yonge has read Chaucer, as in his *Three Centuries of English Literature*, if we remember rightly, he says something about the obsoleteness of the *Canterbury Tales* having long rendered them unintelligible. But we have said enough to show how out of date and confused Mr. Yonge's treatment of his subject is, and how very unlikely his book is to be useful to the schools for whose use it has been written. All schools are, or profess to be, preparing their pupils for the University examinations, and the papers set for these examinations contain questions supposing a certain amount of knowledge of the English of the past by which to explain the English of the present. Such questions boys or girls who had learnt from Mr. Yonge that there is no identity between the two would find themselves quite unable to answer.

The author of the *English Grammar for Beginners*, though Head-Master of the Grocers Company's schools, is as dead to the fact that English grammar and English spelling can neither of them be properly taught unless in conjunction with philology as the Regius Professor whose work we have just censured. His work is very elementary, and does not pretend to go into the history of the language at all. It is, therefore, less likely to be mischievous than Mr. Yonge's. It contains, for the most part, such explanations of the different functions of the several parts of speech, and the rules for punctuation, as ought to be given orally if the teacher is fit for his work. Children so young as those for whom the book is intended understand what is *said* to them, especially on a subject so difficult to some young minds as grammar, very much better than they can take in what they read, or follow what is read to them.

M. Julien's little book is also the work of a practical teacher, and is intended as an introduction to his previously published *Petites Leçons*. It is intended for the use of very young children, and contains a variety of exercises composed of the simplest phrases in French and English, to be translated at sight by the pupils. The only difference we can find out to distinguish this *First Lessons in Conversational French Grammar* from the host of little books written on the so-called conversational method, which Dr. Ahn first put in practice, is that at the end of each chapter there are revising exercises and questions for an oral examination in grammar, which will save time and trouble to the teachers who make use of it. The words given are the most common and generally used, and the sentences not so far-fetched and ludicrous as in some other books of the same class.

The Child's Geography is a simple introduction to the study of geography, intended for children of seven or eight years old. The writer has been moved to write it by observing how ill-suited for beginners are the so-called manuals of geography mostly used in schools. He has found that geography, if it is to make any impression on a child's mind, must be taught from the map and not from the manual; and that before it can profit by the map the child must clearly understand the place which the world he lives in holds in the universe; the meaning of the divers figures traced upon the model of that world known as a terrestrial globe; and, lastly, the relation between the symbolism of the globe and that of the flat map of the geographer. All this is very clearly and pleasantly set forth in simple and well-chosen language. Moreover, *The Child's Geography* contains a great deal of information about the differences of soil and climate to be found in different parts of the earth's surface, and the causes of these differences. It also tells about the plants and animals to be found in foreign countries, and about the various races of mankind and the manners and customs which distinguish them from each other. The text is frequently broken by illustrations, which ought to go far to find favour for the book with the little folks for whom it is intended, as its illustrated pages are very much more attractive to look upon than the columns and sections of hard names to be learnt by heart that meet the eye on opening the old-fashioned geographical manual. We hope Mr. Ward will carry out the intention which he tells us in the preface he entertains of following up this elementary book with two others, similar in style, but suitable for more advanced students; for in this *Child's Geography* he has certainly succeeded in supplying a want which has long been felt of an elementary text-book of geography that should be at once simple and scientific.

The *Symbol Geography* redeems the promise of its title by containing a map wherein each considerable town, instead of having its name printed, is indicated by a symbol typical of the natural productions, the peculiar industry, or the historical event to which the town owes its importance. Thus in the map of Scotland, which is now before us, the birthplace of John Knox and other notable persons is symbolized by a cradle. Bannockburn and all the other battle-fields are signified by a figure like a small pair of scissors, intended, we believe, for cross swords. Dunlop, the tract of Ayrshire noted for its dairy-farming, is represented by a most unmistakable cheese, with the knife that has just cut it lying by, while Campbeltown and Glen-livat are represented by that form of whisky jar known in Scotland as a "greybeard," so huge in size that at first sight we took them for lighthouses. Indeed one great fault of the symbols is that they are as reckless of proportion as the animals in a Noah's Ark. The stag who ranges at will in the deer-forests of the North is about six times as large as the factory, chimney included, that marks a manufacturing centre; and this colossal animal finds a rival almost as big as himself in the sea-bird that broods over the rocks of Ailsa and the Bass. The *Symbol Geography*, however, is not so much a text-book as a showing forth of a system of teaching geography which the author has struck out for himself and found successful in teaching his own pupils. This system is to turn the lesson into a sort of game carried on by question and answer, in which readiness of reply depends on the player's knowledge of the productions of the country under consideration. The dedication is as original as the contents. It runs thus:—

> To the Teachers of those Boys and Girls who say "I do detest Geography," this Symbolic System of Teaching it is Dedicated by a Fellow Worker, who has often been gratified by hearing the above words changed for "I like Geography the best of all my Lessons."

To all such teachers we strongly recommend a new system of some sort, whether symbolic or other; for where children detest geography there must surely be something wrong about the teaching. Probably, if they do as the author suggests to them in his preface, and get their pupils to draw maps, at the same time giving them much information *vivâ voce* about the countries, they may be rewarded by as happy a change of opinion as he reports, without having recourse to the use of the symbols which most intelligent children would scout utterly as being babyish.

Mr. Taylor's Roman History is written on the same plan as the English and French histories from his pen. As we have already given our opinion of that plan in the reviews of these works, little remains to be said of the Roman History, except that it is well suited to be used as a companion to the others of the same series. Mr. Taylor does not lay claim to any original views about the facts which he here presents to his young learners, but acknowledges the debt he owes to Dr. Schmitz, Mr. E. A. Freeman, and other writers. Of these authorities the influence of the last is evident in every page, as Mr. Taylor has followed very closely the lines laid down by Mr. Freeman in his *General Sketch of European History*.

TRAVEL AND TROUT AT THE ANTIPODES.*

AS Mr. Senior is fain to admit in his opening chapter, the title of his book is somewhat deceptive, the Travel being out of all proportion to the Trout. From his home in Queensland he made a couple of flying trips to Tasmania and New Zealand, and in these he covered respectively distances of three and four thousand miles. But, if the fishing was scarcely all he could have desired, he had two most enjoyable holidays; and, what is of far more importance, so far as his readers are concerned, he has the art of imparting to them his pleasurable sensations. He writes easily and lightly, with a vein of fun; can tell a good story on occasion; seeing all that should be seen, he describes it shrewdly and succinctly; and, though he is compelled continually to express his intense admiration of the scenery, he has the self-restraint to indulge in his raptures discreetly, while giving us vivid conceptions of the features that impressed him. After reading many volumes of travel or touring in Australasia, we long ago came to the conclusion that, if we emigrated to the "fifth quarter" of the globe, we should unhesitatingly seek our new home in Tasmania. And all that Mr. Senior has to tell entirely confirms us in these prepossessions. We assume, of course, that we should go to the colony with a competency, and not with any notion of making a fortune. Tasmania never boasted of magnificent squatters with domains rivalling in extent some of the German principalities, and covered with countless flocks and herds that threw those of the patriarchs or the Esterhazys into the background. There are no merchants in Launceston or Hobart's Town who make any pretence to be even third-rate millionaires. Mr. Senior mentions in fact that young men of the farming class are inclined to leave the country for Australia and New Zealand; while those who perforce remain on their holdings grumble at having to work hard for small returns. But, on the other hand, there is a great deal of tranquil comfort; while the habits of living and the aspects of the landscape are exceptionally and unmistakably English. The familiar names of the townships and counties which have been borrowed from the old country are by no means out of keeping with the scenery or the style of farming. People used to drive across the island in a four-horse coach, with the coachman and guard got up in scarlet; though now, alas! the coaches have been run off the road. When the driver flung the reins to the helpers at the changes in old English coaching style, you stepped down to enter the roadside inn, where you called for foaming flagons of ale and were served with genuine mutton-chops. One drove between lines of well-kept hedges, and picked up and threw down parcels in villages which were surrounded with their orchards of cherry and apple trees. Yet the picturesque in the background blended with the homelike, and you looked up over forests hanging on the hill sides to ranges of mountains standing out against the sky. Those mountains and woods, which attract a heavy rainfall, send down the brawling streams that break in tempting pools and rushes among the lower slopes, and are supposed to be alive with the trout for which Mr. Senior went to angle. By way of sample of one of the Anglo-Tasmanian Edens, we may refer to his picture of the residence of the gentleman by whom his party happened to be entertained when they paid a visit to the famous breeding ponds. "We enter (the garden); refresh ourselves with raspberries, cherries, gooseberries; light a cigarette in an arbour covered with roses and honeysuckles; finish it under a wide-spreading walnut tree; inhale the odour of the herb borders; notice the asparagus, peas, seakale, and all the commoner vegetables; and behold how the owner can literally sit under his own vine and figtree." Outside is a brook running under hedges and dividing the fruit trees and vegetables from the hop-gardens, while beyond the paddocks through richly wooded grounds there flows beneath steep banks the river which feeds the salmon ponds. Yet, for those who love excitement and adventure, there are contrasts to the squire-like tranquillity of such an existence. We have a stirring account of a cattle-hunting-party which came off in the wilder part of the island. These herds of cattle run wild, and have to be followed over the most breakneck country. Their ancestors were of course imported, but they have come to regard man as their enemy, and on his appearance they take flight for almost inaccessible retreats. Of course, when they are "collared" by the horsemen, they charge fiercely; and Mr. Senior witnessed a more narrow escape than is often to be seen in the Spanish bull-ring. A knot of well-mounted sportsmen was accompanied by a scratch pack of powerful dogs. The party scattered through mountainous forest, broken by inaccessible gullies. "By and by the dogs give tongue, and there is a sound, not far distant, indicating a stampede." The horsemen started at full speed, trusting themselves very much to the instinct of their horses, escaping as by miracle collisions with the trunks or the branches, or the chance of being hurled headlong into a ravine. The herd, which consisted entirely of bulls, broke up into parties of two or three, and continued their headlong flight. It was then that one of the riders so nearly came to grief. He had followed a single animal at best pace up a grassy glade. As it happened, the glade ended in a *cul-de-sac*, and the hunted bull turned to charge. In speed, for a short distance, the horse had no chance with him. The rider, feeling his horse's hind quarters lifted bodily on the horns, swung round in his saddle and delivered three barrels of his heavy revolver. By great good fortune, the third shot told in a vital spot, and the bull rolled over in a confused heap, with the man and the gored horse.

After so thrilling an incident as that, any notes of the trout-fishing must sound tame. Mr. Senior professes himself not greatly disappointed with results, though he can only report fifty-four trout killed in about half as many outings. So far, indeed, as appearances went, the streams of Tasmania left nothing to desire; the grave drawback was the deficiency of fish. Then circumstances, as is apt to be the case everywhere, were often against the angler. The sun was bright, the skies were cloudless, and the water was clear. Or there was a flight of flies or of grasshoppers, blown into the river with each breath of air and gorging such fish as there were. The best day Mr. Senior had was certainly of the nature of a "fluke," and involved work and experiences that were literally painful. He waded up the rocky bed of a stream, under cover of the trees and bushes. Most of the casts he made were underhanded, and, bending himself for the most part almost double, he had to scramble over submerged logs. And, after all, he had only nine brace of trout, weighing from half a pound to a pound. Indeed most of the rivers are so thickly over-wooded as infinitely to increase the troubles of the fisherman, especially where fish are few and far between. Then Mr. Senior found them slow to take the fly, though he was told that that was owing to his attempting them in the worst part of the fishing season, and that, had his visit been earlier or later, he would have had less cause of complaint. But last and worst of all, they gave poor play when they were hooked; and a well-sized fish, after one feeble struggle by way of protest, would permit himself to be drawn quietly to the bank. The acclimatized trout would seem to have done well, and in point of size they thrive wonderfully. But it is unsatisfactory to learn that there is actually a doubt whether any of the salmon have survived. Captures have been reported authoritatively, and a so-called salmon was served at table to Mr. Senior. But he cannot conscientiously swear to the fact that it was salmon he tasted, and sceptics maintain that the "salmon" and grilses are really salmon trout. It follows, at all events, that the naturalized foreigners must have done very indifferently, otherwise heavy fish should have been taken by this time; and we can only suppose that the reason is to be sought in the excessive temperature of Tasmanian waters.

Tasmania, although now one of the most steady-going of British colonies, is not without its history and its unpleasant reminiscences. By way of contrast to the easy-going life in the peace and plenty of the rural paradise we have described, we may accompany Mr. Senior to what used to be an *inferno*, when Tasmania, known as Van Diemen's Land, was being colonized by our convicts and their guardians. "In its palmy days Port Arthur must have been—apart from its associations—a lovely spot." Its situation had marked it out for a penal settlement. It stood on Tasman's Peninsula, and was cut off from the mainland by a strip of land, fifty feet in width, which was strongly guarded. It consisted of prisons, barracks, and station buildings; "the sounds of compulsory labour mingled with the clinking of fetters . . . . and it carried out the purpose for which it was established, by punishing with a merciless rigour that has been exposed and prohibited, the criminals who were sent thither to work out their doom." By what seemed an irony of fate, those degraded and most villanous criminals were set to enhance the natural beauties of the spot by laying out gardens, terraces, and pleasure-grounds, embellished by graceful fountains and statuary. Now all has gone to wreck, and the pleasure-grounds are overrun with thickets of weeds frequented by venomous snakes. The buildings stand roofless, and the fortress is crumbling to pieces. Mr. Senior happened to force open the door of one of a row of abandoned cells. Within he came upon the skeletons of some sheep, who had evidently taken refuge from a storm, when the door must have been blown to upon them; and it would appear that it had never since been reopened. Immediately off Port Arthur lies Dead Island, so called because it was the cemetery of the settlement; it contains over 2,000 graves. When Mr. Senior paid his visit a solitary convict was in residence there. The man had been banished thither by the few guards who still at that time remained with a handful of convicts, because he had been pronounced hopelessly refractory after many attempts at coercing him.

We believe it may be rather owing to our personal predilections than to any shortcoming on the part of Mr. Senior that we have been more interested by the account of his sojourn in Tasmania than by the tour he subsequently made in New Zealand. For undoubtedly in New Zealand there is more to awaken interest and command attention in the shape of what is novel or sensational. He gives us lively sketches of the half-reclaimed Maoris as he had opportunities of seeing them; and very vivid pictures of the fantastic volcanic phenomena in a chapter appropriately styled "Wonderland." Indeed his descriptions of the eccentric New Zealand geysers are almost as good as those with which Lord Dufferin delighted us very many years ago, when he examined the marvels of Iceland in his *Cruise in High Latitudes*. As for the fishing, though Mr. Senior perhaps made it even more than in Tasmania the pretext for his travelling, yet it would seem on the whole to be more satisfactory. He enjoyed some tolerable sport himself; a friend who devoted himself to it did very well indeed; and the New Zealand trout are strong and "game," and really put you on your mettle to land them. Consequently the Acclimatization Societies which flourish in each

* *Travel and Trout in the Antipodes: an Angler's Sketches in Tasmania and New Zealand.* By William Senior (Red Spinner). London: Chatto & Windus. 1879.

district have every encouragement to persevere in their efforts. Great quantities of salmon fry have been successfully imported from California; and Mr. Senior reports that "in the course of a year or two, New Zealand should be a magnificent island for the trout-fisher."

DOWDENHAM.*

THIS is the dullest book that we have read for many a long day. It is past the wit of man to say how dull it is. Some books, though very dull in themselves, yet may be the cause that wit is in other men. But this story is too dull even to laugh at. When we reached the end we laid it down in despair, and felt as melancholy as if we were coming away from a wedding-breakfast or a City feast. We would rather criticize a collected edition of the *Court Circular* than give an account of this "Tale of High Life in the Present Period." We have no more feeling of having read a story than if we had gone through the fashionable intelligence of the *Morning Post*. We have read nearly five hundred pages about a Duke and a Duchess, and a Marquis and an Earl, and a Dowager Countess, and a Countess and a Baron, and a Count and a Viscount, and a great many other people of title; but what they have done we cannot remember. Perhaps in the high life in which the author moves people do nothing. If he was bent on writing a book, he was certainly wise in attempting to describe people whom he knows. For he does not take his great people secondhand. It has been his good fortune, he tells us, to accompany his Duchess in her walks, and he had the "privilege" to be one of the guests at Dowdenham, the Duke's country seat, on a most interesting occasion. It was at the close of the story. A repentant Marquis had returned home, like a second Prodigal. He had run away to America, and had lived among the Indians. His absence had been, indeed, noticed in society, but on his return the most scrupulous delicacy was observed. "Among intimates moving in good society," Mr. Ancketill tells us, "and associating daily in the same circle, the occurrence of such a *contretemps* as had occurred in the Duke's family is never made the subject of conversation. A well-bred reticence draws a veil over such disturbing events." In other words, in high life the rule is observed of never talking about ropes in the house of a man whose father has been hanged. To add to the general joy, the noble Prodigal had returned just in time to be present at the marriage of the Earl and the Viscountess, which was celebrated at Dowdenham. "No cloud flitted across the horizon to obscure the halo of happiness that dwelt beneath the Duke's hospitable roof." Halos, out of high life, are generally seen when there are mists about. What they may be like when they not only dwell, but also dwell beneath the roof of a Duke, we cannot pretend to say. However, there the halo was, and there also was the author in company with it, and beneath the same hospitable roof. There he had the privilege to see in the picture-gallery a tableau, which he wishes that he felt himself competent to describe. "On one side were arranged the bridal dresses, and on the other the numerous and splendid presents given by sympathizing friends to the respective brides." On one of the presents he recognized "the vigorous caligraphy of the venerable Dowager Countess." We had forgotten to mention—indeed, till we copied down the words "respective brides," we had forgotten the fact—that there were two weddings celebrated on the same day. Not only did an Earl marry a Viscountess, but a Major married a Contessa. It was a singular act of ducal condescension to allow a Major—a common Major whose father was utterly unknown—merely to dwell with the halo of happiness beneath the hospitable roof. But to go beyond this, to give him his wedding-breakfast, to associate him on such an interesting occasion with an Earl, requires, the reader will feel, some explanation. The fact was, the Major had just done the Duke the greatest service. He had tracked the runaway Marquis to British Columbia, and found him struck down with fever on a miserable pallet of dried leaves, and partially covered with leopard skins. The Marquis was wakened up from sleep by hearing one word—"Bellamont"—softly whispered into his ear. He tried to speak. "Placing his finger on his lips to enjoin silence, Major Head said, 'Take this medicine at once, and be composed; the event is in the hands of Providence.'" The author is perhaps an Irishman, and we shall not, therefore, too strictly criticize his statement that a man put his fingers on his lips to enjoin silence and spoke at the same time. However, the Marquis's life was saved; and such fidelity as the gallant Major had shown was not too highly rewarded even by the great honour that was done him on the occasion of his marriage.

Who is the hero of the story, whether indeed High Life knows anything of heroes, we are not able to say. The Earl certainly marries a lady who seems as if she were almost meant for a heroine; but heroines may be as little known as heroes in the best society. "The King for my money," cried Partridge when Tom Jones took him to see Garrick act Hamlet. "He speaks all his words distinctly, half as loud again as the other." In like manner we are inclined to say, after going through Mr. Ancketill's book, "The Duke for our money." He is perhaps at times a little oppressive, and certainly always very dull. But he is most exemplary in every relation of life, and very pompous. "Standing upon his hearthrug receiving his friends the Duke was in person, manners, and dignified geniality one of the best specimens of an English country gentleman." Even off his hearthrug—for a Duke cannot be expected to be on it all day long—he is still a scarcely less fine specimen. He is gifted with a most remarkable facility of quotation. The Earl, at the opening of the story, is, we are told, forty-three years old, and unmarried. The Duke advises him to marry, and fires off straightway three quotations at him in support of his advice. The Marquis on one occasion required a father's counsel. The Duke retired after breakfast into his private sitting-room, where it was his custom, we read, to peruse the morning papers and inform himself of the passing events of the day. On the hearth on this eventful day blazed some billets of wood with a simmering noise and blue flame peculiar to that description of fuel. He touched a silver bell, and a groom of the chambers entered. The Marquis was summoned. The father first quoted to him the great Lord Burleigh's advice to his son. Next he read an extract out of a volume which he took from the bookcase. Then he quoted a great philosopher; and, last of all, he quoted either the same or another great philosopher who has written about "the lexicon of youth." The son seemed to be convinced, but after all he ran away to America. Perhaps he had some reason, for even a duke and a father can quote too much. His Grace was not only fond of reading, but he was an excellent elocutionist. So condescending and so refined a nobleman as this can be turned to the best account by a skilful writer. Mr. Ancketill, for instance, is almost as good at poetry as he is at prose; but he is, it would seem, too modest to publish his verses in his own name. Nothing is easier than to make the Duke call for some lines which one or other of the characters had written. "By the by," said the Duke, at the very time when the halo of happiness was dwelling beneath his hospitable roof, "you promised to read us your piece of poetry to-day. I had almost forgotten to remind you of your promise." The poet was too shy, but the Duke offered to read it aloud himself, saying, "We shall just have time; there's an hour till dinner-time yet." One of the stanzas begins:—

> List! from the murky darkness deep,
> A lurid glare amid the storm.

Among intimates moving in good society a poet, we can readily believe, is never asked to explain how any one can listen to a lurid glare. Certainly in the fourth line we read "A minute-gun gives loud alarm"; but as certainly it is to the lurid glare that we seem to be invited to listen. The poem does at last come to an end, and the eloquent elocutionist can rest his ducal voice. "Oh my gracious, ladies," says the Duchess, "there's the first dinner-gong sounding. We have not a moment to spare." Such an exclamation is perhaps a little startling in one who "possessed all the attributes of a perfectly aristocratic and well-bred lady." But let not the reader judge her and her order too harshly. Let not "the sneering democrats" of whom Mr. Ancketill writes venture to disparage duchesses. Let him remember what she had just gone through. The wonder is that she did not exclaim, "Oh my gracious!" a good deal earlier. Yet she had listened in patience and in silence while the Duke was reading such verses as the following:—

> Say, Neptune, god of Ocean deep,
> Why, seated on thy wave-borne throne,
> Did'st not ashore with trident sweep
> This faithful pair—save them alone?
> Was 't anger that the brave dog dared
> To bear thy name, of billows lord,
> Or Amphitrite's love, that spared
> No thought from her, beloved, adored?

It is pleasant to turn from the Duchess when seated in comfort by her fireside, listening to poetry and crying out "Oh my gracious!" to the Duchess when visiting her tenantry. "It was once the author's good fortune," he writes, "to accompany her on one of her tours amongst her cottagers." Having described her affability and her pious condescension, he then turns round upon "the sneering democrats who, if they chance to read these pages, will doubtless characterize the description I have given of a scene of which I was a witness as sentimental twaddle." But, after all, he must not be too hard on these miserable creatures. He must remember that they were, as he himself says, "born in crowded cities where the discomfort and want of cleanliness pervading the dwellings of the bulk of the manufacturing poor precludes the domiciliary visits of ladies. Happy rural England!" he goes on to exclaim, and then utters a pious wish that in the sister country the same blessed state of things were possible. But in the country in Ireland duchesses can no more visit poor people than in the towns in England. "Were there no other obstacles, the religious difficulty renders it impracticable, and the want of cottage cleanliness absolutely prohibits ladies from entering the dwellings of the poor, which they rarely attempt to do." We sincerely pity the poor both of our own towns and of the whole of Ireland. Discomfort is hard enough to bear in itself. It is indeed cruel when it precludes the domiciliary visits of ladies. Though they cannot enter the dwellings of the poor, yet possibly they might go to the outside of the houses of those who are most deserving, and leave copies of this Tale of High Life. It would surely be a good action to let these poor creatures know how much they lose by their religion and their manner of life.

---

* *Dowdenham: a Tale of High Life in the Present Period.* By W. R. Ancketill, Author of "The Adventures of Mick Callighin, M.P." London: Marcus Ward & Co. 1879.

MINOR NOTICES.

MR. LANG'S volume on Oxford (1), the contents of which have, we believe, previously made their appearance in the *Portfolio*, is one of the most agreeable and interesting works that we have seen for a long time. The author has the gift, or accomplishment, or both, of a singularly happy style and method. He is never pedantic and never frivolous. He makes one interested when it is desirable in things the essence of which may be dry enough, and he can be light without a hint of forced gaiety or claptrap. He knows his subject thoroughly, and he has given his knowledge to his readers in the most attractive and judicious form. Perhaps the most brilliant, as a literary feat, of his chapters is that headed "The Early Students: a Day with a Medieval Undergraduate." This is certainly as vivid and probably as true a picture of the time as any one could desire to have; and it is difficult to believe while one reads it that Mr. Lang has not been himself accustomed, in bygone ages, to "play pyked staffe" at the Beaumont with Roger de Freshfield and Henricus de Bourges. "Poets at Oxford," again, is admirably contrived. Mr. Lang's last chapter is called "Undergraduate Life," and with this well-worn subject he deals with surprising pithiness and freshness. A Cambridge reviewer may naturally be annoyed at what reads like a dig at Cambridge in the opening paragraph; but such annoyance is perforce dispelled by the writing of one who really has something to say, and who knows how to say it, on a subject which countless dabblers in fiction and essay have done their best to spoil. It is hardly fair to Mr. Lang to make any excerpt from a piece of writing in which conciseness is a striking merit, but his second paragraph contains so much in so few words that we must venture to quote it:—"There is yet another cause which increases the difficulty of describing undergraduate life with truth. There are very many varieties of undergraduates who have very various ways of occupying and amusing themselves. A steady man, who reads his five or six hours a day, and takes his pastime chiefly on the river, finds that his path scarcely ever crosses that of him who belongs to the Bullingdon Club, hunts thrice a week, and rarely dines in hall. Then the 'pale student' who is hard at work in his rooms or in the Bodleian all day, and who has only two friends, out-college men, with whom he takes walks and tea—he sees existence in a very different aspect. The Union politician, who is for ever hanging about his club, dividing the house on questions of blotting-paper and quill pens, discussing its affairs at breakfast, intriguing for the place of Librarian, writing rubbish in the suggestion-book—to him Oxford is only a soil carefully prepared for the growth of that fine flower, the Union. He never encounters the undergraduate who haunts billiard-rooms and shy taverns, who buys jewelry for barmaids, and who is admired for the audacity with which he smuggled a fox-terrier into college in a brown-paper parcel. There are many other species of undergraduates, scarcely more closely resembling each other in manners and modes of thought than the little Japanese student resembles the metaphysical Scotch exhibitioner, or than the hereditary War Minister of Siam (whose career, though brief, was vivacious) resembled the Exeter Sioux, a half-reclaimed savage, who disappeared on the war-path after failing to scalp the Junior Proctor. When the Wet Blanket returned to his lodge in the land of Sitting Bull, he doubtless described Oxford life in his own way to the other Braves, while the squaws hung upon his words, and the papooses played around. His account would vary in many ways from that of

> Whiskered Tomkins from the hall
> Of seedy Magdalene.

And he again would not see Oxford life steadily, and see it whole as a more cultivated and polished undergraduate might. Thus there are countless pictures of the work and ways of undergraduates at the University." For the illustrations as for the letterpress of Mr. Lang's delightful volume we have nothing but praise.

Mr. Halliwell-Phillips makes yet another addition to the vast mass of writing that has been hung, and will doubtless continue to be hung so long as human nature is unchanged, upon Shakspeare's name (2). The author has the virtue of modesty, in that he says in his preface, "The more I read of the tragedy of *Hamlet* the less I really understand it as a whole, and now despair of meeting with any theories that will reconcile its perplexing inconsistencies, making, of course, allowances for those that are most likely intentional." Mr. Halliwell-Phillips adds that he does not hope to have done more than make a few suggestions which may be worthy of consideration. Among such suggestions the most remarkable perhaps is that, "so far from Hamlet being indecisive, although the active principle in his character is strongly influenced by the meditative, he is really a man of singular determination, and, excepting in occasional paroxysms, one of powerful self-control." This theory the author goes on to support by reference to, of all things in the world, the scene in which Hamlet, left alone after the Ghost's disappearance, is joined by his friends and followers. His "wild and whirling words" are, according to the ingenious commentator, the expression of a resolution formed by a powerful intellect to "outwit his companions by banter"; he treats the apparition "with intentional and grotesque disrespect and jocularity at a moment when an irresolute mind would have been terrified and prostrated." This may give people eager to devour Shakspeare commentaries some idea of what they have to expect from these "memoranda," which, if not better, are not worse than the majority of their class. But, with few exceptions, "the best of this kind are but shadows." At the end of Mr. Halliwell-Phillips's little book is found, under the title of "Æsthetic Criticism," what seems to be meant for a humorous allegory, to the humour of which we unfortunately do not possess the key.

The *Era Almanack* (3) for the current year has, in addition to its familiar attractions, a collection of "autograph letters of eminent actors," the writing of which is reproduced with remarkable accuracy, and which have been well chosen to exhibit the characteristics of the writers. It is curious to find the late M. Fechter writing, "Je t'envoie M. ——, qui joue Leartes (*sic*) dans Hamlet," but no doubt this was a mere slip of the pen.

The *Theatre* magazine (4) has entered on a new career under the editorship of Mr. Clement Scott, who is thoroughly qualified for the work which he has undertaken. It contains reviews, signed by well-known critics, among whom the editor himself is numbered, of dramatic and musical performances, some interesting notes on Shylock in Germany, two well-executed photographs of Miss Terry and Mr. Irving in the *Merchant of Venice*, and a discussion, with which the magazine opens, on the question whether, as a good many people have said, there is a dearth of dramatists in England. Mr. Irving writes first on this, from the fulness of a not altogether pleasant experience as a manager. As might be expected, he has been besieged with numberless manuscripts which, with varying degrees of literary merit, "possess one characteristic in common—they are wholly unadapted to the stage. The most curious part of it is that their authors are often conscious of this defect, but do not think it of much account. A gentleman writes to me that he has no knowledge of stage requirements, but has little doubt that, if I approve his play, the necessary alterations can be made. The assumption is that I am to spend my time and pains in trying to turn some quires of dialogue into an acting drama." This is obviously absurd, and aspiring dramatists will do well to lay to heart what Mr. Irving points out—that from Shakspeare downwards successful dramatists have known or learnt something of the practical working of the stage. "One of the most amusing heresies of our time," says the writer, "is that which denies to Shakspeare the authorship which has made him famous; but, if any proof were needed, I have always thought the wonderful acting quality of these dramas a conclusive circumstance in his favour." It is melancholy to think of Mr. Irving surrounded by impracticable "quires of dialogue." Mr. Bendall and Mr. Palgrave Simpson both do good service in exploding the notion of "A Dramatic Ring"—a convenient formula used by would-be playwrights to express the fact that the number of people who have talent and industry enough to write well for the stage is limited, and that they themselves are not, as yet at any rate, of the number. At the same time, it is certainly not more easy, and there is in the nature of things no reason why it should be, to get a first play produced than to get a first novel or volume of poems published. Mr. Moy Thomas, though "far from wishing to say that there is as much encouragement for untried authors as is desirable in the interests of the public," yet in the main agrees with the writers who have preceded him; but in his last sentences, which seem to us much to the point, he introduces a new suggestion. Mr. Neville's experience has naturally been much the same as Mr. Irving's. Mr. Burnand, in the characteristic and amusing paper which ends the discussion, hits what is certainly a blot in our present system, and it is to be hoped that his words will have effect. In the rest of the magazine we may note an excellent article by Mr. Joseph Knight on Mr. Toole, and an enthusiastic and pleasant article by Mrs. Boursot on "Richard Wagner's Mission."

Mr. Pascoe has not, perhaps, made the best use of the opportunities afforded him by the issue of a second edition of his *Dramatic List* (5), which is neither so correct nor so complete as we should like to see it. He has added more than a hundred names, and the incompleteness, of which he is conscious, is certainly not altogether his own fault. But it is odd, for instance, to find no mention either of Mr. Alfred Bishop or of Mr. Norman Forbes. Again, as the late Mr. John Parry is included in the appendix, it seems inconsistent that there should be not a word about Mr. Corney Grain in the bulk of the volume. From a notice of Mr. F. Cooper we are led to infer that Mr. Pascoe regards Laertes in *Hamlet* as a subordinate part. Some trifling but odd mistakes of fact have caught our eye, such as, for example, the statement that Mr. Clifford Cooper was the original Colonel Challice in *Alone*. Unless we are strangely mistaken, he was the original Stratton Strawless. But as long as the stage con-

(1) *Oxford: brief Historical and Descriptive Notes.* By Andrew Lang, M.A. With Etchings and Vignettes by A. Brunet-Debaines, H. Toussaint, and R. Kent Thomas. London: Seeley, Jackson, & Halliday.

(2) *Memoranda on the Tragedy of Hamlet.* By J. O. Halliwell-Phillips, F.R.S., &c. London: Printed by J. E. Adlard.

(3) *The Era Almanack.* Conducted by Edward Ledger. London: 49 Wellington Street, Strand.

(4) *The Theatre: a Monthly Review of the Drama, Music, and the Fine Arts.* Edited by Clement Scott. London: Dickens & Evans.

(5) *The Dramatic List.* Edited by Charles E. Pascoe. Second Edition, revised and enlarged.

tinues to be a popular institution there will be a demand for such a compilation as Mr. Pascoe's, and probably he will find an opportunity of correcting what errors still remain in his work.

Miss Lushington's little story (6), which is founded on fact, is told with much grace and simplicity. Its tone is religious without being goody. Our only objection is to its conclusion, and it must be admitted that, from the author's point of view, there would be some obvious objections to any other ending.

Marion's Story (7) is written by a lady whose earlier works—simple Scottish tales—have earned a measure of well-deserved popularity, and who is now, we believe, in India. It "was originally written in aid of the Magdalen Asylum at Madras," and is published in an enlarged form "in the hope that it may interest a wider circle of readers." Unlike *Moray* and *Geordie's Tryst*, which were published before the author's marriage, *Marion's Story* is not intended for children; its purpose being one of warning and help to young women. Its subject is treated with scrupulous delicacy, and without the introduction or even the suggestion of any sense of vice or peril. The book is one which may usefully be placed in the hands of domestic servants and in the reading-rooms of shops and houses of business in which girls are employed. Its style is natural and graceful, and the delineation of character painstaking and true to experience.

The Chandos Classics (8) are capitally got up and printed. Some people will no doubt be shocked at the modernizing of Spenser's spelling, though it has been done with the utmost care to avoid any mutilation of the text. The question is in fact whether, in words which for the purposes of the metre can be spelt either way, the old or new spelling is the pleasanter to look at.

Mr. Evelyn Ashley has done well in preparing an edition in two volumes of his now well-known Life of Lord Palmerston (9), which was originally issued in five volumes. In the present edition some fresh letters and other new matter make their appearance.

The changes which have taken place since the publication of the fourth edition of Addison on Torts (10) have made it necessary for Mr. Cave in preparing a fifth edition to reconsider the system of arrangement previously adopted. He has among other changes relegated, for very sufficient reasons, the consideration of the rights and duties of bailors and bailees *inter se*, the duty of carriers in carrying goods, and the power of landlords to distrain for rent, to Addison's equally well-known work on Contracts.

Mr. Haynes's work (11) "owes its origin chiefly to the enactment in the Judicature Act 1875, to the effect that the former practice, where not inconsistent with the Acts or Rules of Court, may continue to be used in the High Court of Justice and in the Court of Appeal." Of course absolute knowledge of every detail of the new system cannot be expected, since, as Mr. Haynes observes, "considerable lack of uniformity and differences of opinion respecting some of the minor points of procedure exist in the various Offices and Chambers." Mr. Haynes's work fills a gap which till its appearance had existed, and will no doubt be of use both to students and practitioners.

As *remanets* from Christmas we have Mr. Ballantyne's story (12), which is told in his best manner, and *Only Five* (13), a pretty little child's story, with attractive illustrations.

The third volume of *The Hundred Greatest Men* (14), the first two volumes of which were noticed some time ago in a separate article, deals with religious heroes. It is divided into two parts. The first begins with Moses and ends with Mahomet; the second begins with St. Paul and ends with Wesley. The former of these has a preface by Professor Max Müller, while the second is introduced by M. Renan.

Messrs. Kegan Paul and Co., taking a hint from French publishers, have begun a series of parchment-bound volumes with a well-printed edition of *In Memoriam* (15). The attractiveness of the paper and print will not balance the great disadvantage found in the obstinate refusal of the pages to lie open. Herein lies a most unfortunate difference between the model and the copy. We fail altogether to see the appropriateness of placing an *eau forte* (after the late Mrs. Cameron's fine photograph) of the Laureate himself at the beginning of the volume.

It may be presumed from internal evidence that the author of *A Year's Cookery* is American (16). Such dishes as fried hominy and German sausage are not popular in England, nor is it desirable on sanitary grounds that the latter dish should be recommended to anybody. But a person with any knowledge of the subject may get a good many hints from Mrs. Browne's carefully-arranged volume.

Mr. Sandlands has succeeded in producing a book on the use of the voice in public speaking (17) which is at once sound in theory and written with plainness and common sense. A strange proof is given of how little the subject is understood or studied by those whose constant care it ought to be, in a passage towards the end of the volume. Mr. Sandlands has just set forth, in well-chosen words, a fact which ought to be well known to every person who is called upon to address an audience. This fact is that the student may have mastered the complicated mechanism of elocution perfectly, and still it may be said of him that "he is not yet an artist. The whole realm of thought—his own thought, as well as that embodied in language—lies before him, and his art consists in giving expression to it in real, living words." Mr. Sandlands goes on to say:—"This opinion, I know, will be at variance with that of many in authority. It will, I have no doubt, be the subject of ridicule." This, we confess, surprises us; but it must be presumed that Mr. Sandlands knows well what is the average amount of intelligence and interest given to this subject, and we can only hope that his valuable book will do something to make the standard higher. Of course no art can be learnt from books, but amongst English books that we have seen on this matter, Mr. Sandlands's is far the best. He is not only right practically in his conclusions, but he gives reasons for every one of them.

Messrs. Ward and Lock have brought out an illustrated edition of Whiston's *Josephus* (18). The print, though good, is distressingly small, and the volume is very unwieldy. It would surely have been better to divide it.

The Clarendon Press has issued a most convenient edition of the *Pilgrim's Progress*, *Grace Abounding*, and their author's relation of his imprisonment (19). Canon Venables has edited the volume, and furnished it with a biographical introduction and notes. His work has been done with complete care, judgment, and clearness.

Dr. Maudsley has given us, under the name of *The Pathology of Mind* (20), a third edition of the second part of the *Physiology and Pathology of Mind*, recast and enlarged. It is impossible to do justice in a short notice to a work of the value and importance of this volume, and we must be content, for the present at least, with merely noticing its appearance.

Messrs. Kent and Co. have produced a pocket Milton (21) in two tiny volumes, the printing of which is beautifully clear.

Mr. Barnard's illustrations of characters in *Pickwick* (22) are full of the force and invention which his pictures are apt to display. The "Jingle" is admirable in catching in one look and attitude all the characteristics, good and bad, of the man's nature; and the "Bill Sikes" has an almost appalling air of truthfulness. We have heard it objected to the "Sidney Carton" that it is too theatrical, which we take to mean that it is a finely dramatic illustration of a finely dramatic incident.

Mr. Marshall's name is in itself warrant enough for the excellence of the valuable book or pamphlet which he has produced under the name of *A Rule of Proportion* (23). The plan on which the work is constructed was set forth in a lecture delivered by Mr. Marshall some years ago at the Government School of Design in South Kensington.

The new and convenient edition of Colonel Lockhart's *Doubles and Quits* (24) will be greeted with pleasure by the many admirers of the author's singularly bright and pleasant style. But why should it have illustrations such as the wildest dreams after seeing the wildest pictures have never equalled? Who is Sylvestris, and will he ever do it again?

In the current number of the new *Tales from Blackwood* (25) the cleverest story is, we think, "Mrs. Beauchamp's Vengeance."

(6) *A Land and Sea Story.* By Ellen E. Lushington. London: Walter Smith.

(7) *Marion's Story.* By the Author of "Moray," "Geordie's Tryst," &c. London: Hodder & Stoughton.

(8) *The Chandos Classics.—Charles Lamb: Poems and Essays. Spenser: The Faëry Queen.* London: Warne & Co.

(9) *The Life and Correspondence of Henry John Temple, Viscount Palmerston.* By the Hon. Evelyn Ashley, M.P. 2 vols. London: Bentley.

(10) *Addison on the Law of Torts.* Fifth Edition. By L. W. Cave, Q.C. London: Stevens & Sons.

(11) *The Practice of the Chancery Division of the High Court of Justice and on Appeal therefrom.* By John F. Haynes, LL.D. London: Stevens & Sons.

(12) *Philosopher Jack: a Tale of the Southern Seas.* By R. M. Ballantyne. London: Nisbet & Co.

(13) *Only Five.* By Ismay Thorn. With Illustrations by T. Pym. London: Shaw & Co.

(14) *The Hundred Greatest Men.* Vol. III. Religion. London: Sampson Low & Co.

(15) *In Memoriam.* London: Kegan Paul & Co.

(16) *A Year's Cookery.* By Phillis Browne. London, Paris, and New York: Cassell, Petter, & Galpin.

(17) *The Voice and Public Speaking.* By J. P. Sandlands, Vicar of Brigstock. London: Hodder & Stoughton.

(18) *The Works of Flavius Josephus.* Translated by William Whiston. With 100 pages of Engravings. London: Ward, Lock, & Co.

(19) *Clarendon Press Series.—Bunyan. The Pilgrim's Progress, Grace Abounding, and a Relation of his Imprisonment.* Edited, with Biographical Introduction and Notes, by Edmund Venables, M.A., Precentor and Canon of Lincoln. Oxford: Clarendon Press.

(20) *The Pathology of Mind.* By Henry Maudsley, M.D. London: Macmillan & Co.

(21) *The Poetical Works of John Milton.* 2 vols. London: Kent & Co.

(22) *Character Sketches from Dickens; being Facsimiles of Original Drawings by Fred. Barnard.* London, Paris, and New York: Cassell, Petter, Galpin, & Co.

(23) *A Rule of Proportion for the Human Figure.* By John Marshall, F.R.S. Illustrated by John S. Cuthbert. London: Smith, Elder, & Co.

(24) *Doubles and Quits.* By Laurence W. M. Lockhart. With Twelve Illustrations by Sylvestris. New Edition. Edinburgh and London: Blackwood & Sons.

(25) *Tales from Blackwood.* No. XXI. Edinburgh and London: Blackwood & Sons.

Short's counsels and receipts can be thoroughly recommended (26). The author is orthodox on the subject of salads, and his directions are clear and concise.

The forty-second edition of that invaluable work *Burke's Peerage* (27) has made its appearance. Sir Bernard Burke notes in the course of a few prefatory words that in England "false assumptions can be at once detected, whereas in France, Germany, or Italy it is well-nigh impossible to determine who are and who are not entitled to titulary distinction." Readers of Mr. Hamerton's charming book *Round my House* will be reminded of his description of the various steps by which a Frenchman of untitled birth ennobles himself.

(26) *Breakfasts and Luncheons at Home.* By Short. London: Kirby & Endean.

(27) *Burke's Peerage, Baronetage, and Knightage.* London: Harrison.

The author of "John Halifax, Gentleman," requests us to state that the novel entitled "Dorcas" was written not by her, but by Miss Georgiana M. Craik.

CONTENTS OF No. 1,264, JANUARY 17, 1880:

CONTENTS OF No. 1,263, JANUARY 10, 1880:

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

ADVERTISEMENTS.

MR. C. H. LAKE'S SCHOOL, "Witherndon," CATERHAM VALLEY, RE-OPENS January 20. Boys receive individual attention.

LANCASTER SCHOOL.—NEXT TERM begins January 21, 1880. Board and Tuition 55 Guineas per annum.—Address, Rev. W. E. PRYKE, M.A., Head-Master.

ARMY, COOPER'S HILL, INDIAN CIVIL SERVICE, &c. Rev. Dr. WRIGLEY, M.A. Cambridge, formerly Professor of Mathematics at R. I. M. C., Addiscombe, prepares PUPILS, by whom the highest places have frequently been obtained. Sons of Clergymen, and of Indian Officers and Civilians received at exceptional rates.—Address, 67 High Street, Clapham, S.W.

THE PHILBERDS PREPARATORY SCHOOL (near MAIDENHEAD).—BOYS are specially prepared for the Scholarship and Entrance Examinations at all the Public Schools; also for the Naval Cadetship Examination. After the Christmas Vacation the Management of the School will be in the hand of Mr. E. M. PRICE, Mr. F. W. S. PRICE, and the Rev. W. H. GWILLIM, all of St. John's College, Cambridge. In the meantime, for full information, apply to the present Head-Master, the Rev. E. H. PRICE. In the New House a JUNIOR PREPARATORY SCHOOL has been established for quite LITTLE BOYS.

MATRICULATION.—UNIVERSITY of LONDON.—Pre-paration in all subjects. The next COURSE of LESSONS, under the direction of PHILIP MAGNUS, B.Sc., B.A., will COMMENCE on February 2, 1880. Address, 48 Gloucester Place, Portman Square, W.

PRIVATE TUITION.—A COUNTRY RECTOR, experienced, receives FOUR PUPILS with his own Sons. Terms, Sixty Guineas.—Address, ALPHA, 138 High Street, Guildford.

ROYAL MILITARY COLLEGE, SANDHURST.—Mr. WALTER WREN, M.A., Christ's College, and the Rev. H. P. GURNEY, M.A., Fellow of Clare Coll., Cambridge, prepare Resident and Non-Resident PUPILS for the Line, the Woolwich, the India Civil Service, and other Competitive Examinations. References to numerous Successful Candidates in the last and former Competitions.—3 Powis Square, W. Prospectuses may be obtained from Mr. WATERS, Bookseller, 97 Westbourne Grove, W.

H. HART, M.A., late Fellow of Trinity College, Cambridge, and Mathematical Instructor at the Royal Military Academy, Woolwich, wishes to prepare a few BOYS for the Public Schools.—Address, Avalon House, Eltham, Kent.

THE GRANGE, BUSHEY, Herts.—Miss WILKIE receives a limited number (TWENTY-FIVE) YOUNG LADIES for BOARD and EDUCATION. High-Class Professors from London attend for English, French, German, Latin, Mathematics, Drawing, Music, Singing, and Dancing. A large proportion of the Pupils have annually passed the Oxford and Cambridge Examination.

SCHOOL for BOYS, age Five to Fourteen. Recommended by the Rev. Dr. Jex-Blake, Head-Master of Rugby; the Rev. Canon Duckworth, D.D., 77 Hamilton Terrace, N.W.; the Rev. Dr. Abbott, Head-Master of the City of London School. For terms apply to Rugby House, 77 Avenue Road, Regent's Park, N.W. Term begins January 19, 1880.

ARMY EXAMINATIONS.—Professor PRITCHARD (late R.M. Academy, Woolwich), and Rev. A. PRITCHARD (M.A. Oxon) have as yet passed 18 Pupils out of 21 sent up since January last. The TERM commenced January 6, 1880.—Wargrave, near Henley, Oxon.

BOURNEMOUTH.—CHELTENHAM HOUSE (facing the Sea). J. WILLIAM WILLIAMSON, M.A., Oxford, receives a limited number of BACKWARD and DELICATE BOYS, to Prepare for the Public Schools or for general Education.—Full particulars and prospectus on application.

WOOLWICH, ARMY.—MORGAN JENKINS, M.A. (Wrangler), assisted by an able staff of Graduates in First-class Honours, prepares PUPILS for the above. All sent up at the last two Examinations of Lieutenants of Militia, viz. three in April, and two in October, passed; also three last July for Sandhurst, and eight out of eleven at different times for Woolwich, one being Second in July 1877.—50 Cornwall Road, Westbourne Park, W.

HIGH-CLASS EDUCATION, strictly Select.—The Rev. A. C. TODD, late of the Punjab, India, prepares PUPILS for the Legal, Medical, Civil Service, and other Examinations, at the Manse, Tattenhall, Cheshire.

ARMY EXAMINATIONS.—Mr. BELL, Limpsfield, Redhill, is now able to undertake the Tuition of One or Two PUPILS for the above Examinations. Next Term begins January 20. For further particulars, address as above.

A LADY wishes to recommend the SCHOOL NEAR LONDON where her Daughters' education was finished. Only DAUGHTERS of GENTLEMEN of position received. Sixteen Pupils. Large detached house. Good garden. French and German Resident Governesses. She cannot speak too highly of the care and kindness of the Principal, or of the educational advantages. Really an educational home. Special care bestowed on delicate girls.—References to Mrs. HALDANE, 1 Grosvenor Crescent, Edinburgh.

LIBRARIAN, SECRETARY, or BOOKSELLER'S ASSISTANT.—A YOUNG MAN, having three years' experience in a London Theological Bookseller's, and with knowledge of English Literature, Latin, and French, desires EMPLOYMENT as LIBRARIAN, or BOOKSELLER'S ASSISTANT. Understands Postal and Telegraph duties. Full references.—Address, M. E. C., 7 Hamilton Road, N.

JANUARY ELECTION, 1880.—FIFTH APPLICATION.

ORPHAN WORKING SCHOOL, Haverstock Hill, N.— An Earnest Appeal is made to the GOVERNORS and SUBSCRIBERS for VOTES and Interest on behalf of GEORGE STEEL HOLMAN, the youngest of three Orphans, aged Six, Ten, and Twelve. Both Parents are dead. The Case is strongly Recommended by Lady BROMLEY, 30 Loughborough Road, Brixton; G. A. SPOTTISWOODE, Esq., New Street Square; J. P. BACON, Esq., 69 Fleet Street, E.C.; Rev. G. K. FLINDT, Rectory, Denmark Hill. Proxies will be thankfully received by Mr. J. T. RUSSELL, 25 Wellington Road, Cold Harbour Lane.

TRUSTEES are directed to SELL the ADVOWSON of the RECTORY of CATSFIELD, near Hawkhurst, in the County of Sussex. Good Rectory House and 34 acres of Glebe. Net income, exclusive of House and Glebe, about £220 per annum.—For further particulars apply to Messrs. BELL & STEWARD, 49 Lincoln's Inn Fields, London, W.C.

TRUSTEES are directed to SELL the ADVOWSON of the VICARAGE of DALLINGTON, near Hawkhurst, in the County of Sussex. There is a suitable Parsonage House, in good repair. Net income, about £250 per annum. Church recently restored.—Further particulars may be had of Messrs. BELL & STEWARD, 49 Lincoln's Inn Fields, London, W.C.

TRUSTEES are directed to SELL the ADVOWSON of the RECTORY of LLANELIEU, near Hay, in the County of Brecknock. Income, about £100 per annum.—Apply to Messrs. BELL & STEWARD, 49 Lincoln's Inn Fields, London, W.C.

TRUSTEES are directed to SELL the ADVOWSON of the RECTORY of LLANSAINTFREAD, near Brecon, in the County of Brecknock, in a most beautiful locality. Good Rectory House. Net income, about £270 per annum.—Further particulars of Messrs. BELL & STEWARD, 49 Lincoln's Inn Fields, London, W.C.

TRUSTEES are directed to SELL the ADVOWSON of the RECTORY of LLANVILLO, with the CURACY of LANDEVAILOG TIE'R GRAIG, in the County of Brecknock, situate in a most beautiful part of the country. Tithe commutation, £322 per annum. Good Rectory House.—Further particulars may be had of Messrs. BELL & STEWARD, 49 Lincoln's Inn Fields, London, W.C.

OFFICES—THE GROSVENOR GALLERY, NEW BOND STREET, W.

ABRIDGED PROSPECTUS.

The objects of the Grosvenor Library are fully set forth in the Memorandum of Association, but the following deserve especial attention. To establish a Circulating Library, with a constant supply of all New Books, Periodicals, and Magazines, and all new Foreign and Colonial Books, a Library for reference of selected and Standard Works, Reading and Writing Rooms, amply stored with all leading Newspapers and Reviews, English, Foreign, and Colonial, Dining and Refreshment Rooms, where Dinners and Luncheons will be served in the style of first-class London Clubs, Cloak Rooms for the reception of parcels, &c., together with furnished Lavatories, Retiring and Dressing Rooms. To book seats for all the London Theatres, Concerts, and other places of Entertainment, a Circulating Library of all New Instrumental and Vocal Music, for the sale of all New Books, and for the disposal of the surplus stock of such works of permanent interest as have passed out of circulation.

The only Contract that has been entered into is an Agreement dated December 17, 1879, between Sir COUTTS LINDSAY of the one part, and ALEXANDER RIVINGTON, for himself and on behalf of the Company therein stated to be about to be formed under the name of the GROSVENOR LIBRARY, LIMITED, of the other part.

Full Prospectuses and Forms of Application for Shares may be obtained at the London and County Bank, 21 Hanover Square, or any of its Branches, the Solicitors and Auditors, and also at the Offices of the Company in New Bond Street.

DENT'S CATALOGUE.—New Edition, Illustrated, and de-scribing several hundred varieties of WATCHES, CHRONOMETERS, CLOCKS, &c., will be forwarded free on application to
61 Strand, or 34 and 35 Royal Exchange, London.

SATURDAY REVIEW

OF

POLITICS, LITERATURE, SCIENCE, AND ART.

No. 1,265, Vol. 49. January 24, 1880. [Registered for Transmission abroad.] Price 6d.

THE COMING SESSION.

It is not easy to judge beforehand whether the Session is likely to begin with animated debates. The Ministers must necessarily stand on the defensive; and they will probably furnish in the Speech from the Throne harmless and useful occupation for Parliament in the time devoted to practical business. The orators of the Opposition, as distinguished from its responsible leaders, have throughout the recess and to the eve of the Session rather fanned the flame of their own wrath than nursed it to keep it warm. If they transfer their attacks from the platform to the House of Commons, they will perhaps feel the inconvenience of having said beforehand in the most exaggerated language all that they can repeat in the unwelcome presence of adversaries who will for the first time have an opportunity of answering them to their faces. They will scarcely find a hearing for the thrice-told tale of the alleged miscarriage of the Ministerial policy in Europe. Mr. GLADSTONE himself will hesitate before he appeals on the question of the Berlin Memorandum to a tribunal which has again and again given judgment against him. He has, indeed, of late more than once admitted that his accusations are directed as much against the House, in which he hopes at the election to reverse the majority, as against the Government which he was formerly in the habit of exclusively denouncing. His followers have dealt too boldly out of doors with the facts of the Eastern question to challenge correction by renewing their statements in the House. Sir W. HARCOURT will not embarrass the future Cabinet, of which, if it attains power, he will be a considerable member, by the levity of such assertions as that Austria is the gaoler of the Slav nationalities. An explanation of the failure of the Greek negotiation with Turkey will be required of the Government. With this exception, Parliament in its last Session will probably enjoy almost total exemption from the controversy which for two or three years engrossed its attention.

The Government will with better reason be required to explain and defend its colonial and Indian policy; but it may perhaps be necessary to decline the immediate discussion of questions which are not ripe for final decision. It is impossible to gratify the legitimate curiosity of Parliament without furnishing the same information to possible or actual enemies; and it is not desirable to force the Government into the disclosure of purposes which it may be hereafter necessary to modify. It would be especially inexpedient to elicit a Ministerial confirmation of Sir GARNET WOLSELEY'S announcement that the maintenance of English sovereignty in the Transvaal is irrevocable. There is reason to hope that any discussion which may take place on South African politics will not be a party struggle. The Opposition, and perhaps the Conservative party, will be subject to internal divisions. Mr. FORSTER and Mr. COURTNEY have already engaged in a preliminary skirmish on the retention of the Transvaal. The reports which have since arrived of the meeting of the Boers at Pretoria will supply additional arguments on either side. The odd menace of expulsion or social excommunication of the English inhabitants shows on one hand that the Dutch farmers are in earnest, but it also suggests the necessity of guarding the rest of the population against their possible use of absolute power. The debates which may arise in the House of Lords will be perhaps still more interesting. Lord CARNARVON must either vindicate the annexation of the Transvaal or admit an error for which he would be principally responsible. Lord KIMBERLEY on behalf of the late Government will not deny that he concurred in the policy of annexation, of which indeed Mr. COURTNEY was at the time the only active opponent in either House. It is not likely that Mr. GLADSTONE will repeat in Parliament his preposterous assertion that the Government has, through habitual antipathy to freedom, wantonly established despotic government in the Transvaal. Even the wildest animosity is sometimes checked by the knowledge that an outrageous charge will be refuted on the spot; and Mr. FORSTER may remind his impetuous colleague that there are some thousands of natives to be considered as well as the malcontent Boers. It is true that, as Mr. COURTNEY says, the argument founded on the rights of the natives is an afterthought, or a consideration arising since the time of annexation; but, although it may not have been the duty of the English Government to protect native inhabitants of a foreign possession, all persons who have even for a day been subjects of the English Crown may have acquired a right to protection.

It will perhaps be still more difficult to state the intentions of the Government on the more important question of Afghanistan. Whenever there is a war its political consequences must be more or less dependent on military success or failure. Disaffected and hesitating chiefs will wait anxiously for any declarations of the Government which may throw light on the comparative advantages to be gained by resistance or submission. It may not be desirable to inform the rulers of Herat whether they are to be attacked or left to themselves; and it may perhaps not even have been possible to decide on the relations which are to be established for the future between the Afghans and the Indian Government. It will be well to take the earliest opportunity of correcting the newspaper reports of wanton executions. The Government will scarcely be weak enough to surrender by any Parliamentary pledge the indispensable power of excluding military correspondents or of subjecting them to necessary control. One of the first communications which were allowed to pass when the censorship was withdrawn informed the enemy, truly or falsely, that Sir F. ROBERTS was in want of ammunition. The habit of furnishing full and interesting information is incompatible with patriotic reticence. The historical part of the Afghan controversy is almost as obsolete as the Berlin Memorandum. For practical purposes the policy of the Government begins with the arrival of the Russian Mission at Cabul, and the repulse of the English Mission from Ali Musjid. It will not even be easy to interest Parliament in the disputed question whether the refusal of the Afghan officer in charge was more or less courteously expressed. Mr. GLADSTONE characteristically describes Lord JOHN MANNERS'S opinion that there was cause for offence as a gross and flagrant falsehood; but allowance is always made for the language of uncontrollable passion. Notwithstanding the extravagant abuse of the Government by the more violent members of the Opposition, everything which has been done by the VICEROY since the first declaration of war has been justified by obvious political and military necessity. The advance of the army through the passes led to the Treaty of Gundamuk, which the Ministers rightly described at the time as a wholly successful result. Their adversaries have loudly exulted in the unfortunate events which followed; but they would

find it difficult to persuade Parliament either that peace ought not to have been made, or that the war ought not to have been resumed when the treaty was treacherously violated. On this and on other points the true line of defence of the Government is indicated in a singularly able speech, since published in the form of a pamphlet, which Mr. BALFOUR some time since addressed to a Conservative meeting at Edinburgh.

The financial business of the Session will not be unimportant, and it is understood that the CHANCELLOR OF THE EXCHEQUER will take an early opportunity of explaining his financial policy. The legislative energies of the Government will be best employed in passing the Criminal Code which the ATTORNEY-GENERAL unwillingly postponed in the last Session. Lay members will not view with favour the efforts of professional critics to prevent the introduction of a great and useful reform on the ground that it is not theoretically and minutely perfect. If the Bill is passed, with or without amendment, it will form an invaluable model for codes which may simplify more abstruse branches of the law. It is fortunate that the conduct of the Bill will be in the hands of an eminent lawyer who is thoroughly in earnest in his desire to pass it. All anticipations of Parliamentary proceedings in legislation or policy are unfortunately contingent on the ability of the House of Commons to exercise its functions. The Irish malignants have already threatened to impede or prevent the transaction of business until demands which they know to be impracticable are conceded by Parliament. It will of course be proper to pay serious attention to any measures which may be suggested for the relief of Irish distress; and it is not impossible that the Ministers may require a Bill of Indemnity for some of the remedies which they may have applied. Projects for exempting tenants from liability to rent, and for the wholesale conversion of occupiers into owners, though they cannot be seriously entertained, may probably serve as occasions for obstruction. The experience of late Sessions proves that efforts to render Parliamentary government impossible can neither be safely despised nor easily counteracted. The Ministers may perhaps derive some consolation for the annoyance which they will share with the House of Commons in the disgust and indignation which will be excited against the probable allies of the Liberal party at the next election. At Sheffield the Irish Home Rulers voted for a follower of Mr. GLADSTONE who had expressly rejected their overtures. Sir W. HARCOURT at Oxford paid significant compliments to the faction, which seems likely to resume its former political connexion. It may perhaps not be for the interest of candidates who rely on the Home Rule vote in English towns that the obstructives should immediately before the dissolution have made themselves universally odious.

THE DE FREYCINET MINISTRY.

M. DE FREYCINET'S Ministry will, to all appearance, be M. WADDINGTON'S, written a little larger. It will be quite as much distrusted by the extreme Left, and somewhat more distrusted by the Left Centre. By way of compensation, it will find a more decided support among the deputies of the advanced Left. Too much store, however, must not be set even on this gain, for the efforts that are being made to construct a homogeneous majority out of the advanced and the pure Left are said to be destined to failure, by reason of the unwillingness of the advanced Left to separate themselves definitively from the extreme Left. In that case, the new Ministry will run just the same risks as the Ministry it has displaced. It will continually have to be calculating whether the divisions known to exist among its adversaries will more than balance the divisions suspected to exist among its friends. It is not likely that it will be beaten by a direct vote; but, after recent experience, this prospect yields but scanty comfort. M. WADDINGTON was never beaten by a direct vote, but he had to leave office all the same.

The declaration which M. DE FREYCINET read in the Senate and in the Chamber of Deputies at the end of last week was framed on the principle of saying as little as possible that could compromise or commit its authors. The policy of the late Cabinet is to be carried out with an additional spice of vigour. There are to be rather more dismissals in the public offices, and the reactionary element in the magistracy is to be definitively got rid of. This is to be effected by a device which has the merit of not attacking the principle of irremovability. The judges are to hold their offices by the same tenure on which they hold them now; but the Government has suddenly discovered that there are a great many more judges than are wanted, and that, in deference to a sound economy, a certain number of them must at once be suppressed. The natural way to do this would be to appoint no more judges until successive deaths have brought down their numbers to the desired point. Inasmuch, however, as death cannot be trusted to take off Legitimists and Bonapartists and to leave Republicans alone, the process of reduction is to be undertaken by the Government. It must be supposed that by a fortunate coincidence the number of magistrates needed for the due administration of justice is identical with the number of magistrates whose political principles are of the right sort. When the cumberers of the ground have been got rid of, there will remain just as many vigorous young saplings as are needed to do the work of the courts. It will be curious if, before the end of the year, it should be found necessary to raise the staff to its old numbers. To get rid of a judge you dislike without trenching on the principle that judges hold office during good behaviour would be a triumph of political ingenuity, if it could be repeated whenever it is convenient. As a certain minimum allowance of judges is indispensable to the business of the country, the experiment is probably about to be tried for the first and last time. If its real object were the same as its professed object, its success might be less doubtful. To remove from the Bench any magistrates who allow their political sympathies to warp or colour their administration of justice would be easy enough; but there is no reason to suppose that so modest a measure would at all answer the purpose for which a purification is demanded. That purpose is probably the far more essential one of providing places for Republican seekers for office; and a judge's political antecedents must be remarkably pure if it cannot be shown that his post would be better filled by an advanced Republican. So powerful a bureaucracy as that of France will fight stoutly against the application of the American principle of dividing the spoils at the accession to office of each new Ministry; but, to all appearance, it will fight in vain.

The only question that can be said to divide public attention with the reconstitution of the civil service is the war which the new Cabinet seems resolved to wage with the Church. M. FERRY has introduced another Education Bill, which aims at rendering to elementary education, the same service that his former Bill proposed to render to superior education. The difficulties which this second scheme may encounter are of a more serious kind than those which await the Bill which has been made famous by its seventh clause. The Government propose to secure freedom for the higher education by the simple process of closing the schools which they dislike. Superior education is self-supporting. The parents pay for it; and, as for their own sakes they will wish their sons to have it, they may be trusted to pay for it in the State schools, provided that they can be prevented from paying for it in clerical schools. Elementary education, on the other hand, is not self-supporting, and if the question is left to the decision of the parents, there is not much doubt what their choice will be. If they are not allowed to send their children to such schools as they like, they will certainly not pay money to send them to schools which they do not like. A system of education which is to drive the Church out of the field must not be content with providing a lay school in every commune, or even with shutting up every clerical school. It must make attendance at the lay school compulsory; and, in order that the change shall not be dangerously unpopular, it must ensure that this compulsory attendance shall cost the parent nothing. It is a point of some interest to know in what way a scheme of this kind will affect the French taxpayers. On the one hand, the cost will be very great. Englishmen are feeling something of what the expense of education means, though with us compulsion is nothing like universal, and the schooling is in part paid for by the parents. In France compulsion is to be universal, and the parents are to pay nothing. Under this system it is safe to predict that that cheapness which Mr. ARNOLD not long since recommended to our imitation will quickly disappear, and the outlay per child will rapidly rise to those more magnifi-

cent proportions with which we are familiar in this country. It might seem that this is a change which so frugal a nation as the French will greatly dislike; but against the cost, which will certainly not please them, must be set one or two counter considerations. In the first place, the Bill will create a great number of new posts, and the active goodwill of expectant officials may go some way to make up for the passive dislike of the people who will have to find their salaries. In the next place, the French are accustomed to have a great deal done for them by the Government, and provided that they see and feel that something is being done, they may not be very keen to realize that it is being done for them at their own expense. In the present case they will see that their children are being educated for nothing; and to parents the benefit of this process, while it lasts, will greatly outweigh the loss they will sustain as taxpayers.

The Extreme Left seem likely to be gratified by the revival of a regulation dating from 1830, which directs the military authorities to address all officers as "Monsieur," with the title belonging to their professional rank. General FARRE, or one of his subordinates, has acted upon this rule, and directed a letter to "M. le Général d'AUMALE." This is a very small advance towards that true Republic under which he would be addressed as "General H. CAPET"; but still it is an advance, and as such the extreme Left are pleased and the advanced Left profess to be pleased. It may be taken for granted that men like M. GAMBETTA and M. DE FREYCINET are perfectly aware of the imprudence of alienating moderate politicians from the Republic by devices which only serve to show how many Frenchmen still set a value on titles of nobility. The Duke of AUMALE will be no sufferer by this official cancelling of his ordinary designation. Whether General FARRE calls him what the rest of the world call him, or revives a designation which will never be used outside the War Office, he will still be a great noble and a prince of the blood. But the fact that M. GAMBETTA and M. DE FREYCINET make themselves parties to petty insults of this kind is all the more significant because they cannot really approve of them. It shows the singular bondage to the extreme Left into which the French Government is falling; a bondage which has not even the advantage of entailing protection on the part of the master. The more the distinction between M. DE FREYCINET and such men as M. CLÉMENCEAU, M. BRISSON, or M. MADIER DE MONTJAU—who is now one of the Questors of the Chamber of Deputies—is accentuated the more persistently the extreme Left will ask, Why do we govern France by our agents? if these men are only our servants, let us send them about their business and do the work ourselves.

PLAIN WHIG PRINCIPLES.

A SOLEMN protest in the *Edinburgh Review* on behalf of "plain Whig principles" is unintentionally amusing and indirectly instructive. The moderate Liberals, some of whom perhaps still call themselves Whigs, are with good reason alarmed and offended by the violence of Mr. GLADSTONE and his congenial followers. Sooner or later they will be compelled either to swallow their conscientious scruples or to secede from a party which threatens to become revolutionary. In the meantime, a writer who represents the most ancient and orthodox section of their body only calls attention to the weakness of the Whigs when he endeavours to reassert their ancient supremacy. Although it is certain that the progress of democracy can only be arrested, if at all, by the union of those who wish to maintain the existing Constitution, the *Edinburgh* Reviewer anxiously repels the alliance of the former adversaries of his party. On the issue which will decide the general election he echoes with servile imitation the phrases of Mr. GLADSTONE and Mr. CHAMBERLAIN. It is not long since the *Edinburgh Review* denounced with argumentative vigour the Bulgarian agitation and the support which was given by violent Liberals to Russian aggression. It appears that plain Whig principles now include apprehension of personal government, and objection to an imaginary policy which is called Imperialism. If plain Whigs are really opposed to the foreign policy of the present Government, their co-operation with the Radicals will not be less welcome because they are not reconciled to the Birmingham form of government, or to the abolition of the Establishment. The article begins with a quotation from a letter in which Lord RUSSELL, then far advanced in years, foretold the reconstitution of the Liberal party on Whig principles. It is interesting, but not surprising, to find that the typical representative of the party still recited in the decline of his faculties the formula which had served him for a creed through life. Unfortunately there is no indication of any revival of the Whig organization. The Duke of SOMERSET, long known as one of the ablest of the Whig aristocracy, has lately published a confession of political despair; and the younger members of the party are content to exchange the influence of rank and title for the permission of Liberal election managers to represent the opinions of Radical constituencies. If Mr. FITZWILLIAM shares the opinions of the head of his family, he must differ from his intended colleague on almost every question of foreign and domestic policy. The Whig candidate is more likely to be drawn into the current of political change than the Radical to be hampered by the scruples of the Whigs.

The Whigs, when they existed, were often and justly compared to the Left Centre of French Assemblies. A long quotation in the *Review* from one of Mr. BRODRICK's valuable pamphlets contains the statement that in France "the "Extreme Left has proved itself greatly inferior to the "Left Centre in the higher political virtues." He adds that Mr. GOSCHEN, Mr. CHILDERS, Mr. FORSTER, and Mr. STANSFELD belong to the English Left Centre, and that "to drive them into becoming the left wing of the "Right Centre would be an act of political suicide worthy "only of Spanish revolutionists." It is unnecessary to inquire whether Mr. FORSTER and Mr. STANSFELD are properly classified as belonging to the English Left Centre. There is at present no question of excluding from the Liberal party those who share their opinions. Even the Whigs are for the moment tolerated, if they consent, with the *Edinburgh* Reviewer, to pronounce the shibboleth of Imperialism and turbulent foreign policy. As soon as they attempt to assert their independence, they will be repudiated by their Liberal allies. In the days of LOUIS PHILIPPE it was a commonplace saying that France was Left Centre. A modified form of the same doctrine was at a later period propounded by M. THIERS when he declared that the Republic was the form of government which divided Frenchmen the least. The Left Centre, with its political virtues, is now relegated into insignificance, after governing France for a year. The Republic, instead of uniting parties, has both multiplied factions and rendered them more utterly intolerant of one another. Extreme democracy is advancing with rapid strides; and successive Ministers struggle in vain to check, by alternate resistance and compliance, the irresistible pressure which urges them forward. The great difference between the two countries is that there is still in England a Conservative party which has not, as in France, retired in hopelessness from the political conflict. Plain Whigs and Moderate Liberals cannot dispense with the aid of the rank and file of the constituencies. Their political virtues will not avail them at elections. They have hitherto allowed themselves to be directed by the extreme members of the party; and if they ultimately rebel against their imperious associates, they must look for support in some other quarter. It unfortunately happens that almost all moderate Liberals belong to the educated classes, and that they are therefore a fraction of a small minority. Demagogues not unfrequently affect to deny their existence, because their numerical strength bears no proportion to their moral and intellectual superiority.

While the Left still recognizes its Centre, it is for party purposes extremely convenient to appeal to the constituencies on questions of foreign policy which would have been little understood even if they had not been obscured by violence and misrepresentation. The purist of the *Edinburgh* is apparently ready to vote for candidates who will repeat the popular clamour against the Berlin Treaty and the Afghan war. Those who agree with him well know that the questions in dispute have little or nothing to do with political principles; but a majority returned to support Mr. GLADSTONE's views on foreign politics would survive to render practicable the revolutionary changes which he has at various times threatened. The introduction of universal suffrage, the destruction of the Established Church, instalments of Home Rule, and perhaps the com-

pulsory expropriation of landowners would be practical, if not logical, consequences of a decision that the Afghan war was unnecessary. It may be that, as the *Edinburgh* Reviewer asserts, the Church of England is in no danger from the Whigs; but the danger which impends over the Scotch Establishment commenced with Lord HARTINGTON'S wanton declaration. The Whig leader of the Radicals at the same time announced that he would not be deterred from an attack on the Scotch Establishment by any consideration of the effect which might be produced on the Church of England.

The advocate of plain Whig principles evidently believes, not without reason, that Mr. GLADSTONE is the most formidable opponent of his opinions and of the party to which he imagines himself to belong; yet, by way of conciliating the evil influence, he actually expresses a hope that Mr. GLADSTONE will be the next Chancellor of the Exchequer. A Prime Minister of moderate opinions, with the revolutionary leader under his nominal command, would occupy a ridiculous and helpless position. Mr. GLADSTONE has always, and especially in his late speeches, either of set purpose or through imperfect appreciation of logical distinctions, confused politics with finance, as when he declared that the *Alabama* payment was an extraordinary charge, but that the cost of preparations against Russia was a burden properly belonging to the year in which it was incurred. From the vantage ground of the Exchequer Mr. GLADSTONE would dictate to his unequal colleagues their domestic and especially their foreign policy, on the ground that all measures must be considered with reference to their cost. He has always inclined to follow the example of PERCEVAL, who attempted to put Lord WELLINGTON on an allowance, which he was not to exceed, in the conduct of the Peninsular war. Should Mr. GLADSTONE take office in a Government which, if it is formed, will owe its existence to his efforts, he ought to be its chief in name as well as in reality. Three or four years of his administration, which would be directed to the overthrow of the principal institutions of the country, would, whatever other results might follow, put an end to plain Whig principles, and especially to the principle of the divine right of the Whig aristocracy. The decay or extinction of a great historical party is greatly to be regretted; but it is useless to rely on forces which have become obsolete. The epitaph of the party is contained in the Duke of SOMERSET'S exposition of the doctrine of political pessimism. The utility of his book may be reasonably questioned; but some critics will feel a certain sympathy with a writer who appears to have no object except to say what he thinks. Some men of ability speak and write with the object of securing partners in their discontent. If the Duke of SOMERSET is troubled with disagreeable reflections, he is apparently not unwilling that his readers should share his dissatisfaction with limited monarchy, with public meetings, and with democracy.

BIRMINGHAM LIBERALS.

THE inhabitants of Birmingham know their own business best, though strangers might have supposed that no community was less in want of a new Liberal Club. The town is already club-ridden in all its political and municipal affairs; for, by dint of careful organization, the numerical majority effectually excludes the most wealthy and most highly educated part of the population from any share in the management of the common interests. In that happy place taxation and representation are wholly separated. Probably the object of instituting a new Liberal Club is to divide society, in private as in public, into two separate and unfriendly classes. Even in London there is only room for two or three political clubs, while in provincial towns merchants and manufacturers, and residents in the adjoining districts, find it convenient to meet one another as neighbours rather than as partisans. The dominant party at Birmingham, preferring that faction should affect all the relations of life, are perfectly entitled to seclude themselves from all society in which they could learn anything new. To cultivate prejudice and to avoid all risk of instruction is to ordinary minds a condition of that part of happiness which depends on self-complacency. To a body of steady believers in party no opening ceremony could be more acceptable than the delivery of such speeches as those which might be anticipated from Sir W. HARCOURT and Mr. BRIGHT at the dinner of last Tuesday. The orators of the day were in the highest degree unlike one another; and among them they represented with perfect fidelity the tastes and sentiments of Birmingham politicians.

The first speaker probably regards local organization as a serviceable instrument in the great task to which he devotes his energies with an entire absence of fanaticism. Sir W. HARCOURT could not but approve of an institution which might facilitate the management of elections, unless indeed he reflected that Mr. CHAMBERLAIN and his Liberal Association are more than competent to do all the party work which can be needed at Birmingham. Independently, however, of political considerations, it might be worth while to belong to a Liberal Club if the subscription entitled members to the privilege of hearing many speeches as brilliantly amusing as Sir W. HARCOURT'S. His epigrams were never more sparkling, nor his gaiety more unflagging. It is satisfactory to be assured that one at least of the leaders of Opposition is not in the smallest degree depressed by the complicated misfortunes which have followed and illustrated the unprecedented crimes and follies of the Government. If a figure of speech may be borrowed from an orator who can well spare materials of plagiarism, the Liberal orators have two bogeys in the domestic and foreign policy which they incessantly denounce; but Sir W. HARCOURT does not seriously affect to be frightened by either spectre. He indeed anticipates with pleasure the opportunity of proving that the CHANCELLOR of the EXCHEQUER, or, in other words, the country, is in a bad financial condition; and he reached the climax of hilarity when he quoted from a newspaper correspondent a lugubrious statement of the difficulties encountered by the English army in Afghanistan. There was a certain want of skill in the confession made in the latter part of the speech that the orator had been, as he professed, unconsciously jocular. Humour, said Sir W. HARCOURT, is the juxtaposition of incongruous ideas, and it necessarily arises from a comparison of the performance of the Government with its pretensions. "No doubt nothing "can be more incongruous than that; but then the "humour of the situation is their creation and not mine." SHAKSPEARE'S jesters were familiar with the trick of attributing to the objects of their ridicule the merit of their own satirical humour. The fool offered King LEAR his bauble, on the ground that in giving away his kingdom he was the greater fool of the two. It would, for rhetorical purposes, have been better to affect unbroken gravity than to have made an apology for witty buoyancy of spirit; but, unless the Liberals of Birmingham have become dull under the constant pressure of political agitation, they will not have been disposed to criticize the liveliest and pleasantest of recent public speeches.

Mr. BRIGHT, though he also has great command of humour, only indulged in a few incidental sarcasms. The most remarkable quality in his speech was the freshness which he contrived to impart to the fiftieth or hundredth repetition of his well-known discourse on the past merits and achievements of the Liberal party. It cannot be denied that the topic was suited to the occasion, for the members of the Liberal Club might properly wish to be persuaded, if they were not fully convinced already, that the party which they propose to cement by additional ties has in former years done invaluable and exclusive service to the country. As almost all of them must have heard Mr. BRIGHT'S former speeches, they probably welcomed the mention of the Test Act and of Catholic Emancipation with the pleasure which a dramatic audience finds in the production by a favourite actor of his familiar points. There is after fifty years not much difference of opinion as to the justice and expediency of having removed an offensive disqualification imposed on the members of one particular sect; but, if modern Liberals would reflect on their own subsequent conduct, they might begin, in spite of Mr. BRIGHT, to suspect that the laws against Roman Catholics were not exclusively maintained by the prejudices of a bigoted aristocracy. Since the repeal of Catholic disabilities, and more especially since the so-called Papal Aggression, it has been almost impossible for a Roman Catholic to enter the House of Commons as representative of any constituency in Great Britain. Lord EDWARD HOWARD sat for the family borough of Arundel until it was disfranchised; and the popularity of Sir JOHN SIMEON in the Isle of Wight prevailed for a time against religious prejudice; but there

have been but one or two other exceptions to the practical continuance of the disability which was thought to have been removed in 1829. After the Test Act and the Emancipation Act, M. BRIGHT's audience expected with just confidence the usual quotation of the Duke of WELLINGTON's rash expression of his simple belief in the absolute perfection of the Constitution as it then existed. CANNING had repeatedly said the same thing in more ornate language without forfeiting the confidence of many who are still counted as Liberals. The DUKE displayed a want of judgment and foresight in failing to discern the change of opinion which had been for some time proceeding, and which was suddenly accelerated by the French Revolution of 1830. Whether his undoubted liability to error is at the present day very instructive may reasonably be doubted. It is known that the Duke of WELLINGTON was not even aware, until he was surprised by the remonstrances of his friends, that he had said anything remarkable or imprudent. All the Tories and nearly all the Whigs had held the same belief during all his political life; and he had sincerely shared the common opinion. The inference from his miscalculation is that political changes are sometimes desirable, and not seldom unavoidable. That change is always expedient is a much more questionable generalization, though it is suggested by Mr. BRIGHT.

Sir W. HARCOURT, who accurately describes himself as a moderate Liberal, announced with an affectation of cheerful surprise that he was not frightened by Mr. CHAMBERLAIN. He is probably still less suspicious of any revolutionary tendencies in Mr. BRIGHT. Mr. CHAMBERLAIN himself confirmed the statement that the Liberal party is for the present united; and indeed the common ground of action is admirably simple, inasmuch as it consists in a determination to turn the present Government out of office. Mr. GRANT DUFF, speaking on the same day, protested against the demand that the Opposition should propound any policy of their own; yet it is a question of some interest whether a Liberal Government will represent the policy of Sir W. HARCOURT or of Mr. CHAMBERLAIN. It is not a sufficient answer to reasonable inquiries that Lord GRANVILLE is personally responsible for the foreign policy of the Liberal party. Lord GRANVILLE has never pledged himself to the proposition that the complications which have arisen in Eastern Europe or in Asia could have been avoided. If he succeeded to the administration of affairs, he would probably abstain as far as possible from action in Turkey, and he would, like the present Government, prosecute the war in Afghanistan exclusively for the purpose of obtaining a safe and honourable peace. The differences of parties on foreign politics are essentially occasional and transitory. There is nothing Conservative and nothing Liberal in the Afghan war; but the largest political issues are raised by Mr. GLADSTONE and by the extreme section of the party. Mr. CHAMBERLAIN, with perfect fairness, reserved to himself the right of obtaining proselytes to his own advanced doctrines. He will not rely entirely on his powers of persuasion. The Liberal Associations which are spread over the kingdom will, if they succeed, effect a more organic change in the Constitution than any of the measures which were recapitulated by Mr. BRIGHT.

DEMOCRACY IN VICTORIA.

MR. BERRY seems no longer to hold that supreme and unquestioned position in the Victorian democracy which he attributed to himself when in England. He has not secured an absolute majority for his Reform Bill even in the Legislative Assembly, which had been supposed to be entirely under his control, and he has now appealed to the constituencies to say whether they are prepared to force the proposed new Constitution down the throats of the Legislative Council. The result of the election will be a very fair test of the common sense of the electors. That they should desire a reform of the Constitution is natural enough. They have to wear the shoe, and it is for them to say whether and where it pinches. The difference between wisdom and folly in controversies of this kind is not merely that the wise man proposes wise changes, and the foolish man foolish changes. It lies in this more perhaps than in anything else, that the wise man sees when there are more ways than one of getting his object, and chooses out of them the way that is likely to irritate his opponents the least. Mr. BERRY has taken the very opposite course to this. He has apparently framed his Reform Bill on the simple plan of putting into it everything which the Legislative Council would most like to keep out of it. It is hardly denied, even by the most obstructive members of the Council, that some modification of their powers is demanded by the circumstances of the colony. The Upper House of the Victorian Legislature now wields powers greatly exceeding those which are wielded by the English House of Lords. Both these bodies possess the theoretical right of rejecting any measure that the Lower House may send up to them. The difference is that in one this right is waived, while in the other it is exercised. As soon as the House of Lords has satisfied itself that the House of Commons has determined that a particular Bill ought to pass, and that it is supported in this determination by the constituencies, the House of Lords takes care to give way. Had the Council of Victoria been equally well advised, no serious quarrel need have arisen; and had Mr. BERRY confined himself to discussing remedies for this inconvenience, no one could reasonably have blamed him. The utmost that a Second Chamber can profitably aim at accomplishing is to give the public time to see the real meaning of the measures which the popular Chamber wishes to see adopted. Its veto, to be useful, must be in fact, whatever it may be in name, a purely suspensive veto. Provided that this limitation is well understood, it is probably better that it should not be expressed in the Constitution. There are changes which people do not care enough about to force them in the face of a possible quarrel between the two branches of the Legislature, though they would insist on them if there were any legal means of over-riding the vote of the Upper House. If however, this limitation is not properly understood, there may be nothing for it but to put it into words. Mr. BERRY contends that this necessity has now arisen in Victoria, and, whether he be right or wrong in thinking so, it is not a point upon which the judgment of home observers is likely to be worth much. But the manner in which Mr. BERRY has framed his Reform Bill is a point upon which every man may have an opinion. The proposed resort to a *plébiscite*, the substitution of a nominee for an elective Council, and the denial to the Council of any voice in the expenditure of public money, are points which, quite apart from their own intrinsic demerits, are objectionable as being needlessly revolutionary. The weak point in the present Constitution is the absence of any provision for settling in the last resort differences between the two branches of the Legislature. In order to remedy this, Mr. BERRY is determined to destroy Parliamentary government. If the Victorian electors have any political aptitude, they will decline to blow up the house in order to make a door through a particular piece of wall.

Mr. BERRY and his colleagues are evidently suffering the usual evils of prolonged political excitement. When a Prime Minister allows himself to talk about bringing a considerable branch of the Legislature "under the heel of "authority," he has either lost his temper or thinks it expedient to pretend to have lost it. Speeches of this kind either defeat their professed purpose or go immensely beyond it. If the electors of Victoria are less Radical than Mr. BERRY thinks them, they will prefer to entrust the negotiations for constitutional reform to a Minister who is a little less committed to the rejection of everything short of the whole loaf. If their Radicalism fully comes up to Mr. BERRY's calculations, it may not be long before some younger demagogue begins to talk of bringing Mr. BERRY himself under the heel of the authority which he has invoked. The people of Victoria will display an ignorant patience of taxation which would shock Mr. GLADSTONE if they support a Government which declares that what it wants "is to get at the public purse in a free, "easy, and accessible manner." A more candid admission of a desire to have a finger in other people's pockets has seldom been made. No doubt in Victoria, as elsewhere, there is a section of the community which would like to feel, with another Minister, that they have their hands on the throat of capital. But capital is quickly gained in the Australian colonies; and it is possible that Mr. BERRY has underrated the hostility of the men who look forward to becoming wealthy to legislation which would aim at giving their riches wings.

The Legislative Council have now an opportunity of showing that the lessons of the last twelve months have

not been lost upon them. The leader of the Conservatives in the Assembly has indicated what, in his judgment, would be a reasonable settlement of the questions in dispute between the two Chambers. He would first diminish the probability of a dead-lock, by making the Council a more popular body; and he would meet the possible failure of this expedient by a provision that when, after a dissolution of both Houses, no arrangement could be come to between them, the questions at issue should be decided by a joint vote. In this way the wishes of the popular House would be sure to be carried out, unless the majority in their favour were too small to overcome the opposite majority in the Upper House. It is safe to say that the community would not suffer if a change which failed to command this amount of popular support had to stand over until a larger proportion of the public were convinced of its necessity. The wisdom of the Legislative Council would now be shown in publishing as widely as possible their readiness to accept a Reform Bill of this kind. Whatever there is of moderation or good sense in the colony will thus be enlisted on their side. Mr. Berry cannot deny that this plan would perfectly answer the professed purpose of his Reform Bill; and if he has another and unexpressed motive for bringing forward that singular measure, it is well that he should be compelled to avow it. The Council cannot oppose him so effectually as by letting their own moderation be known of all men. In proportion as the impression that the Council is bent upon retaining the absolute veto which it now has lingers in the minds of the electors, the electors will be disposed to give Mr. Berry the support he asks for; and the more complete that support is, the more difficult it will be to offer any effectual resistance to the constitutional revolution he wishes to bring about. The way to disabuse the electors of any such notion is to repeat, until they are tired of hearing it, that the Council is ready to concede all that is needed to enable the work of legislation to go on smoothly.

THRIFT AND CONSOLS.

The events which have of late kept Lord Derby apart from the ordinary course of political conflict are adding very materially to the list of really good non-political speeches. For the most part, good speeches of this kind are rare. Eloquent men seldom condescend to make them; men who are not eloquent make speeches indeed, but hardly good ones. Lord Derby, whether he is dealing with politics or with any other subject, is not eloquent, but he never makes a bad speech. What he has to say is always excellent—always to the purpose, and precisely expressing the particular shade of meaning he wishes to express. It is really a social benefit to have Lord Derby's powers turned for a time to commercial and economical subjects. He may not always be right in his conclusions—as, for example, when the other day at Huddersfield he unduly depreciated the value of our export trade; but he is always right in his method—always careful, that is to say, to present the really important sides of the subject to his hearers and to send them away with some idea which may bear fruit later on. His speech at Liverpool the other day showed this latter quality in a curiously subtle way. Lord Derby, though he is for the moment unconnected with either political party, has been in this position but a short time, and is not likely to remain in it long. He cannot, therefore, criticize with much freedom acts or omissions of the Conservative Government to which he himself was, in a sense, a party during the years in which he was last in office; and he is probably as unwilling to speak positively of what a Liberal Government ought to do as though he were already a member of Her Majesty's Opposition.

But for this he would no doubt have given a more precise application to his remarks about the distribution of the National Debt and the limitation of deposits in Post Office Savings Banks. What he did say on these subjects pointed very plainly in a particular direction, but he did not state in so many words what this direction was. Indeed he even went out of his way to conceal it. He sees no reason why Savings Banks—it is to be presumed that he is referring to Post Office Savings Banks, as there is a very sufficient reason as regards banks under trustees—should be so closely tied down, both with reference to the amount which any one depositor may hold in them and to the amount which any one depositor may pay in during a year. The two objections usually made to an increase in these respects seem to him of no weight. Savings Banks will never interfere with the business of ordinary banks; and, if they did, why should the State secure ordinary banks a monopoly which would not come to them if people were left perfectly free to place their savings where they like? Nor is he impressed by the danger that, if the State held so much money at call, all the world might wish to draw out their deposits at the same time, and then the State would not have the means of paying them. Lord Derby might have instanced the light which the recent depression has thrown upon this imaginary danger. In England a run upon the State would never be caused by any doubt as to the solvency of the State. It would always be the result of a depression so general and long-continued that no one would have any money to leave in the Savings Banks. If there had been anything in this latter apprehension, some trace of it would have been seen during the last year. The depression which began to pass away in 1879 had been of almost unexampled length, and if ever there was a time when Savings Bank accounts would be likely to show a check in the growth of deposits it is the present. Wages have been low, work has been slack, and as there has been no very large increase of pauperism, the working classes must to a considerable extent have been living upon what they have laid by. Yet the Liverpool Penny Savings Bank Association held at the end of 1879 36,000*l.* more than they held at the end of 1878, and the number of accounts open was increased by 1,700. Probably this is the experience of almost all Savings Banks; and, if so, it suggests, what we believe to be true, that with many people hard times have been treated simply as a motive for more than common economy. People who have not hitherto thought much about laying by money are forced to think of it then. People who have not hitherto thought much about their savings get anxious, and try, perhaps for the first time, to get a little beforehand with the world. For each man who is forced to draw out his savings there is one who strives harder than ever to keep them untouched, or another who is startled into opening an account.

There being no force in the reasons commonly given for keeping down the amount of deposits, there is in Lord Derby's opinion very great force in the commonplace that the more people you interest in keeping things quiet the safer the social system would be. If Lord Derby had meant no conclusion to be drawn from this beyond the propriety of allowing a depositor to hold 500*l.* in all, and to deposit 100*l.* in the course of the year, he would not have spoken the next sentence. "It is rather a trouble-"some business for a poor man who does not employ "a banker to buy into the funds." Undoubtedly it is rather a troublesome business—so troublesome that no poor man is ever likely to make the attempt. But why should it be made troublesome? What is there to prevent Post Offices—or, say, to begin with, the principal Post Office in every town—from receiving small sums of money for investment in Consols? The cost of brokerage, if the existing Post Office servants were the brokers, would be exceedingly small, and, whatever it was, it could be paid by stamps, and be made to include the cost of paying the dividends when the depositor did not prefer to leave them to accumulate. All the advantages that can flow from an extension of the system of Post Office Savings Banks would follow with still greater certainty from the extension of the holding of Consols. The sense of dignity given to the investor—and, by consequence, the sense of participation in the national well-being—would be very much greater, and it would extend to a class which at present is very little affected by appeals of this kind. There are people who are a little above putting money in a Savings Bank, and who, when they have any savings, like to think that they are invested in securities of the same kind as those in which the savings of richer men are invested. They have no opportunity of buying Consols, and the consequence is that they often fall a prey to some high-sounding and fairly promising concern which is perfectly ready to take their money in whatever way is most convenient to them. If they could invest it in Consols with no more trouble, they would in many cases be quite willing to do so. The superiority of Government security is not unappreciated by any class in the community; it is when they

have to decide between private securities, all professedly offering the same prospect of repayment, and only differing in the amount of interest, that the risk of being led astray becomes so great.

What is there to prevent the means of investing money securely from being brought to everybody's door? It has been done in France, and done with most excellent results. That the opportunity would be used if it were offered cannot be doubted. The statistics of Savings Banks deposits are conclusive on this point. No doubt there are a considerable number of depositors in Savings Banks who look upon their deposits as something in the nature of a current account, and draw out and pay in with a frequency which could not be applied to the purchase and sale of Consols. But, on the other hand, there are large numbers of depositors who treat their savings strictly as an investment for old age or accident, and to whom Consols would answer all the purposes of a Savings Bank. When to these are added the class which does not use Savings Banks, but might, and probably would, buy Consols, the number of probable investors becomes large enough to satisfy the most exacting Chancellor of the Exchequer. Why is it that even Lord DERBY seems unwilling to say that the purchase of small sums of Government stock ought to be made as easy as the obtaining a Post Office order? Whatever may be his reason for not putting it into words, there can be no question that this is the obvious moral of his speech. In the Conference on Thrift which is to be held next week at the Mansion-house it is to be hoped that this important side of the subject will not be passed over.

PRIVATE LUNATIC ASYLUMS.

THE South London District of the Metropolitan Counties Branch of the British Medical Association is a body which cannot be complimented upon possessing an elegant title, but it was engaged last Wednesday night in the discussion of a subject of very great public importance. In a meeting, held appropriately enough at Bethlehem Hospital, Dr. BUCKNILL, who is known as an active theorizer as well as a practical expert in the matter of mental diseases, brought the subject of private lunatic asylums before his fellow-members of the Association. The Lunacy Laws have always been a much-debated subject, and not a few cases of late have served to turn public attention once more to them. The propriety and sufficiency of the regulations actually in force have of themselves afforded matter for controversy sufficiently warm. But there has lately been added a considerable suspicion as to the actual observance of these provisions. In a famous case which was heard immediately before and immediately after the Long Vacation, the Judge noticed, and expressed his displeasure at noticing, that the legal formalities of the medical examination had been by no means punctiliously observed. This very week another case has been heard and decided which shows how easy it is to elude even the not very stringent provisions which at present limit the power of incarceration. A person was charged with receiving lunatics as "hysterical patients," and the charge was held to be proved, though no actual misconduct appears to have taken place. Such facts as these, and others which are constantly occurring, serve to keep up the indefinite feeling of uneasiness which exists on the subject. No sensible person supposes that the practices of brutal ill-treatment of lunatics, or of wrongful incarceration of sane people from interested motives, exist on any great scale. But it is felt that, as the law stands, there is not sufficient safeguard against the occurrence of such things, though it may be only in rare and isolated cases.

Dr. BUCKNILL's address was devoted chiefly to the subject of private asylums, the question of certification, which is perhaps of even more practical importance, being dismissed as too large for immediate handling. The speaker took very high ground in his condemnation of the institutions he attacked. He asked his audience whether they considered it right "that diseased and helpless persons should "be confined in asylums for the profit of individuals." As the audience seems to have consisted in no small proportion of the proprietors of such asylums, it is not surprising that several of them declined to give the expected answer to the question. Speaker after speaker rose and objected. One gentleman went so far as to say that there was no such a thing nowadays as the detention of sane people in lunatic asylums. Another protested against "clap-"trap and scurrilous articles" on the subject. But, though the discussion excited so much interest that it was adjourned to admit of more thorough treatment, it does not seem that any one really attempted to examine Dr. BUCKNILL's proposals. These were sweeping enough. The entire abolition of private asylums, the consolidation of all power over lunatics in the hands of the Local Government Board for paupers, and of the Lord Chancellor for persons of property, were some of the demands of this thoroughgoing reformer. Unfortunately his suggestions seem to have been not a little tainted with the spirit of over-generalization by which thoroughgoing reformers are not seldom led astray. We have quoted one of his phrases; here is another:—"It might be very con-"venient to the Commissioners that lunatics should be "gathered together in large herds or groups, but it was "not to the advantage of any one except the cus-"todians." Here we have evidently got into quite a different region from that of the axiom that no private individual ought to make profit out of diseased and helpless persons. This latter, if it is to be taken as having any weight at all, simply means that not only the function of guarding lunatics, but all sorts of other functions, must be taken up by Government. We must abolish private schools, private hospitals, private legal and medical practitioners, and so forth. Reforms urged on principles of this kind are not likely to find wide acceptance; and, had the private asylum keepers been wise, they would have rejoiced to see their enemy adopting such a line of argument. As for the other remark, about lunatics in herds, it seems to be founded on some theory of the treatment of the insane for which we doubt not that Dr. BUCKNILL has plenty to say, but which is evidently a matter for expert argument, and can hardly, as thus enunciated, be considered a valuable contribution to the general discussion of the question. If it means anything, it is as decisive against the large public asylums, of which most people approve, as against the large private asylums, of which many people disapprove. It may, in short, be taken as pretty certain that, if the question of reform is to be successfully approached, it must be approached in a different spirit from this.

We do not see that it is at all necessary to make the question purely or mainly one of private asylums *versus* public. The former institutions have indeed certain obvious drawbacks, which the protests to which we have referred by no means explain away. Their existence is, to a certain extent, a survival of the old barbarous practice of "begging fools" of the Crown, and the fact that the interests of their proprietors are directly concerned in detaining their unfortunate guests cannot be ignored or pooh-poohed. But, on the other hand, private asylums are undoubtedly in many cases a blessing both to sensitive patients and to sensitive relations of patients. They admit perhaps of greater individual care than large public institutions, while they are certainly not likely to be supplanted by a large number of small public institutions which would be infinitely costly. The possibility, moreover, of eluding judicious and frequent inspection is, or ought to be, very small. But the great point of importance is that no person shall be sent to these establishments or to any establishments who is not a lunatic, and it is this point upon which at present public opinion is dissatisfied. It is a truism (though one the truth of which the proprietors of lunatic asylums are naturally loth to admit) that with a large class of persons to send them to a madhouse is to ensure that in a very short time they shall be genuinely mad. How to obviate this danger is the *crux*. The problem has at present been solved in a sufficiently English fashion by avoiding its solution altogether. The present system of certification is about as rational, and may be as effective, as the application of Mr. Justice BRIDLEGOOSE's system of dice-throwing would be. Even the emendations in it proposed by the Lunacy Commissioners leave it much as they found it. The mere fact of a man being a doctor in actual practice does not of necessity prove him to possess any acquaintance with the subtle and terrible phenomena of mental disease. On the other hand, justly or unjustly, the lay public have got it into their heads that professional "mad doctors" are not much more to be trusted than the ordinary practitioner whose experience is confined for the most part to whooping-cough and broken heads. The only person who would be really satisfactory as an arbiter of the

liberty or imprisonment of his fellows would be the ideal *Phronimos* of the Greek philosophers, the practically wise man who has neither theories nor prejudices. Unfortunately it is not easy to put one's hand on a few hundred or thousand of such persons at a moment's notice. We have, however, before pointed out that the appointment of official examiners for the purpose of certification would secure at least a reasonable chance of good administration. Despite the very natural outcry of the private lunatic asylum keepers, it is impossible not to feel that what has to be guarded against is much more the interest which in this case may lead a man to do wrong knowingly than the ignorance which may lead him unwittingly into error. In the case of pauper lunatics the eagerness of relations to rid themselves of an expense and a trouble is balanced by the professional interest of the administrators in keeping down expenditure. There is no such balance in the case of lunatics of a higher class. Nor did Dr. BUCKNILL speak a whit too strongly when he said that the deprivation of the liberty of any of the QUEEN's subjects was an affair for the State alone. Unfortunately this truth is fully recognized in theory already, though it is singularly blinked in practice. The certificate, the licensing of asylums, the inspection of them, all vindicate the position of the State amply as far as theory goes. Nor do private asylums of themselves at all infringe this right. The State, with due precautions, chooses to transfer its captives to certain persons, and the only thing to be contended for is that the precautions should be sufficient and that they should be observed. At present it is by no means certain that they are observed, and it is quite certain that they are far from sufficient. It would therefore seem more reasonable that the advocates of lunacy law reform should concentrate their efforts on this point, which is obviously weak, and not unlikely to be successfully assailed, rather than attack another point of some considerable strength. The objections to private asylums could be in a great degree done away with by the adoption of a rational system of certification, while even the abolition of private asylums would not wholly obviate the dangers of the present mode of procuring in the first place the confinement of a lunatic.

THE NEW RULES FOR THE NAVIGATION OF THE THAMES.

IN the year 1878 the total number of sea-going vessels which arrived in the port of London was 47,728, and their aggregate tonnage was 9,415,873 tons. In 1877 the number of vessels was 47,691, the tonnage 9,706,180; and in 1876 the number of vessels was 44,822, the tonnage 9,211,889. These figures, to which we have previously drawn attention, show not only the enormous magnitude of the Thames traffic, but also that during one year of great depression it considerably increased, and that during another year of equal depression there was only a very trifling decrease. With anything like a revival of trade, this huge traffic, which, to use the language of the Thames Committee, "has almost outgrown the "capacity of the river," will be largely augmented, and will outgrow it altogether; and as, unfortunately, the narrow and winding channel of the Thames cannot be widened or made straight, the navigation of it, already extremely difficult, will be even yet more difficult and dangerous. It is abundantly clear, then, that everything should be done that can be done, by the promulgation and enforcement of well-considered rules for the navigation of the river, to diminish the chances of collision, which are now great, and are likely to become greater. Important, however, as is the question of how to regulate the navigation of the river, it might never have attracted notice had it not been for the collision between the *Bywell Castle* and the *Princess Alice*. The result of that catastrophe was the appointment of the Thames Traffic Committee, who heard a large amount of evidence respecting the navigation of the river, and in their report made a series of elaborate suggestions for its better management. Of some of these suggestions the Conservators have now availed themselves. In October last they provisionally issued rules which were for the most part identical with the principal recommendations of the Committee. Objections to these having been heard and considered, some alterations have been made, and the regulations are now published in what is apparently their final form. It is still necessary that they should be sanctioned by an Order in Council, but probably this sanction will be given as a matter of course.

It was not a little remarkable, as indicating the carelessness with which the Conservators have throughout treated this very important matter, that, when they first gave forth their rules, they did not take the trouble to make a very simple statement in comprehensible language. They had to say that certain by-laws with sub-sections were to come into force and to take the place of others which were to be repealed; but to say this in intelligible sentences was too great an effort for them, and they contentedly published a preamble from which no man could gather which by-laws were to come into operation and which were to be done away with. Now—with the aid presumably of some law-writer or copying-clerk—they have remedied this blunder, and have contrived to express themselves clearly. For the rules themselves they are but in a small degree responsible, since they have, as has been said, accepted for the most part the suggestions of the Committee, and have made only the alterations above referred to and some others of no very great importance. Judging from the specimen of drafting with which they have favoured the world, it may certainly be held to be fortunate that they did not attempt to make large changes in the code of by-laws prepared for them; but it is much to be wished that they had been consistently true to their well-earned character for inertness, and, contenting themselves with small alterations and rearrangement, had not tried to exercise their own judgment further. Unluckily they seem to have thought it necessary to show that they were not mere registrars of the decrees of the Committee, and that they could to some extent form opinions for themselves. Accordingly they have struck out the rules which that body proposed for the navigation of dumb barges—*i.e.* barges managed by oars. Their self-assertion in this case is greatly to be regretted, inasmuch as the necessity for regulating this traffic was shown by evidence which was perhaps stronger than any other adduced before the Committee.

With this unfortunate omission, however, the responsibility of the Conservators in respect of the code which is shortly to become law virtually ends, they having merely done what they were bid. As the Committee who are really answerable for the new rules included some highly competent men, who undoubtedly took much trouble with their work and heard a great deal of evidence, it might well have been expected that the regulations which were the result of their long and careful consideration would be satisfactory ones. On a previous occasion, when commenting on their Report, we endeavoured to show that this expectation had not been fulfilled, and that there were good reasons for holding that some of the proposed rules were bad ones, and would do great harm. Now that it is officially announced that they are shortly to become law, no apology is necessary for again drawing attention to the evil which may be caused by them. The figures which we have quoted show the unparalleled magnitude which the Thames traffic has attained; and it is most urgent that some heed should be given to a series of rules which may make the conduct of that vast traffic even more dangerous than it is now, and may ultimately drive one class of vessels from the river altogether. We believe that this may not improbably be the result of the code which is now to come into force. There is good ground for believing that its authors have been guilty of grave errors both of omission and commission. They might have laid down for the government of the river a broad and simple rule which would have deprived wrongdoers of all excuse, and could be misunderstood by nobody. This, we need hardly say, is the starboard or right-hand side rule, according to which steamers going down stream keep to one side of the river, those going up to the other. It was recommended by the tribunal which reported to the Board of Trade, and was considered by the Committee. With one dissentient they decided against it on the ground of certain objections to it which were enumerated in their Report. To any general rule regulating such navigation as that of the Thames there are certain to be objections, and it would be futile to deny that those put forward by the Committee had considerable weight; but, forcibly stated as they were in the Report, it was scarcely possible to avoid the conclusion that they were more than counterbalanced by the great advantages of this rule, which, if properly enforced, could hardly fail to diminish the chance of collisions. The true cause of its rejection by the Committee was prob-

ably the inveterate dislike which Englishmen have to a uniform and comprehensive act of legislation. It is to be observed that one of the regulations suggested by the Committee, which is identical with the rule for vessels meeting at sea, will to a certain extent make it expedient for ships going down stream to keep to the right-hand side, and for those going up stream to keep to the left; but it has the advantage of not making this legally necessary, so that captains and pilots who navigate their vessels badly will find it far easier to defend their misconduct than they would if an imperative law existed which could not be misinterpreted. Perhaps, however, it was too much to hope that English legislators would recommend a broad and simple enactment; but certainly it might have been hoped that they would avoid positive error, and would not lay down rules which are likely to cause collisions. Unfortunately it seems by no means improbable that this is what the framers of the new code have done. Many of their regulations are taken from the new rules for preventing collisions at sea, and in one case certainly they do not seem to have realized what effect a rule intended to apply to the navigation of the open sea may have when it is applied to the navigation of a crowded river. By the new code steam-whistle signals are largely introduced. A captain may intimate by one short blast of the steam-whistle that he intends to direct his course to the right, or by two blasts that he intends to direct it to the left. Whether the use of these signals will tend to make accidents at sea less numerous it is not necessary now to consider. That it will do so in the Thames is, to say the least, extremely unlikely. The framers of the rules seem to have fallen into the very general error of thinking merely of the case of two vessels approaching each other, and forgetting that many other vessels may be close to them. With several steamers very near him a captain may be utterly misled by a whistle signal intended, not for him, but for another commander. In one of the Thames reaches there are sometimes a dozen steamers at once, and it would be hard to exaggerate the confusion and danger which may be caused when on a dark and hazy night bewildering whistle signals resound in all directions. This grave objection, moreover, is not the only one which can be urged against the provision authorizing the use of these signals. It will certainly serve as a safeguard for the delinquents, already sufficiently numerous, who will not obey the rule of the road; but this is not astonishing, for the new code seems in part to have been framed with the express purpose of giving scope to ingenious defences.

If, however, those who are responsible for it had merely applied the new regulations for ships at sea to the navigation of the Thames, they would undoubtedly have been sheltered by authority. Unfortunately they have not done this, but have invented a rule of their own, which is not unlikely to do great harm by driving one class of vessels from the waters of the Thames. According to the existing law, when two vessels, one of which is a steamer and the other a sailing-ship, are proceeding in such a direction as to involve risk of collision, the steamer is to keep out of the way of the sailing-ship. The obvious justice of this rule needs no exposition. The present legislators have, however, thought fit to improve on it, and have added to it a rider, which is so remarkable that we give it *verbatim*. They lay down that "If, owing to "causes beyond the control of those navigating the steam-"vessel, it is unsafe or impracticable for the steam-vessel "to keep out of the way of the sailing-vessel, she shall "signify the same to the sailing-vessel by four or more "blasts of the steam-whistle in rapid succession, as men-"tioned in Rule [18]; the sailing-vessel shall then keep out "of the way." The language of this extraordinary clause is well worth notice. The legislators, be it observed, have used the word "impracticable," one of the most vague in the English language. Strictly speaking, it means impossible; but those who chose it can hardly have intended it to bear this meaning; for, if it does, the Rule states simply that a steamer shall not get out of the way when she cannot get out of the way. As well enact that a steamer shall not be required to proceed along a high-road. But the word impracticable is not always used in this strict sense, being sometimes meant to indicate, not absolute impossibility, but very great difficulty; and probably it was intended to have some such signification as this by framers who seem intentionally to have used an uncertain word. Even when this interpretation is put on their rule, however, it still remains an absurdity. Nothing is said about the course to be followed when it is "unsafe or im-"practicable" for the sailing-vessel to get out of the way, and, therefore, in those cases where there is difficulty for both vessels, that which has the least power of locomotion is, according to this enactment, to keep clear of the other's course. So monstrous a provision will no doubt be tempered by a Court of law, which will virtually supply what the legislators have left wanting; but, even when freed from preposterous anomaly, the clause will still have a bad effect. It will operate as an encouragement to captains of steamers to do that which a great many of them are only too willing to do already—namely, to refuse to give way to sailing-ships. Although, under the present law, steamers are required to keep out of the path of the latter, they very frequently do not, the captains rightly judging that, even with the law on their side, the masters of other vessels will prefer to avoid collisions. With this clause to aid them, wrongdoers will become more reckless than ever. Men are careless enough with a strict law, and what are they likely to be when the law has deliberately been made vague and uncertain. It will be hard indeed if after a collision the captain of a steamer cannot produce some evidence that it was "unsafe or impracticable" to get out of the way; and though the Courts will of course endeavour to do justice, the proverbial difficulty of collision cases will be increased, and too often it will be impossible to punish the true offender. The probable result, then, of the new rule will be to make the Thames dangerous for sailing-ships, and possibly in time to banish them from the river altogether. This result we believe to be most undesirable. Cargoes to a huge amount are still carried by sailing-ships, and probably will be carried by them for some time. If, however, it was thought desirable to exclude these vessels from the Thames, the project should have been openly stated and fully discussed. As it is, a sluggish and feeble official body has given its facile assent to a grave innovation the full bearing of which its members probably did not in the least understand.

THE DECLINE OF LITERATURE.

"THE stage is fashionable, science is fashionable, art is fashionable, but literature is not fashionable," an acute American critic of English society wrote last year. Is it not true, and, what is more, does not literature deserve that it should be true? Who are the lions of Mrs. Ponsonby de Tomphins? Are they essayists, novelists, poets? or are they not rather the professor who has just demonstrated something about Bathybius, the actor who makes people laugh or cry, or the painter whom half the world blesses, while the other half says that he and his works should be burned? When Colonel Newcome came to town he sought for "the wits" in the Cave of Harmony. He sought for the wits, and he found Captain Costigan. These things are an allegory. The wits of to-day are no more literary men than they are to be found in the Cave of Harmony. The people who "please the town," as the old writers say, are not, in the old sense, men of letters. These used to be the wits; now the wits are painters, actors, newspaper reporters carried to a higher journalistic power, or popular preachers. Literature has ceased to be witty, and therefore, and naturally, it has ceased to be fashionable.

Let us look at any of the ages when literature was fashionable, and when men of letters were courted, caressed by the great, and no less generally known and stared at than if they had been professional beauties. The characteristic of all such periods—that of Anne, of Louis XIV., of the earlier Georges—was the familiarity, the geniality, the accessibility of literature. The greatest men of genius played with their immense powers, and set them to sportive tasks. They came down into the market-place or the coffee-house; they met all comers, refused no challenge, and quitted them like men. The light literary work of those old times was done to perfection by the most distinguished men. Swift, Addison, Steele, Pope, Congreve, and the rest, did not think it beneath them to be playful. They toyed with Saccharissa's snuff-box, and with the curls of Neæra's poodle. They fought honest battles with Grub Street in the open air of literature. They poured out light verse that ladies liked, and that even fops admired and could try to imitate. Every gentleman of spirit was somewhat of a man of letters then, and could turn an epigram or a compliment in verse. Even the fribbles of Molière's plays are more interested in poetry than in scandal or lace. The very best literary genius was always at the service of the stage, and the stage was glad to win its assistance. In short, the men of letters did not cease to be men of the world; while men of the world were tempted to try to become men of letters. It was not odd, then, that literature should be fashionable. Civilized people must have some intellectual interest, and literature supplied all they wanted. Its wit, its courtliness, its readiness and flexible force met them everywhere. In controversy Pascal defeated the

Jesuits with a laugh. In church the preacher was a great writer of permanent excellence, like Bossuet; or, if he was not that, he could preach a gay little essay or sketch a character almost to be mistaken for the real La Bruyère. In the shops the very tradesmen were *connoisseurs*, and could and did discuss Etherege or Boursault with their customers. In the boudoir or the *ruelle* verses were handed round as bright as Pope's or as smart as Voiture's. In the coffee-houses the great men could be seen and heard. Literature, in fact, had taken all human interests for its province, was adorning them all, and making them all imperishable in immortal essays, satires, poems, sermons. Our modern literature is comparatively a dowdy drudge. Satire is beyond her powers; she is ousted by specialists from most of the field of human life; she mopes at home in slippers; she does not go out into the world in the peach-bloom coat of Goldsmith or the ruinous Venice lace of La Fontaine. Literature, in short, is not only out of fashion, she is in a decline.

It may seem paradoxical to talk of the decline of literature at a time when "of making many books there is no end." But that sentence of the Wise Man's contains the very gist of the charge against modern English literature. Authors are, indeed, busy with "making books," rather than with literary composition in the true and old sense of the words. A glance at the most popular books of each season will prove the truth of this pessimistic assertion. The books that succeed best, apart of course from sermons, are of four or five classes, and are chiefly forms of journalism. There are pamphlets or tracts, big or little, on "questions of the day." Such works, for example, as the Duke of Argyll's *Reign of Jaw* (as it has been unkindly styled) about the Afghan question are on the same footing as the newest and most advanced or most reactionary theological speculation. These things are really pamphlets; they are written for the minute, rather than for the hour or the day, or we may say that they are monumental leading articles, and they live but for the life of a leading article. The fact that they are bound up between cloth covers, and that each of them numbers its four or five hundred pages, makes no essential difference. Thus we may set about a fourth of the new books aside as pamphlets which are "without form," and to-morrow will be "void" of interest.

The second of the great classes of modern books which are not literature consists of "picturesque reporting"—or *reportage*, as the French contemptuously call it—in disguise. The picturesque reporter has plenty of fields in which he can do business that is profitable, and produce matter full of contemporary interest, but still matter that lacks the form and stamp of literature. The picturesque reporter may write in big, bloated volumes the life of a contemporary statesman. He may hurry after the Special Correspondents, and compile in seven weeks the history of a great war. He may travel and bring back brilliant reports of the countries he has visited on a bicycle, and the manners he has viewed from the streets, and in this case his work comes more near to permanence than in the others we have mentioned. Instead of travelling, he may make his home in a foreign capital, and write about it in a very full and instructive way, so that his book is more valuable than a series of letters from a Berlin or St. Petersburg Correspondent. It is possible, by the aid of sagacity, or style, or humour, to make a work of this sort as permanently readable as Arthur Young's account of France, or Mme. d'Aulnoy's *Voyage en Espagne*. Humorous travels, like Dumas's, Chapelle and Bachaumont's, or Sterne's *Sentimental Journey*, really belong to literature; but we have probably not more than one traveller whose voyages are really humorous. Most of the rest produce lumps of journalism, on a level (as far as literary merit goes) with Mr. Stanley's writings on Central Africa.

There remain three other sort of books which do not properly belong to literature. There is the mass of works of fiction which are in no sense works of art. There are novels, of course, which belong to literature as much as do those of Le Sage or Fielding, but their authors may easily be counted. When novel-writing became a profession, it began to sink from the level of an art to that of a manufacture. Again, there are the countless manuals and handbooks which are published in "series." Mr. Tozer, the dissenting butterman in *Salem Chapel*, said that the congregation liked "a course" of sermons. Apparently the public also likes a "series," and there are few historical, scientific, literary, or even philosophical fields on which many flocks of "series" are not browsing. Occasionally two editorial shepherds discover the same pastures new at the same moment, and then they quarrel as to right of occupation. Who is to drive his flock first among "Foreign Women of Letters," or "Lives and Labours of Great Inventors"? Is Bacon's editor or Bungay's to enter the field? The flock of writers, too, *servum pecus*, have their jealousies, and fight and butt among themselves. Who is to "do" Louise Labé, for example, among the "Literary Women"? While the rival editors of Bacon's and Bungay's "series" fight for the whole field, the learned Tomkins, the discursive Smith, the ponderous sagacity of Brown, and the rapid Jones are all squabbling, all eager to write about Louise Labé. The question has to be settled by the editor, who happens not to know French, but readily undertakes to criticize the life and writings of the passionate poetess of Lyons. Such are the ways of the modern "series," which surely no one will call (with some honourable exceptions) permanent additions to literature. It may even be said that the scores of short popular paths to literary, or philosophical, or scientific knowledge are themselves a proof that literature is declining. Both the production and the enjoyment of literature demand leisure. Now writers hurry through old books with note-book in hand, and readers bustle rapidly through the pages of primers. Books are written for him that runs, and he that runs has seldom time or eyesight for more than a glance at an advertisement by the wayside. The very tattle of the hour is written by persons so grossly ignorant of the language that a gossiping report of a marriage printed this week contains a monstrous and absurd indecency.

Setting apart the journalistic work of big pamphlets, of long "specials," of novels which are pot-boilers, and of manuals and primers, how much literature is left among the books of a year? Alas, it would be a short and invidious calculation that settled this question. Out of about two hundred volumes of poetry (the topic of poetry is too painful to be fully discussed), out of some nine hundred novels, and a few collections of essays, to which 1879 gave birth, how many will be remembered in 1889? Every one may make the reckoning for himself. Every one knows whether modern life is made more brilliant, and whether it is likely to be made more permanent, by modern literature. Perhaps not more than two or three men with the true literary gift have in late years gone down into the market-place, and lighted up with their wit the business and the questions of the day. In science some have distinguished themselves thus; in politics and social discussion we can only think of the name of the author of *Friendship's Garland*.

The causes of the decline of literature are not far to seek. Hurry and impatience, and the crowd of commercial and scientific interests, leave no time for the delicate sense of pleasure in exquisite workmanship, in language truly just and appropriate, in polish of style, in vivacity of wit, in the humour which should never be absent from discussion. Literature can only recover its place when the world regains its leisure.

THE JEWS IN GERMANY.

PROFESSOR HEINRICH VON TREITSCHKE, the eminent German historian, politician, and publicist, declares that there exists in his country a "Jewish question." In the last number but one of the *Preussische Jahrbücher*, of which he is the editor, he concludes a most interesting paper on the prospects of Germany with a trenchant attack on the German Jews; and this attack he justifies and develops in the current number of the same periodical. The position which he takes up is as follows. Germany is a newly-formed country; and though in Prussia it has found a strong and comparatively old State to serve as nucleus or leaven to the whole, the moral unification of the people cannot be said to be yet completed. Both the internal state of the country, in face of the Socialism of the artisan class, and its external policy, in view of the two dangers which menace it from the East and the West, make the firmest moral union at home indispensable. Now there are several reasons, he argues, why the Jew—harmless, and even useful, in some countries—is a source of danger to Germany. The first is that the Jews are much more numerous there than in the other countries of the West. In 1871 there were in Spain 6,000 Jews; in Italy, 40,000; in France, 45,000; in Great Britain, 45,000; in Germany, 512,000. The rate at which they have increased during the present century is very striking. In 1816 there were in Prussia 124,000 Jews; in 1846 there were 215,000; in 1875 there were nearly 340,000. Nothwithstanding 3,000 conversions to Christianity, the proportion of Jews to the whole body of inhabitants in Prussia rose between 1816 and 1846 from 1 in 83 to 1 in 75. At Berlin there was in 1816 1 Jew to every 59 inhabitants; in 1846 1 in every 49; in 1871 1 in every 23; and now there is, probably, 1 in every 20. Nor do these figures give any adequate notion of their influence. The average of wealth among them is very high, and the average of education still more remarkable. In 1875 the proportion of Jews in the Prussian Gymnasien was 1 in 9·5, and in the Realschulen of the first class 1 in 10·26. It is notorious that a quite disproportionate number of Jews are members of the learned professions, and that the press in Germany is almost wholly in their hands, with the result, as Herr von Treitschke says with scanty politeness, that nobody now believes what he reads in the papers. There is further, it is alleged, an important difference between the quality of the Jew in Germany and in France, Italy, or England. The German Jews are very largely immigrants from the Slavonic East, while the Jews in other Western countries are in great part descendants of the Spanish and Portuguese Israelites—in other words, of the aristocracy of the race. The fact of this superior quality causes them to be treated with more respect, and this respectful treatment reacts on their own feeling towards the countries they live in. A Jew in England, France, or Italy feels himself an Englishman, Frenchman, or Italian, while a German Jew, Herr von Treitschke declares, feels himself simply a Jew, not a German at all, and looks on his Teutonic and Christian fellow-citizen with aversion and contempt.

It is easy at all times, and especially pleasant in polemical writing, to deal in generalities. It would require a very intimate knowledge of German society and periodical literature to measure, with any approach to accuracy, the amount of truth which such a charge contains. It is only fair, however, to the accused party to say that the writer who brings it is a notorious partisan. He is a man of learning, and, what is rarer, a man of genius; but neither his learning nor his genius saves him from puerile and, where his Germanism is in question, from almost savage prejudices. When one considers the tone in which he habitually writes of

ourselves, and how he has for years been declaiming against perfidious Albion in the style of a French schoolboy after the Battle of Waterloo, one gets the measure of his judicial power. But as an advocate he is too important a man to be denied a hearing. He is at present engaged in an active controversy on the subject with Herr Graetz, the historian of Judaism, from whom it does not appear likely that he will learn any valuable lesson in courtesy and moderation. The two disputants may be left to a fight which they evidently both enjoy. But the subject has an interest for impartial bystanders, and for the sake of fair play it is worth while to state the case on the other side as it might be put by any moderate and sensible Jew.

"It is not our fault," he might answer, "that we are cleverer than some other races. If we obtain so large a share of good things in Germany, the fact is due simply to our own wits and to free competition. You admit that a return to the old days of persecution is no longer possible; why do you grumble that we make use of the liberty and equality which has been at length granted to us? It is bad enough to taunt us with the faults bred in us by long enslavement and persecution; but it passes the bounds of all reason and fairness to attack us because, starting as we have done heavily weighted in the race, we prove able to beat you on your own ground. We play a great figure on 'Change; well, we have a turn for finance. We have got the control of your press; we should not have done so if we had not readier pens than you. We give our children a good education; nothing more praiseworthy. We only, like other sensible people, do the best we can for ourselves. The German professor lectures at St. Petersburg, the German artist paints at Rome, the German clerk competes successfully with his English rival at Manchester. The Russians are jealous; the Italians would sell more pictures if you did not help to glut their market; the English would rather you went to New York. You are quarrelling not with us, but with the inevitable condition of life, according to which the fittest must win, and according to which you win when you are the fittest. Special reasons there are why we don't get along with you Germans as we do with some other races; but they are not quite those that you say. In the first place, being so many, we naturally form more of a party, and are better able to find all that we need among ourselves than we do elsewhere. Secondly, we are successful, and that makes you dislike us. In Scotland, having to do with people of a different make, we find we can't get on. The Italians say that a Genoese is a match for seven Jews, and there are almost no Jews in Genoa. We don't make a fuss because the Scotch and the Genoese are more than able to hold their own against us. Why should not you be equally charitable? Finally, as regards our alleged want of patriotism, it is unreasonable to expect that old wounds can be cured in a day, especially as you still do your share in keeping them open; and it is unfair to ask that a race which, even in the days of the old prophet, was described as a people that 'shall dwell alone,' and which your age-long persecution has driven into closer union with itself and wider separation from the rest of mankind, shall lose in a day instincts and habits which have worked themselves into the very structure of its character."

Nevertheless, up to a certain point, Herr von Treitschke has reason on his side. The present position of the Jewish race is altogether anomalous. The Jews are at once the most national and the most cosmopolitan race on the earth; but they neither found a State of their own, nor do they become absorbed in the population of the countries they live in. It seems difficult to believe that this contradiction can be a permanent one. The scandalous oppression under which they long suffered forced them to be a caste apart. It was as futile for them to hope for a genuine national life of their own as it was to hope to share the national life of others. Their enfranchisement puts the alternative before them to do either the one or the other; and the one or the other they will in the natural course of things do. It is obvious that the race is in a state of transition; and all final or dogmatic judgments about it are as unreasonable as they are impertinent. But it needs no prophet to see that the sentiment of nationality which has attained in our days a force hitherto unknown in the world must inevitably turn the scale one way or the other. Either some sudden impulse, of which at present there are few signs, will lead the race to attempt the task, whether possible or impossible, of founding a Jewish State in the East, or else continued intercourse with the Christian world, the continued sharing of its public life and continued intermarriages between Jews and Christians, will gradually lead to the absorption of the people by the other nations of the earth. No one but themselves will venture to say which would be the better alternative; but the latter certainly appears the more likely. But it is probable that they will long hover between the two paths, too full of individuality to be easily absorbed, and with too little political cohesion for any great national enterprise to be feasible. And for countries like Germany, where they are very numerous, or like Roumania, where they live among a much less energetic people, the results of this dubious position will not be without inconvenience either to themselves or to those among whom they live. It is idle to complain of what is inevitable, and of what is very largely the result of Christian misdeeds in the past. There is one obvious method by which the preponderance of the Jews may be checked, whether in Germany or elsewhere, which is for the Christians to have their wits about them a little more. Herr von Treitschke looks on his own country as a kind of Promised Land in modern civilization. We do not quarrel with this sentiment, and only wish that the same sort of national faith and pride were commoner than it is among some of our own politicians. If a country does not believe in itself, it is not likely to get others to believe in it. But his inconsistency lies in depreciating and decrying the Jewish population of Germany, and at the same time declaring that they constitute a serious danger to the old and vigorous and, in his eyes, unique German civilization. He must make his choice. Either the Jews are not what he makes them out to be, or else the vitality of his own people is much lower than he pretends. Fuller information on these points can be sought from Herr von Treitschke himself; but for fuller information as to the future of the Hebrew race we may have to wait until Daniel Deronda comes back from the East.

THE PENALTIES OF SCRIBBLING.

WE should hail with satisfaction the appearance of a patent medicine (even if it contained an opiate) which should prove a sure remedy for the fever for scribbling. Failing the discovery of any such specific, perhaps the best way of treating the disease is to "get it over" as quickly as possible. The first symptom is an inclination to write, which is speedily followed by an unnatural craving to see the writing reproduced in print. When the symptoms are so far developed, the patient is undoubtedly in for the fever, and there is nothing to be done but to wish him well through it. In the early stages of the complaint the victim suffers from strange hallucinations. He has an inordinate longing to write for his favourite journal, and his mind pictures to itself the pleasures and glories of being one of its contributors. He dreams of the ecstasies of seeing his own effusions in print, and of reading what he himself has written in pages which he reverences almost more than the Scriptures. He imagines his sage remarks being read in all parts of the world, "from Greenland's icy mountains to India's coral strand," and he feels, with the journalist in *Pickwick*, that the press is indeed a mighty organ, of which he himself would fain turn the handle. He contemplates the raptures of lying upon the tables of the *literati*, of being read by royalty, and of being filed and bound by librarians. In church during the sermon he reflects with satisfaction that, if the parson slays his thousands, he will slay his tens of thousands; for what is the congregation of St. Tabitha's to the vast number of the readers of the "Literary Critic"? He will amuse more people than the most famous comic actor; he will teach and preach in more corners of the globe than the most ubiquitous of itinerant missionaries; and he will speak with the voice to which all men bow and submit—the voice of the "Literary Critic." He will be a lion at once. All authors will tremble in the presence of a live reviewer. In society he will observe men in little groups looking at him, and whispering to each other the momentous words—"He writes for the 'Literary.'" His articles will form the usual topic of conversation, and they will constitute a regular succession of seven days' wonders. He will make for himself an immortal name in his family; just as in noble families there is "the wicked earl," or "the earl that won the Derby," so in his family there will be everlasting traditions of "the Smith that wrote for the 'Literary.'" He closes his meditations with anticipations of the golden rain of guineas which will reward his efforts, and forthwith takes up his pen to write.

Having described the dreams of the scribbler, we proceed to consider the reality. We may as well dismiss at once all idea of the writer who fails to obtain insertion for his articles in the august columns of his favourite journal. He is, in a literary sense, defunct; or, if he is to continue to exist at all, it must be in lower spheres. We will rather contemplate the fortunes of the man who has succeeded in getting an article "taken," and has the proud satisfaction, on cutting a certain number of the "Literary," of seeing the title of his own contribution in the list of contents. Despite his annoyance at finding that what he considers the most telling passages in his production have been excised, he no doubt derives very great gratification in reading his own words in the journal for which he has such a profound respect, and he feels that he has awakened to find himself famous. When he goes out and meets friends who salute him as if nothing had happened, he says to himself, with a smile, "If they only knew——!" He cannot long keep the great news a secret; and, having found a faithful friend, he confides to him the all-important fact that he sees before him a Literary Critic. "I am glad to hear it," replies the friend; "writing will be a nice amusement for you." To the mind of the newly-started journalist it would be as congruous to call the hurling of Jupiter's thunderbolts pretty child's play as to speak of the wieldings of the pen of a contributor to the "Literary" as "a nice amusement." He seeks another friend, who observes, on hearing the news, that the "Literary" has gone downhill very much lately. Another friend congratulates him warmly, adding, "You are the very last man in the world whom I should have expected to write for the newspapers." An old schoolfellow simply asks him why he does it—a question to which he is not able to find an instantaneous answer. As a rule, he only confides the news to his intimate friends; but he cannot resist the temptation of letting a rival of whom he is jealous pick up the astounding information, as if by accident. This is an opportunity of dealing a deathblow, which he could scarcely resist if mortal. Mark how his enemy reels under the blow. "Indeed!" says he, "*I* used to write for the 'Literary' in my scribbling days." Altogether the all-important fact does not

become universally known as soon as might be expected. The journalist cannot tell everybody himself, and hints are not always taken, nor does the information, when delivered directly, create so much astonishment as might be anticipated. The "Literary Critic" is left about the house in conspicuous places; but now that the owner is a contributor, people scarcely ever seem to read it. Occasionally some one says, "I have been reading a capital article in the 'Literary'"; but it never chances to be the article written by our hero. When he has no contribution in the current number, all his friends who are aware that he is in the habit of writing seem to have conspired together to ask him whether he has "anything in the 'Literary' this week"; but when he has a good article in it, no one asks him any question of the kind. When he gives an acquaintance to read what he considers the most amusing article he has ever seen anywhere, he watches its effect from behind the advertisement sheet of the *Times*. Without moving a muscle of his countenance, his acquaintance peruses the article gravely from beginning to end, and lays down the paper with a yawn. A friend asks him whether he has "been writing any letters to the 'Literary Critic' lately?" Now he can stand a good deal, but to hear his articles spoken of as "letters" is simply unbearable; nor is he soothed by the inquiry from a bystander, "Why, if he writes for the newspapers, he never writes for the 'Sloppington Advertizer'?" If he earns a few guineas, at the cost of much time and labour, he seems to earn very little glorification; he cannot discover that he is more respected than formerly, nor is he stared at by open-mouthed admirers.

We have dwelt upon the scribbler's disappointments. But still worse things are in store for him. There is a class of lion-hunter which creates a lion if it cannot catch one. The slightest pretext is sufficient material for it to work upon. Heedlessly wandering away from his own country and his father's house, the Literary Critic is seized upon by one of these sportsmen, who summons the world to prey upon the victim which he or she has netted. The journalist soon feels that even what one of Thackeray's heroes termed "hobloquy" was better than this. He is invited to literary parties where the introductions are conducted in the following manner:—"Mr. Brown, the author of 'A Year's Travel in the Mozambique'; Herr Bleichröder, the inventor of the Baby's Reading Lamp—Mr. Smith, a famous English journalist; Mr. Smith, of the 'Literary Critic'—Mr. Jones, of the 'Unbelievers' Review.'" His few articles have been on light social subjects, and his reviews have been of trashy novels, but he is asked to meet Professor Putkammer because that gentleman has been much interested by an article in the "Literary Critic" upon "Deductions from the Heliometer upon the Value of the Solar Parallax." The Professor naturally expects him, as one of the contributors, to be well versed in the subject. A celebrated divine attacks him from the opposite side of the table on the tone of the theological articles in the "Literary Critic," and an author whose book has been severely treated in the pages of that journal revenges himself by making an evening as disagreeable as possible for the unoffending contributor. Questions as to whether he has written, what he has written, and when he has written for the "Literary Critic" become as familiar to his ears as the conventional inquiries as to health or remarks upon the weather. He almost begins to hate the name of his favourite journal. Instead of being sent down to dinner with charming and beautiful women, he is allotted to bluestockings and champions of women's rights. Before he has half finished a sentence people begin to laugh, and when he observes that a certain song is pretty, he overhears one person saying to another "What dry remarks he makes!" He is set upon by numbers of would-be authors, who come armed with novels and travels in MS. which they request him to read and criticize. He is to decide whether they are worth publishing, what they would cost to publish, or what publisher would accept them. The amateur editor of a local archæological paper begs him to write an article for him, and a clergyman presses him to contribute to the "Parish Magazine." It is useless for him to urge that such things are not in his style. Is not a writer a writer all the world over? A friend whom he can scarcely afford to offend asks him to persuade the editor of the "Literary Critic" to insert one of his articles in that journal. Other friends pester him to write articles upon this subject and upon that, from the theological aspects of the nineteenth century to the breeding of shorthorn cattle. Nor are these uninvited volunteers easily put off; they buttonhold him in the Park or in society, and they coach him in a desultory sort of way on the subjects that they want him to treat; they contrast their own orthodox views with the heterodox opinions of others, and request him particularly to dwell upon certain points. After confusing, without enlightening, him for half an hour, they conclude by saying, "And then I want you to work it all up, you know, into a satirical article." Instead of being invited to country houses for shooting or ball parties, he is asked to meet the bishop and the author of a history in twelve volumes. Young ladies fly from him in terror, and children look upon him as a kind of tutor. Collectors for charities suggest that the objects for which they are working would form suitable channels for the proceeds of his literary labours, and fabulous reports are spread as to the sums which he realizes by his pen.

At the request of some of his acquaintances he reprints his best articles in the form of a book. It is beautifully got up, on toned paper, and the cover is a masterpiece of the binder's art. The only people who read the book are apparently the critics, who dissect his work with the very refinement of cruelty. He had tried his own hand several times at reviewing, and now, to use a phrase to which he was much addicted in his articles, he is "hoist with his own petard." The expense of publishing his book more than absorbs all the loose cash which he had received from his editor, and, disgusted and disappointed, he forswears for the future, books, publishers, authors, and even the "Literary Critic" itself.

ST. BENEDICT AND THE BENEDICTINES.

It has been announced that a solemn centenary is to be observed this year throughout the whole Benedictine Order, and especially at the famous Abbey of Monte Cassino, which was the cradle and is still the centre of its organic life, in honour of the fourteen-hundredth anniversary of the birth of its illustrious founder St. Benedict, in 480. The celebration is a natural one, Benedict may justly be styled the father of Western monasticism, which received its first impetus and its mould from his informing hand, since all later religious orders, or at least all established before the Reformation, are directly or indirectly modifications of his rule. To celebrate his centenary is in fact to keep the birthday of monachism in the Latin Church. And the institution is one to which, apart from all theological or ethical differences of view, Protestants need not be, and of late years have not been, slow to acknowledge their indebtedness. It is not only, as Mr. Lecky has rightly pointed out, that to the monks and especially to the Benedictines we owe it that the dignity of labour came to be appreciated, as under Pagan forms of civilization it never had been appreciated, in modern Europe. Nor was the rapid spread of monasticism due simply to the popular belief—a belief not difficult to account for in a rude and barbarous age, when "conversion" seemed almost to imply seclusion from the world—that the cloister was the sole or the shortest road to heaven. It had other and more sublunary attractions for many classes of minds. It combined the elements of aristocratic and democratic power in the princely position and prestige of the abbot, who ranked with the highest of the land, from whom indeed he was often sprung, and the vast commonwealth of monks where peasants and emancipated serfs found a secure refuge and took their place side by side with the tonsured knight or noble, in the choir and chapter house or at the plough. There too was seen the corporate influence of vast wealth · generally, it is fair to add, expended with great benevolence—combined with the merit of individual poverty. And thus to the ambitious, the philanthropic, and—in Benedictine houses especially—to the studious, the cloister offered attractions hardly less inviting than to the devout. Monasteries were the nurseries not only of labour but of learning; they were the great eleemosynary institutions of the age; and mitred abbots made their voices heard in courts and parliaments. Of this vast and comprehensive system St. Benedict of Nursia was the founder, and from him it derived, as has been intimated already, not merely its origin, but the shape and form which, throughout all variations of detail, it has substantially preserved from his day to our own. If it be true that "the Benedictine statutes still remain a living code, written in the heart of multitudes in every province of the Christian world," that is partly due to the remarkable union in the person of their author of those opposite characteristics, active and passive, which usually divide mankind; he had the instincts at once of a worker and a thinker, a ruler and a recluse. And his whole nature was dominated by that fervent yet profound enthusiasm without which no man in any age—least of all in such an age as his—can hope to exert a lasting influence over his fellows.

Benedict was born at Nursia, in the duchy of Spoleto, in 480 of respectable parents, and, if we may credit Mabillon, gave early presage of his future sanctity by singing eucharistic hymns in his mother's womb. He was sent to Rome for his education, but the sensitive boy fled from the vices of the capital and took refuge in a cave near Subiaco, which is still pointed out to travellers, not far from the site of Nero's villa of *Sublaqueum*, and here he was wont, like St. Jerome, to subdue his animal passions by rolling his naked body among the thorns and sharp points of the rocks. At length his hiding-place was discovered and the fame of his sanctity led a neighbouring convent of monks to choose him for their head, in spite of his earnest remonstrances. They soon tired however of the severity of his rule and attempted to poison him, but the cup miraculously broke in his hands, as the Breviary assures us, and after calmly reproving their wickedness the youthful abbot returned to his old solitude. But solitude was no longer possible for him. Little communities of monks or hermits grew up around his retreat and under his government, including some noble youths from Rome who were drawn thither by his growing reputation, one of whom, Maurus—afterwards known as St. Maur, founder of the Order in France—began, it is said, very soon to share his gift of miracles. There was another attempt to poison him, the culprit this time being a priest named Florentinus, who was envious of his fame, and then at last, about his fiftieth year, Benedict left Subiaco, never to return. He travelled to a hill overlooking the fountain head of the Liris, Monte Cassino, where an ancient temple of Apollo is said to have been still standing, to which the ignorant peasants brought their offerings. Benedict converted them, destroyed the idolatrous temple, cut down the grove, and raised a monastery on its site; and here, to use Milman's words, "arose that great model Republic, which gave its laws to almost the whole of Western Monasticism." But even in this final retreat he was

not left undisturbed. The storm of war swept over Italy, and Totila, the Gothic monarch, came to visit him, when the saint rebuked him for his cruelties, and predicted his conquest of Rome and his death after ten years. His last days are said to have been darkened by a vision of the destruction of his abbey by the Lombards, which happened forty years afterwards, but consoled by another vision, which also came true, of the extension of his rule throughout every part of Europe. He died March 21, 543, and was buried in the oratory of St. John the Baptist which stood on the site of the demolished sanctuary of Apollo.

The Benedictine Rule is of course bound together, as its animating principle, by the threefold cord of monastic perfection—poverty, chastity, and obedience; and the three occupations into which the Benedictine day is apportioned are divine worship, study, and manual labour, the last two of which found no counterpart among the cœnobites of the East. But the comprehensive vigour and wisdom of his polity, which has made it the model for all subsequent institutions of the kind; the skilful adjustment of abbatial dominion with universal suffrage of the monks, at once concentrating power and diffusing it; and that prescient insight into the human heart which has moulded some forty generations of men and women (for there are Benedictine nuns also) into voluntary and submissive instruments of his will—all this does certainly show a legislative capacity which, as Sir James Stephen observes, may well appear to those who reject the theory of supernatural guidance "a phenomenon affording ample exercise for a liberal curiosity." And we may further agree with him that, great as are the services rendered by the Benedictine Order for many centuries, by their agricultural labours, their marvellous architectural achievements, and their priceless libraries, their greatness is most signally attested by the names of so many worthies illustrious alike for active piety, for administrative wisdom, for profound learning, for devout contemplation, and, we may add, for missionary enterprise. The names of Lanfranc and Anselm would alone suffice to show the influence produced by mediæval Benedictines on English history and theological thought. The dying vision of St. Benedict was indeed fulfilled with a rapidity which he could scarcely have foreseen. In Italy houses of his Order began at once to rise, increasing as time went on in spaciousness and splendour, from Calabria to the Alps, and to this day, or at least till the recent changes, scarcely a town of any size was without its Benedictine convent. His monks, as an abbot of Monte Cassino expressed it, "swarmed like bees," and began everywhere to plant new monasteries. Yet it is hardly in Italy that they have won their highest reputation. Before the death of Benedict, his faithful disciple Maurus had crossed the Alps, and the first French Benedictine abbey rose at Glanfeuille on the Loire near Angers. It was the first of many rich and noble foundations, famous for their learning, and still "the name of St. Maur is dear to letters." During the seventeenth century no fewer than a hundred and five writers of that Congregation shared their literary renown, and to them we owe the best editions known of the works of many of the Fathers, both Latin and Greek, as well as of some later celebrities, not to speak here of the gigantic task accomplished by Mabillon alone in his *Spicilegium*, his *Acta Sanctorum*, his Annals of the Benedictine Order and other works.

To English readers it may be more directly interesting to remember that with St. Augustine the rule of St. Benedict passed into this country, and, we might almost say, took possession of it. To quote Milman once more, "In every rich valley, by the side of every clear and deep stream, rose a Benedictine abbey,' and usually the most convenient, fertile, and peaceful spot in any part of England will be found to have been the site of one of these. It may be generally assumed, till evidence appears to the contrary, that an English monastery belonged to this Order, for the Cistercian was only a stricter reform of the Benedictine rule. Far the greater number of our old abbeys, several of our cathedrals, and many parish churches were in Benedictine hands. The names of Canterbury, St. Albans, Westminster, Glastonbury, and Tewkesbury in the south, of Wearmouth, Yarrow, and Lindisfarne in the north, will recall many others to those familiar with our ecclesiastical history or our ruined shrines. So strongly indeed were the English Benedictines rooted in the soil that after the suppression of their houses at the Reformation they resolved at least to retain in the Order all their old titular dignities, in the hope of better days. And we believe that at this moment Dean Stanley has a rival in existence somewhere—though it is not on record that he has ever claimed his seat in the Upper House—in the shape of a mitred Abbot of Westminster. In mediæval England, as on the Continent before the rise of the Jesuits, the education of youth was conducted chiefly in the schools attached to Benedictine monasteries. To this day indeed those schools are frequented by Roman Catholics of the upper classes, many of whom prefer their milder and more liberal discipline to that of the Jesuit teachers. But in the present stage of civilization religious orders, whatever may be thought of them from an ascetic or theological point of view, are not likely again to acquire the wider influence or reputation that once belonged to them. They may still have their uses, but their glories must be sought rather in the past than the present. And a community which has flourished already for nearly fourteen centuries, and shows no signs of decay, may afford to repose on its laurels and dwell with a pardonable pride on the memory of a founder whose name is honoured and his will obeyed, amid all the social and moral revolutions of later ages, by a multitude of men and women throughout modern Europe and beyond it. To a thoughtful observer this abiding influence in a world so full of change will perhaps appear a greater miracle than any of those with which it has pleased his biographers to adorn their record. It would have amazed John Knox and his associates to know that, three centuries after "the rookeries had been pulled down, and the rooks had fled," a large Benedictine monastery and school would be erected in the heart of Presbyterian Scotland, on the banks of the Caledonian Canal; while another, not without architectural pretensions, has arisen almost under the shadow of Hereford Cathedral, to say nothing of the more ambiguous establishment set up by "Father Ignatius" at Llanthony. It may at least be granted, by friends and foes alike, that St. Benedict has fairly earned the honours of his fourteenth centenary.

RECREATIONS OF A GOVERNOR-GENERAL.

MR. GRANT DUFF and other persons who are good enough to concern themselves with high matters have expressed a fear that sufficient attention is not now directed to the breeding up of statesmen. In these days demand generally creates supply, and it is almost surprising that this particular demand should hitherto have been an exception to the rule. Only a few weeks ago an ingenious writer proposed the adoption of literature as a profession, and already diligent observers may see advertisements offering to train up literary aspirants in the way they should go. If, therefore, nobody has yet projected a finishing school for Cabinet Ministers and Governors of colonies, there must be some special obstacle in the way. Possibly that obstacle is to be found in a certain ignorance as to the exact functions of these functionaries; and if this be so, it is satisfactory to know that the Marquess of Lorne has come to the rescue as concerns his own class. We have received a considerable bundle of extracts and newspaper cuttings representing his Excellency's performances in the matter of miscellaneous oratory during some months of the past year. Lord Lorne thinks that "it may be of interest to see to what subjects the attention of a new Governor-General is directed by the people of Canada." We shall not quarrel with the phrase, though perhaps a carper might suggest that these addresses ought rather to be described as exhibiting the subjects to which the attention of the people of Canada has been directed by a new Governor-General. This, however, may be set aside as a subtlety of an unworthily scholastic character. But the bundle certainly supplies valuable material for ascertaining the character of a good proconsul, as some writers love to call officials of the class of the Marquess of Lorne. In default of a Dryden or a Lamb ready to work up this character duly in prose or verse, we may at any rate provisionally attempt the task.

The specimens of Lord Lorne's eloquence with which we have been favoured extend in point of date from the month of May to the month of November, May and September being apparently his most voiceful times. In subject, as might be expected, the speeches are as miscellaneous as the sausage-seller's prophecies in the *Knights*. Lord Lorne speaks concerning Canada, concerning furry hats, concerning art in the colonies, concerning Universities, concerning the late Dr. Whewell, concerning himself, concerning things in general. Coming after Lord Dufferin, it is natural that the speeches should aim at two things first of all—the first being flattery, and the second jokes. The sun which shines upon the Castle of Blarney yokes his horses at a considerable distance from Argyllshire, nor has the latter country, though it may have been the nurse of heroes, hitherto been considered prolific in jokers. Lord Lorne deserves all the more credit for having sturdily aimed at the two chief graces of proconsular oratory. He seems to have had a favourable occasion on some unspecified day in May last when he opened an art gallery at Montreal. We gather from his speech that Canadian art has been sometimes disrespectfully spoken of. "But," says the Marquess, "the meeting to-day enables me to disprove such an assertion, and to gild over with a golden hue more true than that of many of Turner's pictures the supposed spot upon the beauty of our Canadian atmosphere." It would not be kind to inquire too closely into the correctness of this highly metaphorical expression. It savours a little of the early florid manner of some other public orators. It was, however, followed by a remark which we cannot but think unfortunate. Referring to a story told of Correggio (and of that other distinguished brother of the brush, Dick Tinto), Lord Lorne expressed a hope that he might "look forward to the time when Canadian artists would be allowed to wander over the land free of expense, the hotel-keepers being happy to let them pay their bills by the painting of a sign for mine host." To hope that at some future period Canadian artists may attain to the repute of tolerable sign painters is modest enough certainly; but if the Canadian Tintos thought it complimentary, they must be a most unassuming fraternity. On the 24th of the same month the Governor-General found himself in a position which might have tried a more experienced orator. He had to speak at a military banquet where, as guests of the Canadian warriors, not a few Americans were present. On this occasion Lord Lorne showed that he possessed at least the Dantonic quality of audacity. He expressed a hope that the Americans, "should occasion arise, would always be ready to stand by" the Canadian forces. The "tremendous cheering" which this evoked must be taken as a tribute rather to the orator's pluck than to his sentiment, for even

after dinner it must have occurred to some hearers that the probable use of Canadian troops is certainly not to "stand by" those of the United States or *vice versâ*. A week later we find him laying the foundation-stone of the new University buildings at Kingston, when he told his audience how he was once snubbed by Dr. Whewell, whom his Canadian reporters ingeniously disguise under the phonetic form Hewell. The speaker had been performing the well-known exercise of exalting the virtues of Scotch students, and it occurred to him that he had once done the same to Dr. Whewell at Cambridge; whereupon said that dignitary, "Well, there is nothing to prevent you working here, is there?" In "June" (no date) he was once more military, and on the 4th of the same month he had to rub up his French in order to answer an address of the Corporation of Quebec. The reply is a highly creditable composition, containing references to Joan of Arc, to St. Bernard (on the question of whose French sermons the Marquess bravely pronounces), to Du Guesclin, and several other persons.

After this there seems to have been some kind of vacation, and it was not till September that the Governor-General again addressed his subjects. The occasion was that of a meeting of the Toronto Club, and the audience appeared to have laughed and cheered throughout the speech in the most loyal and encouraging manner. Lord Lorne on this occasion proclaimed himself, not unhappily, the "Advertiser-General" of the Dominion, and he hit upon another fancy which shows that his holidays had been well enough employed. "For every few hundred fat oxen that the Canadians sent to England, they might," he said, "calculate on getting in exchange a stout English farmer." This must be admitted to be a picturesque and not infelicitous summary of the agricultural and emigration questions, and of the relations of new and old countries. Another remarkable statement occurs in another speech delivered on the same subject in the same month. This was to the effect that by the system of farm apprenticeship, which it seems prevails in Canada, the money paid into bank as deferred wages to the apprentices is sufficient at the expiry of their indentures to set them up as cultivators for themselves. This perhaps gives a greater idea of the opening for agricultural labourers in the Dominion than any other single fact. There are one or two other speeches of the same kind in the collection which impress us with the idea that Lord Lorne is happier at such matters than when he aspires to the heights of historical allusion and anecdotic eloquence. In the speech to the Montreal St. Andrew's Society, in November last, some attempts of the latter kind seem to have been made. As Lord Dufferin used to take every opportunity for good-humoured laudation of Ireland, so his successor seems to think it his duty to pay the same compliment to his own division of Great Britain. The sober audience greeted with applause a statement to the effect that "Englishmen have for the last two centuries been so grateful to Scotland for giving them a king that they have ever since been only too happy to see Scotchmen getting their own way everywhere." The joke is not a very happy one, and the historical allusion, considering all the circumstances, is scarcely happier.

From this brief summary the trainer of Colonial Governors may obtain some idea of the accomplishments which he should aim at communicating to his charges. It is quite clear that they must be able to joke, and the inference is equally obvious that their jokes need not be too good. Perhaps Sir William Harcourt, in the continued absence of more dignified employment, might undertake the post of Professor of Political Facetiousness. They must also be proficients in the art of historical allusion, for this is at least as valuable in their case as it seemed to Major Pendennis in his education of his nephew. The allusions need not be very recondite, and perhaps they need not be strictly accurate; but they should be aptly chosen, so that the audience may at once respect the learning of their Governor and be flattered by its application. This last point indeed is, after all, the most important. The Governor (General or other) may choose his own methods of compliment, but he must be steadily complimentary. The Professor of the art of "cracking-up" should therefore be the most carefully selected and the most highly paid official of the new academy. We cannot doubt that by this time Lord Lorne perceives the inadequacy of that remark about sign-painters, and blushes at it. A few lessons from the professor would have saved him from this little slip. It is, however, more difficult than in a former case to recommend a candidate for this particular post. Mr. Gladstone would do admirably when he is in the vein; but Mr. Gladstone could hardly be expected to do anything which might tend to the conservation of our colonial empire. Besides, it is but too probable that he would occasionally teach the callow Governor to open his mouth for cursing as well as for blessing, whereas it would appear that the "proconsul" should always bless. He must bless his temporary subjects, of course; he must bless the Mother-country, with a blessing of a slightly patronizing but cordial character; and in time of peace he must bless foreign nations too, though not without a hint of the terrible things they may expect if they dare to arouse the slumbering might of the dependency over which he happens to be set. It is a moot point whether a Professor of Useful Advice ought to be added to the staff or not. His task would certainly be a delicate one, and we do not observe from the speeches before us that there is much demand for the article, at least if, in Lord Lorne's own words, we are to take his speeches as dictated by the wishes of the audiences. Still it might be argued that such a thing might occasionally be required, and that it even enters somewhat prominently into the idea of the functionary in question. This, however, may be an old-fashioned view of the subject. It is clear that, even on the ornamental theory of Viceroys, the accomplishments required of them are not few, and in some cases not easy of acquirement. Lord Lorne's ingenious idea of the "Advertiser-General" expresses this truth of itself. For it is universally admitted nowadays that advertising is a fine, a difficult, and a complicated art.

ALIEN SPIRITS.

THE repeated exposure of the gross and palpable tricks of Spiritualism has at last led to a discovery of a truly alarming character. It was at first assumed by the sceptical, and even conceded by Spiritualists themselves, that the oft-detected imposture proceeded from a purely human and mundane source. Again and again the small band of faithful believers in the efficacy of sensitive table-legs and nervous arm-chairs were compelled to confess that certain interested and unscrupulous adventurers had pushed their way into the sacred circle and were prostituting an exalted creed for the sake of personal profit. These admissions, although sufficiently humiliating at the time, were felt to be consistent with the acknowledged frailty of human nature. Nearly every great and noble movement has suffered in its progress from the unsolicited intrusion of unprincipled persons, and the occasional detection of a swindler was therefore felt to be no insuperable obstacle to the general advancement of the cause. So soon as an eminent professor of the craft was brought clearly within the range of the criminal law, his claims to the possession of supernatural power were promptly abandoned, and the veracious and truly pious Spiritualist professed to rejoice exceedingly over the exposure and expulsion of an unworthy brother. It would seem, however, from the evidence of recent events that Spiritualists have now arrived at a clearer understanding of their position. They are no longer disposed to cast the responsibility of failure upon the harmless human creatures who are good enough to devote their lives to the service of the spiritual truth. They have, to borrow a legal expression, at last decided to change the venue and to transfer the accusation of fraud to the supernatural world, where the culprit, to his own inestimable advantage, is clearly beyond the reach of the police. It would be difficult to exaggerate the benefits to Spiritualism which are implied in this revolution. Historically it will have the effect of introducing the attractive feature of martyrdom into the record of the past; for when once there is a general agreement that the medium is not to be held responsible for his acts, it will be possible to restore to the ranks of Spiritualism a number of persons who have hitherto been regarded even by the most devout as impudent impostors. This in itself is a point of some importance. During recent years detection has so nearly kept pace with achievement, that the army of Spiritualists has been compelled to sacrifice many of its most eminent and skilful leaders, and the phenomena most prized by the believer have been consequently of much rarer occurrence. But if all the frauds incidental to the progress of the movement can be confidently referred to a supernatural agency, the crop of "phenomena" will no doubt be vastly increased, and the professional medium will learn to use his power with a freedom which he has never yet enjoyed. Nor is it merely from an historical point of view that Spiritualism will benefit by the newly-made discovery. Cavillers have been wont to object that the doings and utterances of the spirit world have offered but an imperfect reflection of our many-sided human life. The messages transmitted by the mediums have seldom been witty, and have not always been wise; and not even the occasional presence of the late Mrs. Guppy has served to convince the sceptical of the solid worth of the beings with whom we are brought into communication. But if this higher sphere can be shown to be inhabited by a race of thoroughly untrustworthy spirits the cause will soon gather adherents. A realm which is deeply infected with fraud can no longer seem strange or distant to the dwellers upon earth; and although we may question the advantage of exploring such an unknown land, we cannot in conscience doubt the probability of its existence.

The announcement of this newly discovered element in Spiritualism is due to an incident which recently occurred at a *séance* in Great Russell Street. Two gentlemen, who have since reported their experiences to the public, were directed to the offices of the British National Association of Spiritualists, on the assurance that the phenomena to be witnessed at that establishment were the most genuine in London. On the occasion of their first visit the medium was tied in such a way as to be displeasing to the spirits, and no manifestation occurred; but on a subsequent evening the tying was conducted under the direction of the chairman, and as the reward of his better knowledge of supernatural affairs, a spirit soon appeared answering to the name of "Marie," and supposed to be the representative of a dead child of twelve years of age. Nothing, however, is good enough to convince the irreverent, and we need not therefore be shocked or surprised to learn that Sir George Sitwell and his companion remained unconvinced. They were even so audacious as to detect a "corset" beneath the white spiritual robes; and at a third visit, one of them, utterly forgetful of the fact that the laws of good society are equally binding beyond the grave, rushed forward to grasp the vision, when he discovered to his confusion that he was clasping in his arms the solid

form of Mrs. Corner, the medium. In an adjoining room were found dress, stockings, and boots, with "the other discarded garments" which Mrs. Corner had thrown aside, all of which were handed round "for inspection and examination by those present." On the day following the publication of these interesting particulars, a letter from the Secretary of the Association appeared in the *Times*. The facts as stated by Sir George Sitwell and his companion were not denied, and, what at the first blush would seem to render the discovery of even greater importance, it was even admitted that the medium who now confesses to a "corset" had previously been "completely and exhaustively tested by Mr. Crookes, F.R.S.," who appears never to have perceived either the "corset" or the "other garments" referred to by Sir George Sitwell. It may be that Mr. Crookes's power of detecting "corsets" is not so keen as his spiritual sense, and it is at any rate clear, upon the evidence of the Secretary to the Association, that the existence of the "corset" is not now denied.

But in the Secretary's letter there is a hint of a kind of explanation which has since been developed in the columns of the recognized organ of Spiritualism. The *Medium and Daybreak* is, as we learn from its inscription, a journal "devoted to the history, phenomena, philosophy, and teachings of Spiritualism," and it is therefore not surprising that in a periodical of such comprehensive aims some attention should be given to the unfortunate proceedings in Great Russell Street. Happily, however, the *Medium and Daybreak* has been spared any serious labour in connexion with the affair by reason of a comprehensive analysis of all points in dispute which had already been made by a distinguished Spiritualist lecturer. A certain Mr. Burns, who carries after his name the mysterious initials "O.S.T.," was called upon by an audience of the faithful recently assembled in the Quebec Hall to justify the ways of spirits to men and to explain the apparent exposure, and in the lecture which he delivered upon the occasion the existence of a fraudulent race of spirits is clearly asserted and elaborately discussed. The theory that the medium consciously acted the part of a spirit in order to impose upon the sitters is dismissed at once as an insult to common sense. "All intelligent observers of mediumship," says Mr. Burns, "will agree that under the circumstances the medium did not actually commit the act attributed to her," and there is therefore no alternative but to assume that "some spirit or spirits controlled her and effected her liberation from the fastenings in the cabinet." These spirits were, we are assured, "the real deceivers," and if we are to seek a motive for such reprehensible conduct, it is supplied by the fact that a second séance had been arranged for the same evening, and that the spirits who watched over the interests of this second séance "had used the medium as a materialization to save power." But in case this explanation should not prove entirely acceptable, Mr. Burns has yet another hypothesis equally consistent with the facts. It would appear, according to this alternative theory, that the curse of scepticism is not confined to the human race. There are spirits and spirits; and, in order to go direct to the heart of the mystery, there are spirits so entirely lost to all sense of decency as not to believe in Spiritualism. In the present case it is supposed that some of these "alien spirits," who are rightly denounced as "foes to the cause," had wrongfully "usurped the place of the regular controls," and had taken a mean advantage of the circumstances "to effect all the mischief they possibly could on the reputation of the medium and of the phenomena in general." Mr. Burns further explains in connexion with the subject that not only are there two kinds of spirits, but there are also two kinds of mediums. He divides them into the two classes of spiritual mediums and phenomenal mediums, and he does not hesitate to add that the lady with the corset was no more than a phenomenal medium. It is the peculiar weakness of the phenomenal medium that she requires "conditions"; and that, if these are not forthcoming, she is in danger of falling into bad spirit company, by whom she is led into the most embarrassing situations. Such a medium ought never to be brought into contact with "promiscuous sitters" unless accompanied by some person possessed of "the interior light." And that no such person was present at the séance in Great Russell Street Mr. Burns is fully convinced. Upon this point he will listen to no argument, for, as he justly observes, "if I see how men act, I care not for their professions," and he is persuaded that the sitters acted in such a way as to exclude the possibility of their possessing any interior light. Nor for these special objects of Mr. Burns's contempt do we feel any kind of pity. Our sympathies go rather with the lady who by such a trifling article of dress as a corset has been suddenly degraded to the rank of a merely "phenomenal medium." A more pitiable fate than that of a phenomenal medium can indeed scarcely be conceived. To be caught and detained in the arms of an earnest inquirer is bad enough; but to be held in bondage by spirits who have no belief in Spiritualism is indeed a terrible termination to an otherwise brilliant and blameless career.

INSURANCE COMPANIES' PREMIUMS AND EXPENSES.

THE *Statist* of Saturday last contains an elaborate article on Insurance Companies which is eminently deserving of the attention of intending insurers. It is founded on the returns furnished by the Companies themselves to the Board of Trade, and compares the premiums charged by ninety-two of these Companies at the several ages from 26 to 41, both inclusive, as also the proportion borne by the expenses to the premium income. The importance of these two points in attempting to understand the position of an Insurance-office is obvious. The premium is the annuity paid by an insurer in consideration of the payment to his representatives of a larger sum at a future specified time; and clearly it ought not to exceed what is requisite to discharge the liabilities of the insuring Company, to cover the legitimate current expenses, and to leave a reasonable profit on the capital invested. If it does more than this, the insurer gets less than justice; unless, indeed, he receives advantages over and above the policy for which he contracts. A Company, for instance, may charge too high a premium, but may return the excess in the shape of bonuses, or may periodically increase the amount assured by the policy. In such a case the apparently high premium may not in reality be so. Again, a Company charging a high premium may manage its affairs so well that the security acquired may not be too dearly bought by the additional payment. These are points which the intending insurer should carefully consider for himself. But, other things being equal, it is manifest that the smaller the premium the greater is the advantage to the insurer. As regards the second of the two points we have mentioned, it is clear that the larger the proportion borne by expenses to the premium income the less advantageous is the position of the Company. If, for example, the expenses of one office amount to no more than 5 per cent. of its premium income, while those of another are as much as 15 per cent., the latter, supposing the incomes in both cases to be equal, has 10 per cent. less than the former wherewith to meet its liabilities. Here again, however, we must make some allowances. Thus a new Company, while it is acquiring business, has to incur a considerable outlay, which from the nature of the case must bear a high proportion to the premium income. Even among old-established Companies, it is only fair to observe, those which charge low premiums may appear to be spending a larger proportion of them than those which charge high premiums. For the sake of illustration, let us suppose two offices, one charging 2*l.* 10*s.* per annum to insure 100*l.* at death, the other charging 3*l.*; and let us suppose further that the expenses of each office amount to 5*s.* for every 100*l.* insured. The proportion of expenses to income in the first case is 10 per cent., in the second only 8⅓ per cent., yet the cost of obtaining the business is precisely the same in both. We must not, however, attach too much importance to this, for in the cases here assumed the dearer Company charges 20 per cent. more than the cheaper, although the difference in the proportion of expenses to income is only 1⅔ per cent. Besides, it is plain that the smaller the revenue the greater the need for economy. It will be seen, then, that the excess in the premium must be very large indeed to cause an appreciable diminution in the proportion of expenses to income. With these introductory remarks we pass on to notice the results brought out in the *Statist* article.

That article, as we have said, analyses the returns to the Board of Trade of ninety-two Companies, omitting the remainder either because they take weekly payments, or because of other difficulties in working out details; and it compares the premiums charged from the age of 26 to 41, as well as the proportion of expenses to premium income. The premiums in every case, we should add, are the "with-profits" premiums, these comprising the great bulk of insurance business. The writer admits that, to be scientifically accurate, he ought to have included all ages in the comparison; but statistics do not exist that would enable him to do so, and the ages which he chooses are practically the insuring ages. In order to present the results in a form that will be readily apprehended by his readers and not encumber his columns with too great a mass of figures, he has added together the premiums at each age, sixteen in all, and divided them by sixteen to get the average or mean. The results arrived at are curious. Confining ourselves in the first place to the premiums, we find that the 92 Companies fall into five classes, of which there are 14 in the first and 8 in the last, the great majority being in the three intermediate classes. The 14 Companies in the first class have an aggregate premium income of 2,424,812*l.*, and the mean annual premium to insure 100*l.* at death with profits exceeds 2*l.* 16*s.* 3*d.* But although we have followed our contemporary in classing those 14 Companies together, we should be ourselves inclined to place the first on the list in a category apart. For its mean annual premium is as high as 3*l.* 2*s.* 10*d.*, that of the next on the list being only 2*l.* 18*s.* 5*d.*, and, as we have seen, the average of the 14 being no more than 2*l.* 16*s.* 3*d.* In the second class there are 26 Companies, with an aggregate premium income of 4,563,109*l.*, whose mean annual premium is between 2*l.* 15*s.* and 2*l.* 16*s.* 3*d.* In the third class there are 33 Companies, with an aggregate premium income of 3,114,910*l.*, whose mean annual premium is between 2*l.* 13*s.* 9*d.* and 2*l.* 15*s.* In the fourth class there are 11 Companies with an aggregate premium income of 1,036,124*l.*, whose mean annual premium is between 2*l.* 12*s.* 6*d.* and 2*l.* 13*s.* 9*d.* And in the last there are 8 Companies, with an aggregate premium income of 1,024,795*l.*, whose mean annual premium does not exceed 2*l.* 12*s.* 6*d.* Here, as in the first class, we have to note considerable divergence, the mean annual income of the last upon the list being as low as 2*l.* 6*s.* Broadly, then, the result brought out by this analysis is that the bulk of the Companies making up the three intermediate classes, 70 in number, with an aggregate premium income amounting to 72 per cent. of the total, do not differ very widely from one another in their charges, the variation in the mean being only from 2*l.* 16*s.* 3*d.* as a maximum

to 2*l.* 12*s.* 6*d.* as a minimum, or barely 6½ per cent. But the variation between the first and the last class is very considerable. The difference, for example, between the highest and the lowest is 14*s.*, which would amount in the case of an insurance of 1,000*l.* to 7*l.* The conclusion to be drawn from all this clearly is that, as regards the great majority of offices, a prudent man will pay but secondary attention to the rates of premium when considering with which Company he ought to insure. He will inquire rather into the management; he will ask whether the risks run are very great, whether the investments are sound, and whether the income is earned at a large or a small outlay. But as regards the offices included in the first and the last classes the case is different. The divergence in them is too great not to provoke inquiry. If the premiums charged by the 8 companies in the fifth class are sufficient, those charged by the 14 in the first class must be very much more than sufficient. And a prudent man will desire to know why this is so. We offer no opinion ourselves upon the matter. For the present we are only calling attention to a difference of practice which invites comment. It would be easy no doubt to suggest explanations. It may be said, for instance, that the high premiums are deliberately charged for the purpose of making it possible to declare large bonuses, while the low premiums are calculated simply to carry out literally the contract entered into. In such a case an insurer might very possibly prefer the office charging the higher premium. But our present object is only to draw attention to the facts as we find them, and therefore we refrain from examining this and similar explanations.

Turning now to the proportion borne by the expenses to the premium income, we find the differences much more startling and serious, ranging from 3·9 per cent. up to 75 per cent. Omitting such exceptionally high proportions as 75 and 50 per cent., we find not a few cases where it amounts to 21, 23, 25, 27, and 34 per cent.; while at the other end of the scale we find a great number no higher than 5, 10, and 15 per cent. We do not say that there may not be good reasons for these differences; but a sensible man will require to know what the reasons are before he deals with the former class of offices. His object is to make a provision for his wife, should she survive him, and for his children, especially his daughters; and management which uses up a quarter or one-third of the premium income in earning it is hardly calculated to attract his confidence. If Companies of high character doing a large business are able to defray their expenses with 5 per cent. of their premium income, it is difficult to understand why others should need to spend 20 or 30 per cent. We have already admitted that new Companies must be excepted, and there may be cases where old established Companies are enlarging their business, and are legitimately incurring a largely increased outlay. But we must plainly add that the number of offices showing a high proportion of expenses to premium income is so great as to render this explanation not very probable in every case. At the same time we must not be understood to imply that a high proportion of expenses to premium income is necessarily conclusive against the management of an office. There are other things to be considered, as, for example, the nature of the risks undertaken. All we say is that a heavy expenditure *primâ facie* tells against the management, and ought to warn an intending insurer to inquire very narrowly into the position of the Company. It suggests either extravagance, waste, and absence of efficient supervision, or else a difficulty in obtaining business, so that exorbitant commissions have to be paid to agents to bring it in. The suggestion may happen to be quite unfounded, and the Company may be perfectly safe; but the general public have little means of forming an intelligent opinion on such points, and can only apply such tests as are furnished to them.

OLD MASTERS AT THE ROYAL ACADEMY.—II.

THE collection of pictures in the Fourth Gallery at Burlington House, which is devoted to the works of "Holbein and his School, &c.," is, as we said last week, full of attraction. Perhaps the most interesting of many admirable specimens of Holbein's work is the "Portrait of Christina of Denmark, Duchess of Milan" (177), which is a full-length picture hung close to the ground, a method of somewhat doubtful advantage. The picture is thus described in the Catalogue:—"Daughter of Christian II. of Denmark and niece of the Emperor Charles V., married Francesco Sforza, Duke of Milan, who died 1535, when she was about fourteen. On the death of his third wife, Jane Seymour, in 1537, Henry VIII. opened negotiations with the Emperor for her hand, and Holbein was sent to Brussels for the purpose of taking her portrait for the King; a letter from John Hatton, English Minister at Brussels, to the Lord Privy Seal, Lord Cromwell, dated March 14, 1438" (this is of course a misprint for 1538) "gives an account of Holbein's interview with the Duchess, and states that he did a sketch of her in three hours; in a previous letter, dated December 9, 1537, Hatton thus describes her:—'I am informed she is of the age of sixteen years, very high of stature for that age. She is higher than the Regent, a goodly personage of body, and competent of beauty, of favour excellent, soft of speech, and very gentle in countenance. She weareth mourning apparel after the manner of Italy.'" The portrait corresponds closely enough to this vivid description of the personage. It is not of course to be supposed that the portrait which we now see was the one which "Mr. Hance," as Holbein is called in Hatton's letter, executed when, "having but three hours' space," he "showed himself to be master of that science." That was probably a drawing like those in the Royal collection, many of which have been lately seen both at Burlington House and at the Grosvenor Gallery. It is unfortunate that the face in the finished work has been injured, so that the modelling is spoiled; but the expression remains, and gives one the idea of a singularly attractive person, with quite enough wit, notwithstanding her gentleness, to have made the reply to Henry's offer which is attributed to her, "that she had only one head; if nature had endowed her with two, one should have been at his Majesty's disposal." The painting of the figure, with the varying textures of the dress, is an admirable example of Holbein's work. The oddly opaque blue of the background, entirely unlike the bright and airy colour frequently employed by this master, is probably due to the incompetence of a cleaner.

The place corresponding to that of this picture is on another wall occupied by a full-length picture of Sir Thomas Gresham (165), founder of the Royal Exchange, which is described in the Catalogue as belonging to the "School of Holbein." The figure, with its black dress, its somewhat melancholy look, and the skull on the ground, has an odd suggestion of Hamlet in the grave scene. There seems to be good ground for supposing, with Mr. Scharf, that the picture was painted by Girolamo da Treviso. To the same painter, or to Bartolomeo Penni, one contemporary critic ascribes the "Portrait of William West, 1st Lord Delawarr" (167), which the Catalogue assigns to Holbein. Another critic points to certain resemblances in the workmanship to that of Van Cleeve, and the late Mr. Wornum thought that it might have been by Strete. The portrait is fine and impressive in attitude and expression. Close to this are two fine specimens of Pourbus, "Robert Dudley, Earl of Leicester" (164), and his brother, "Ambrose Dudley, Earl of Warwick" (166), a personage of a very marked, but by no means attractive, expression, which seems to have been caught to the life by the painter. A full-length portrait of Edward VI., when Prince of Wales, at the age of two, by Holbein (163), has been greatly injured, but its beauty and truth are still apparent. One of the finest examples of the master's work seen in this gallery is the "Portrait of Sir Henry Guildford" (174), which is full of expression and is painted with a magnificent freedom and accuracy. The elaborate painting of the dress and its ornaments, which are, however, completely subordinated to the impressive face and bearing of their wearer, is highly remarkable. The companion portrait of Lady Guildford (171) is also striking, but has been unfortunately injured. As striking in some ways as the portrait of Sir Henry Guildford is that of Sir Brian Tuke (188), Secretary to Wolsey and Treasurer of the Chamber to Henry VIII. In this the treatment of the dress and ornaments is extraordinarily fine and careful.

There are in this gallery two works attributed to Joas van Cleeve, one of which, "Portrait of a Man" (206), passed for some time as a Holbein. The other, a portrait of the painter by himself (160), is a fine specimen. Attention should also be given to several specimens of Clouet, which it will be interesting to compare with the work of the greater painter. The gaiety which belongs to them is curiously and pleasantly characteristic of the painter's nationality. Some little Cranachs also have an interest of their own.

The fifth gallery contains one work of exceptional value and beauty—a panel, "Virgin and Child" (223), by Piero della Francesca. Panels by this master are excessively rare—indeed not more than half-a-dozen are known to exist. This one is of unquestionable authenticity, and though much injured both by dirt and fading, is free from repainting, except where it has been necessary to fill in a comparatively narrow strip on the extreme right of the picture. This has been done with the utmost care and skilfulness, and a thin faint line of gold has been employed to indicate the boundary between the original and the supplied portion. The picture is remarkable for the unconventional beauty of its grouping and for its fine feeling and expression. It is further noteworthy as one of the examples of the transition period when two vehicles were employed—tempera for the flesh tints, which accordingly have faded to whiteness, and the then new vehicle of oil for the rich textures and tissues.

This room contains, amongst other things, four pictures by Botticelli (212, 213, 253, 254), which illustrate one of the novels in the *Decameron*. They are thus described in the Catalogue:—"Nastagio degli Oresti, being in love with a daughter of Paolo Traversaro, has his suit rejected, the family of the lady being nobler than his own. He accordingly leaves Ravenna for Chiassi; and one day, while walking disconsolately in the pine woods, sees the apparition of a naked lady pursued by a horseman and dogs. He endeavours ineffectually to defend her; but the horseman dismounts, and plunging his sword into her body, tears out her heart and throws it to his dogs, who devour it (253). He then tells Nastagio that she has to suffer this punishment on the same spot every Friday for her cruelty to him when alive. Nastagio, thinking it would be a warning to his own mistress, invites her to a feast in the woods on the following Friday, and the same apparition then appears, to the great terror of the guests (213). His mistress relents, and consents to marry him; and the wedding feast is afterwards held at Ravenna in the palace of the Traversari" (254). The pictures originally belonged, oddly enough, to *cassoni* or marriage chests; and they have a quaint and curious interest, the one depicting "the great terror of the guests" being

from an irreverent point of view especially pleasing; but it is unfortunate that they have been almost entirely repainted. The extraordinary variety, however, of expressions which now seem oddly out of keeping with the circumstances of the disturbed festal party can hardly have been greatly altered. Not far from these works hangs a "Battle Scene" (219), full of vigour and movement, attributed to Pisanello, and representing probably a Roman engagement with Pyrrhus. It is curious to note in this the painter's sublime rashness in attempting to put into his work more than any picture can possibly contain. A "Virgin and Child" (225), ascribed to Lionardo, has extreme beauty and tenderness. The "Fable of Cupid and Psyche" (227), assigned to Filippo Lippi, might probably be attributed with better show of reason to Filippino; and a portrait (233), ascribed with a necessary query to Raffaelle, is an interesting specimen of the Florentine school. A "Judgment of Solomon," ascribed also with a query to Wohlgemuth, probably does not belong to the Nuremberg school at all, but has some points of strong resemblance to the work of Lucas van Leyden. Three religious pictures (244, 245, 248) of the "Early Castilian School"—that is, of Flemish origin or inspiration—are in their way exceedingly interesting, but the way is one of curiosity rather than beauty. The "Portrait of Don Francesco de Ribas" (242) is a fine and impressive example of Velasquez. It is odd to find a picture, "Portrait of Edward VI. on Horseback" (237), assigned without a query to Holbein, placed in this room far away from all other genuine or doubtful Holbeins; but it is not perhaps difficult to imagine reasons for this at first sight startling condition of things.

The exhibition has, it will have been seen, some points of unusual interest, and certainly does not suffer in attraction from not being inconveniently large.

THE CARL ROSA OPERA COMPANY.

MR. CARL ROSA has once more undertaken a season of opera in English at Her Majesty's Theatre; and, as usual, his programme is of much interest. Unfortunately Mr. Rosa is unable at present to undertake the active supervision of his enterprise; but he has been happy in putting the duties of musical director into the hands of Signor Randegger, who, long known to the English lovers of music as one of the ablest singing-masters in this country and a clever conductor of musical festivals, now shows himself to be an operatic conductor of rare ability. He directs an admirable band, having Mr. Carrodus as first violin, and a chorus of good voices well trained; and both band and chorus are completely under his control. We ought therefore rather to rejoice that Mr. Mapleson did not carry out his intention of producing Herr Hermann Goetz's *Taming of the Shrew* during the late series of Italian opera at cheap prices, and that it should have been left to Mr. Rosa to introduce this work to a London audience. For the performance of this opera on Tuesday evening may be called the first in London, though we believe it was produced some time ago at Drury Lane; but it excited no interest, and comparatively few of the English public have ever even heard that the Drury Lane representations were given.

The German libretto is by Herr Joseph Victor Widmann, who has treated the original play with the greatest freedom, and, from an operatic point of view, with judgment and dramatic skill. The characters are reduced to Baptista, Katharine and Bianca, Hortensio and Lucentio, Bianca's suitors, and Petruchio; Grumio and a tailor being also introduced. The opera opens in front of Baptista's house with a serenade to Bianca by Lucentio, which is interrupted by a chorus of Baptista's servants who are in rebellion against Katharine's temper. Baptista attempts to pacify them. Katharine appears on the balcony and increases the confusion by her taunts. The neighbours appear at the windows and remonstrate. At last the servants accept Baptista's offer of more pay and more wine, and retire. Lucentio resumes his serenade; Bianca comes to the window. This love scene is interrupted by Hortensio, who comes with a band of musicians also to serenade Bianca. The rivals quarrel. Baptista again comes out, and finally declares to the two suitors that Katharine must be married before Bianca can be wooed. Each of the suitors then determines to get access to the house as a tutor to Bianca, and so gain an advantage over his rival. Petruchio now enters and determines to marry Katharine.

The second act follows the original play more closely. The first scene is between Katharine and Bianca. Petruchio presents himself to Baptista as a suitor for Katharine's hand, and introduces Hortensio and Lucentio in disguise as tutors for Bianca. They go to the garden to look for their pupil, and Baptista then warns Petruchio of his daughter's character. Hortensio comes in with the lute broken around his neck, and Petruchio is left alone. Katharine comes in, and the scene between them is much the same as that in the play, which again is closely followed in the last scene of the act in which Petruchio tells Baptista that he has gained Katharine's consent to the marriage, the only important variation from the original being that Katharine's words are made to show that Petruchio is really gaining her heart. The second act shows the guests assembled for the wedding. They are dismissed by Baptista on account of Petruchio not having arrived, and then the lesson scene between Bianca and her tutors takes place, interrupted by the arrival of Petruchio and Grumio. The guests reassemble and go off to the wedding, and the rest of the act follows the play. The last act is at Petruchio's house, the incidents of the dinner being shown. The tailor enters, and after the scene with him Katharine's taming is complete. Baptista arrives with Lucentio and Bianca, who are now married, and the opera ends. The opera, of course, has a better effect in English than it could have in a foreign language. Perhaps only those who in a long course of opera-going have sounded the depths of imbecility of the ordinary libretto are likely to appreciate the value of the version which is used, written by the Rev. J. Troutbeck, M.A. The language is clear and intelligible, the words are so well adapted to the music that the singers are able to use them unaltered; indeed, if we compare Mr. Troutbeck's work with the original German libretto, we find that he has followed it almost syllable by syllable. In fact, Mr. Troutbeck has accomplished a difficult task in a manner which shows him to be a fluent writer, and to have a real feeling for music.

To describe or criticize Herr Goetz's music is no easy task; but even a first impression shows us that it is worthy of the high opinion which has been formed of it in Germany, where the opera is now well known. Even without analysis of the deeper beauties of the work, its dramatic character alone interests and charms. Every bar has its meaning and expresses the intention of the words, and above all there is the stamp of originality on the whole opera. The music is unconventional, and Herr Goetz has succeeded in writing true music of comedy, a task in which so many great composers have failed; but whilst he has a keen sense of musical humour, it never leads him into the trivialities of opera bouffe, and his music in the more serious and tender situations is full of poetry and charm. It is here that he reminds us most of Herr Wagner—not that there is any servile imitation, but that he employs similar melodic forms, if we may venture to use the words "melodic" and "form" in connection with the works of that composer. But otherwise Herr Goetz no more follows Herr Wagner than he does any other musical writer; and, in spite of some few startling harmonies, is generally content to obtain his dramatic effects by more ordinary and time-honoured means. And, whilst he gives its full value to the orchestra, he yet treats the voices as of more importance than mere additional instruments in the band.

The music is decidedly not of a "popular" character. There are few airs or phrases which can be carried away, and we may hope to be spared the infliction of such works as the "Katharine Quadrilles" or the "Petruchio Waltzes." But we think that the more frequently it is heard, the more its many beauties will grow upon the hearer; and we believe that there is a sufficiently large audience of lovers of true music in England to make the success of the opera almost as great in this country as it has been in Germany. That no difficulties of musical composition can hamper Goetz when he has an idea to carry out is shown very early in the opera, where we have the angry chorus of Baptista's servants, Baptista's soothing words, Katharine's taunts, and the quartet of neighbours remonstrating all carried on at once, all distinct, and all full of individual dramatic character. But he uses this facility of composition only to produce dramatic effect, and never for display. Thus during the boisterous scene at the beginning of the last act, when Petruchio is whipping the servants and throwing the plates and dishes about the room, Goetz makes no attempt at elaborate writing, which would be lost in the bustle, noise, and excitement on the stage, and contents himself with a slight orchestral indication of the scene. The composer is sparing in his use of *leit motivs*—too often a cloak for poverty of invention—the only one which forces itself on the hearer's notice being the opening phrase of Petruchio's air in the first act, "She is a wife for such a man created," which is freely used afterwards to indicate Petruchio's success. He has also written a true overture to the opera, instead of a mere *pot pourri* of the principal airs—another device by which some composers, under the pretence of making their work intelligible and popular, contrive to make a very little original thought go a very long way.

The opera was admirably performed, under the direction of Signor Randegger; and it was scarcely possible to believe that it was a first night of so difficult a work. Band and chorus were alike admirable, and perfectly under command; whilst the singers were all good, and, thanks to proper study and rehearsal, were enabled to entirely conceal the nervousness which artists must always feel on the first night of a new work. The Katharine was Miss Minnie Hauk, and her popularity certainly helped the success of the opera. We have heard that she sang the part when the opera was first produced in Germany, and that some of the music was written for her. Her conception of the character is rather petulant and undignified; but, conception apart, she played the part well and with much dash and fire. Her vocalization we have often spoken of, and we find it unchanged. But there is one serious blot upon her performance which, if she hopes to be successful in opera in English, Miss Hauk should try to wipe out; that is, that she does not pronounce her words at all, and appears to be singing in some entirely unknown tongue. This is the more to be regretted as the other members of the company articulate with unusual distinctness. Miss Georgina Burns sang Bianca, and showed herself to be a florid soprano of great skill, having a beautiful voice and singing with much expression and feeling. Mr. Walter Bolton sang Petruchio; he has a fine barytone voice and a strong manly style of singing which lent itself well to the music; his acting also was satisfactory. The rest of the cast was as follows:—Baptista, Mr. Snazelle; Hortensio, Mr. Leslie Crotty; Lucentio, Mr. Fred. C.

Packard; Grumio, Mr. T. Law; and a Tailor, Mr. Charles Lyall. Mr. Packard has an agreeable tenor voice, which unfortunately is already attacked by the destroying tremolo; but for this he sings well. Mr. Betjemann must be congratulated on his stage management and wonderful power of drilling chorus singers; his crowds look like real crowds, and are not mere rows of motionless figures. Mention may specially be made of the end of the second act, where the guests and servants try to prevent Petruchio from carrying off Katharine before the wedding feast, whilst he and Grumio drive them back with their swords; the lifelike rushes at Petruchio and terrified flights when he threatens were as good examples of skilful and artistic stage management as we could wish to see. In fact, the work was presented to the public in a manner worthy of Mr. Carl Rosa's reputation as a manager.

REVIEWS.

MEMOIRS OF METTERNICH.*

(*First Notice.*)

THE present fragment of autobiography is in a high degree valuable and interesting, though the contents scarcely correspond to the title. Of some parts of his diplomatic and political career Prince Metternich wrote detailed accounts, and the second volume contains a large number of despatches which in some instances supply omissions in the Memoirs; but there is no continuous narrative, and many great historical events scarcely receive passing notice. Prince Richard Metternich has taken an extremely modest view of his duties as editor. He has seldom or never supplied the deficiencies which he found in his father's desultory notes; but his publication, if not complete, is thoroughly authentic, and it forms an important contribution to the history of Napoleon's time. Prince Metternich was not only one of the foremost statesmen of his age; he had a taste for art and science; he was an accomplished member of society, and his Memoirs show that he possessed no ordinary ability as a writer. His studies of the characters of Napoleon and Alexander I. would not have been unworthy of St. Simon. He is probably justified in stating that no other person, not being a Frenchman, had equal opportunities of becoming acquainted with Napoleon; and he attributes to his use of the facilities which he possessed no small share in the final defeat of the Emperor's designs. Referring to Napoleon's invitation to himself to come as Ambassador to Paris, he complacently says, "I do not think it was a good inspiration of Napoleon's which called me to functions which gave me the opportunity of appreciating his excellences, but also the possibility of discovering the faults which at last led him to ruin, and freed Europe from the oppression under which it languished." Both the Memoirs and the despatches contain many striking illustrations of Napoleon's character and methods of proceeding. The story of his famous interview with Metternich at Dresden in 1813 is for the first time told in vivid language with elaborate detail. Frequent reports from Paris to the Court of Vienna of the Emperor's calculated outbreaks against different Envoys at his diplomatic receptions are equally instructive. Of the audacious mendacity which is attributed to him by his old acquaintance two examples may suffice. After the battle of Wagram he induced Prince John of Lichtenstein who, as he knew, had no authority to negotiate, to sign a project of peace, to be submitted to the Emperor Francis, which Napoleon immediately declared to be a treaty with Austria. He instantly ordered the guns to be fired in celebration of the conclusion of peace; and the Emperor Francis and his Minister feared to provoke the disappointment which would have been caused by an announcement of the truth. The Memoirs contain an account given to Prince Metternich by Cardinal Consalvi of the deception which was practised on the Pope when he came to Paris for the coronation of the Empress. As Josephine, having been married only by civil contract, was not, according to the rules of the Church, a lawful wife, no intimation was made that she was to be crowned till the evening before the ceremony. The Pope positively refused to appear if Josephine was to be crowned, until two or three French bishops, sent by the Emperor, assured him with deliberate falsehood that the marriage had been performed according to the rites of the Church. French historians speak of a ceremony of marriage of which Metternich seems not to have heard, performed by Cardinal Fesch on the eve of the coronation. They add that when it became convenient to obtain a divorce some informality in the proceedings was discovered, although the Cardinal insisted that they had been perfectly regular. At a later time, when the Court of Rome was requested to sanction the marriage of Maria Louisa, the true account of a merely civil marriage with Josephine was of course revived.

With a period of more than thirty years after the fall of Napoleon, during which Metternich was one of the principal directors of European politics, the present portion of the Memoirs has nothing to do. Europe was largely indebted to him for the longest peace of modern times; and, on the other hand, his domestic policy in Hungary and in Italy ended in confusion and disaster. When his apology for the later and longer part of his career is published, he will probably be found not to have attributed to himself any responsibility for failure. Confident in the principles which he consistently maintained, he seems also to have been thoroughly satisfied with himself. Guizot himself was not in his own estimation more incapable of obliquity or of error, though it may be admitted that Metternich's self-approval is less obtrusive than the vanity of the austere French intriguer. Scarcely any statesman found the accesses to rank and power so open and so easy. His father, Francis George Count Metternich, was Austrian Ambassador to the Diet when Leopold II. was crowned at Frankfort, and the son, Count Clement, at the age of seventeen, was already representative of the Westphalian Courts of the Empire. Soon afterwards the elder Metternich became Ambassador to the Estates of the Austrian Netherlands, an office which really was that of Prime Minister or Regent of the provinces. The son, who had been carefully educated at Strasburg and Mayence, was employed by his father in State business at Brussels, and in 1794 he became acquainted during a visit to England with George III., the Prince of Wales, and the leaders of both political parties. He ventured to remonstrate with the Prince, whom he greatly admired, on his alliance with the Opposition, and twenty years afterwards the Regent reminded him of the conversation, and told him that he had been perfectly in the right. He was on board Lord Howe's flag-ship on the 30th of May, when the Admiral, in spite of his entreaty, sent him on shore, on hearing that the French fleet had issued from Brest. He stayed at Portsmouth till the shattered fleet returned in triumph after the victory of the 1st of June. On his return he found that the Austrian Government had been compelled to retire from the Netherlands; and he was himself unable to enter on the post of Ambassador Extraordinary at the Hague, to which he had been appointed at the age of twenty-one. By the French occupation of the left bank of the Rhine his family had lost their principal estates, including the titular castle of Metternich. A property in Bohemia remained, and at the subsequent peace of Luneville the abbey of Ochsenhausen was awarded to them in compensation for their losses. Francis II., who had now succeeded Leopold, raised the new possession to the rank of a principality, and some years afterwards Metternich declined an offer of Napoleon's to raise him to the rank of a sovereign member of the Confederation of the Rhine. In the autumn of 1794, on a first visit to Vienna, he found that his parents had arranged for him a marriage with a daughter of Prince Ernest Kaunitz, eldest son of the celebrated Chancellor. By an odd coincidence the wedding, which was deferred till 1795, took place at the then unknown village of Austerlitz. Metternich declares, apparently without conscious insincerity, that the public service had then no attraction for him. "I had determined to remain in private life, and to devote my time to the cultivation of learning and science." One of his reasons was that, in his judgment, public affairs in Austria were not well conducted. "Inaccessible to prejudice, and seeking only the truth in everything, my modesty did not allow me to find fault with persons in power if I was not satisfied with what I saw." His disapproval of the policy of his Government was therefore, he says, ascribed to the weakness of his own understanding; "and, on the whole, my particular vocation seemed to me to be the cultivation of knowledge, especially of the exact and physical sciences, which suited my taste particularly." He had also some knowledge of art, and he was a respectable performer on the violin. Destiny had not intended him for a student and amateur. The Emperor Francis, to whom he communicated his desire of a private life, told him that he might do as he liked for the present, but that he must be prepared to obey his orders. It is difficult to believe that, after fifty years of all but supreme power, Metternich should have regretted his failure to become a third-rate chemist.

He makes no secret of the qualifications for public life which he knew himself to possess; and, if possible, he relies more on his moral excellence than on his sagacity and prudence. The composition of the *Memoirs* was itself prompted by a sense of duty. He undertakes to point out to his descendants "the course by which alone the conscientious man can withstand the claims of time. This course I have indicated by the motto I have chosen, as the symbol of my conviction, for myself and my descendants—*True Strength lies in Right*. Beyond this all is transitory." The same doctrine is elsewhere expounded in full detail, leading to the conclusion that

> when we master these truths what becomes of a selfish policy, of the policy of frontiers, or of the policy of miserable greed, and especially what becomes of that which seeks profit apart from the simplest rules of right, which mocks at the plighted word, and, in short, rests solely on the usurpation of force and craft? After this confession of faith it may be conceived what I have always thought of the politicians of the stamp, or, if we will, of the authority of a Richelieu, a Mazarin, a Canning, a Capo d'Istria, or a Haugwitz.

Canning's name will be seen with some surprise in the list of dishonest statesmen, though the enmity between him and Metternich is well known. It may perhaps have been against the wish of the Austrian Chancellor that Prince Esterhazy concurred with Prince and Princess Lieven in the intrigue against the Duke of Wellington which produced a reconciliation between Canning and George IV. It is edifying to listen to the virtuous sentiments of the veteran master of statecraft who seldom received credit for disinterested simplicity.

* *Memoirs of Prince Metternich*, 1773-1815. Edited by Prince Richard Metternich. Translated by Mrs. Alexander Napier. 2 vols. London: Richard Bentley & Son. 1880.

In 1801, at the age of 28, Metternich was appointed Austrian Minister at Dresden; and in 1803 he was transferred to the more important mission at Berlin. The renewal of the war between France and Austria was already impending, and both the Austrian and the Russian Governments were anxious to have the co-operation of Prussia. Count Haugwitz was devoted to the interest of France, and the two Cabinet Secretaries, Lombard and Beyme, were, according to Metternich, whose statement is confirmed by other authorities, in the pay of Napoleon. The King, anxious only to maintain his neutrality, inclined to the French party, while Hardenberg gave all the aid in his power to Metternich. The Emperor Alexander nearly drove the King into alliance with France by an ill-advised threat of violating Russian territory; but Napoleon anticipated him by occupying the Prussian Margravate of Anspach, and the King reluctantly signed the Treaty of Potsdam, by which he bound himself to join the Allies. Haugwitz, who took the document to Vienna, having delayed its presentation till after the battle of Austerlitz, instead of discharging his mission, went to Napoleon's head-quarters to congratulate him on his victory. In the next year the defeat of Jena and the dismemberment of the Prussian monarchy formed an instructive comment on a policy of cowardice. On the conclusion of the Peace of Presburg Metternich was appointed Ambassador to St. Petersburg, in the place of Count Stadion, who became Prime Minister; but about the same time Napoleon, on the recommendation of Talleyrand, intimated his wish to receive Metternich as the Austrian representative at Paris. During a residence of four years he attained a certain intimacy with the Emperor, though he was exposed to occasional bursts of calculated violence; and he was incessantly occupied in preparing for another war, which he saw to be inevitable. The independent and suggestive tone of his correspondence with Stadion shows that the young diplomatist had acquired the full confidence of his Government. After the Treaty of Tilsit he watched the policy of Russia as anxiously as the designs of France; and when Napoleon engaged in the criminal folly of his Spanish enterprise, Metternich began to hope that the liberation of Europe was approaching. In one of his despatches to Stadion he remarks on the uniform result of all the varying systems of policy which had been adopted by different States in their relations with France. Austria, in a long struggle with an open enemy, had been at last defeated. Prussia, after twelve years of deferential neutrality, had been crushed. Finally, Spain, which had placed the national resources at the disposal of the French Emperor, had been treacherously deprived of independence. If he had been writing a political essay instead of an official despatch, Metternich would perhaps have included England among his illustrative examples. If English policy had then been directed by statesmen of the school of Mr. Bright and Lord Derby, the country would only have been saved from subjection by some desperate popular reaction. Napoleon would have required as a condition of peace the reduction of the navy; and compliance with his demand would have been followed by a quarrel and a war of invasion. It is nevertheless remarkable that he once told Metternich that the assemblage of the army at Boulogne was from first to last a feint. Metternich replied that he had himself never doubted that the French preparations were made against Austria, and not against England.

The war of 1809 put an end to Metternich's mission at Paris; and two days after the battle of Wagram, at which he was present in attendance on the Emperor, he succeeded Count Stadion as Prime Minister. One of his first occupations was to negotiate the marriage of Napoleon with the Archduchess Maria Louisa; and he gives the most authentic account of that singular transaction. The first overture was made by Napoleon himself at a masked ball to the Countess of Metternich, who had remained at Paris during the war; but the Government at Vienna had already received an intimation of the scheme through a French agent. In the interview at Dresden in 1813 Napoleon appears to have told Metternich that the marriage had been a blunder; and Metternich, according to his own account, replied that he agreed with the Emperor. Its chief effect was to furnish an additional ground of dissatisfaction to the Emperor Alexander; but there is little doubt that the war with Russia would in any case have occurred. At his own request Metternich went to Paris on pretence of attending the Empress, but with the real purpose of ascertaining whether Napoleon still intended to continue and extend his conquests. After long expectation, in September 1810, he was asked whether Austria would consent to exchange Galicia for a restoration of Illyria and Dalmatia. Metternich at once wrote to Vienna that Napoleon had resolved on war with Russia, but that it would not begin till 1812. He immediately returned to his post as Prime Minister, and prepared incessantly for the struggle which had now assumed a hopeful aspect. In 1813 he was able to offer Napoleon the armed mediation of Austria and to tell him on his refusal that he was lost. Two days afterwards he assented, and Metternich, having learned that Prince Schwartzenberg wished for a delay of twenty days before beginning the campaign, agreed to renew the negotiation. The 10th of August was fixed as the date at which the choice between mediation and war should be made; but Caulaincourt affected not to have received his credentials which arrived on the 12th. On the night of the 10th Metternich ordered the beacons on the frontier of Bohemia to be lighted, and the Austrian army joined the allies. Of the campaigns of 1813 and 1814 and of the Congress of Vienna Metternich had not undertaken to write the history. It may be worth while in another article to notice separately some of the episodes in his narrative, and especially the judgments which he formed of the sovereigns and statesmen with whom he was brought in contact.

PUBLICATIONS OF THE EARLY ENGLISH TEXT SOCIETY AND OF THE ENGLISH DIALECT SOCIETY.*

THE editor of the *Lay Folk's Mass Book* is fully justified in saying that the publications of the Early English Text Society do far more than fulfil their primary purpose of illustrating the course of the English language. Some of them have scarcely less value for the historian than others have for the comparative mythologist; and the four texts brought together by Canon Simmons possess an interest far beyond that of the dialectic forms which they exhibit, although the changes which converted a Northern into a Midland poem are themselves sufficiently remarkable. The Layman's Mass-book challenges our attention chiefly as throwing light on the spiritual condition of the laity during the ages which preceded the Reformation in this country. This question the editor has treated with considerable fulness in the introduction, and with a discretion as sound as his learning. Even if evidence were previously lacking, the Mass-book which bears the name of Dan Jeremy leaves the fact absolutely certain that English laymen of the twelfth century did not understand the Latin of the missal service. It also proves that, while they were present at this service, they were occupied (with but one or two very brief interruptions) with devotions entirely distinct from those of the celebrant. The origin of this practice, and its extension until it seems fairly to have driven from the field the very theory of congregational worship, are further points of singular interest. The English Prayer-book in the Ordering of Priests, enjoins private devotion on the congregation; and Canon Simmons regards this as the survival of a practice of the early Christian Church which was destined to have most important consequences, as soon as the Roman Church determined that the Latin language should everywhere be the expression of the Latin ritual. The editor rightly speaks of the change to which this resolution inevitably led as "one of many examples where rigid adherence to one outward form has brought about a marked change in the original institution." He adds that when the Eucharist was first celebrated in Latin, it was beyond doubt "a congregational service in which the lay people took part in their own tongue." But the full significance of this fact is brought home to us only when we remember that a Latin liturgy anywhere, even in Rome, was the result of a change, which was only not a revolution because the theories which afterwards grew up in imperial Rome as the mother and mistress of all Churches had not yet taken shape. There are liturgists who contend that the Church of Rome and most of the Churches of the West were Greek religious colonies, with a Greek ritual and a Greek liturgy. In Dean Milman's belief this fact explains the assertion of Sozomen, that during the first centuries there was no public preaching in Rome; but, however this may have been, it seems quite clear that when the Latins became the majority among the faithful, the same principle which had thus far maintained the Greek liturgy where it was the speech of the first converts, substituted for it the liturgy in Latin as the language of the congregation generally. This precedent ought to have led to vernacular liturgies everywhere; but before Augustine had been despatched to England by Pope Gregory, the imperialism of the Latin Church had imparted a special sacredness to the Latin liturgy. But although Britain had been an imperial province, the English had never been subjects of Rome, and they were wholly ignorant of Latin. Hence in England, as Canon Simmons remarks, there probably never was "that answering the priest as with one voice, of which we read in countries where Latin, or what passed for Latin, had been the common tongue." The result was that in this country the practice of simultaneous independent devotions on the part of the priest and the congregation was vastly extended; and at length the theory that the presence of the laity during the Office was primarily and chiefly for the sake of private prayer was formulated with tolerable distinctness, and it was argued, as the editor remarks, in Queen Mary's time by temperate apologists for the Papal system, that, "instead of its being an advantage for Englishmen to understand the common service of the Church, it was a hindrance to their being occupied with their own prayers."

* *The Lay Folk's Mass Book; or, the Manner of Hearing Mass, in Four Texts; and Offices in English according to the Use of York, from Manuscripts of the Xth to the XVth Century.* By Thomas Frederick Simmons, M.A., Canon of York, Rector of Dalton Holme. 1879. Early English Text Society.

England in the Reign of King Henry the Eighth. Part I. Starkey's Life and Letters; with an Extract on Yeomen's Food, &c., in Edward VI.'s Time, from Sir William Forrest's Pleasant Poesye of Princelie Practise, 1548. Edited by Sidney J. Herrtage, B.A. Extra Series. 1878. Early English Text Society.

Original Glossaries, and Glossaries with Fresh Additions: a Dictionary of English Plant Names. By James Britten, F.L.S. (Department of Botany, British Museum), and Robert Holland. Part I. Series C. 1878. English Dialect Society.

Reprinted Glossaries, XVIII.—XXII. Edited by the Rev. Walter W. Skeat, M.A. Series B. 1879. English Dialect Society.

The English versions of Dan Jeremy's Mass-book prove that in the fifteenth century "the people were no longer required to answer aloud in the Church of England, if indeed any, except literates, had ever done so, except at the *Orate* in the offertory, possibly at the *Sanctus*, and in the *Paternoster* at the end of the Canon." Amongst other noteworthy facts, the texts of Dan Jeremy's book conclusively show how entirely the celebration of the Mass had become dissociated from the communion of the laity, not a word being said of the houselling or administration of the Sacrament.

The devotions provided in the Layman's Mass-book are practically a running commentary on the Office of the Mass; and it must be admitted that, as a whole, the commentary is excellent, being inspired with a religious spirit at once enlightened and sincere. The sentences treating of the prayer for charity at the Pax teach the reader that that virtue is threefold, consisting of love first of God, then of self, and lastly of our neighbour. That Dan Jeremy was a wise instructor may be seen from the following lines:—

> þo secunde is a priue loue,
> þat is nedeful to my behoue,
> þo whilk loue is propirly
> by-twix my soule and my body.
> þerfore make þou, gode lorde,
> my body & my soule of one a-corde,
> þat ayther part by one assent
> serue þe with gode entent.
> Let neuer my body do þat ille
> þat it may my soulle spille.
> þo third loue is withouten
> to loue ilk neghtbur me abouten
> and of that loue for noþing cese,
> þerfore I pray þe, prince of pese,
> þat þou will make, als þou may best,
> my hert to be in pese & rest
> & redy to loue alle maner of men.

Like the original of the *Gesta Romanorum*, the actual text of Jeremy has disappeared; but in his introduction the editor gives, we think, cogent reasons for his conclusion that it was written in Norman French; that Jeremy himself was a canon of Rouen Cathedral and also Archdeacon of Cleveland; that the book was after his death translated into the dialect of his archdeaconry, and that by means of alterations, carried out so far as they could be without "mis-metering" the poem, it was thrown into a midland form. That the original work was written not later than the middle of the twelfth century the editor regards as proved, amongst other evidence, by the fact that the manner in which the rubric speaks of the ringing of the bell at the elevation shows that the practice had not as yet become general. That the author was therefore the Jeremias who is mentioned as being at Rome with Thurstan, Archbishop of York, in 1123, seems now to be placed beyond doubt by the testimony of charters with which the editor became acquainted while he was writing his introduction. It follows that the author wrote for Normans in England who had not yet become Englishmen; but within a few generations the relations of England with the French kingdom had undergone the change which welded Normans and English into a single people, and Dan Jeremy's work was then as naturally clothed in an English dress as it had been put forth in a French one.

In addition to the Layman's Mass-book, this admirable volume contains five forms of the Bidding-prayer, noteworthy as the only vernacular portion of the Divine Offices of that age. The time of the first of these forms is fixed by the charge to pray "for the patriarch of Jerusalem, and specially for the holy cross, that God for his mercy bring it out of hethen men handes into cristen mens kepyng." These are followed by the York Hours of the Cross and by the York Order of Mass. The editor has rightly judged that the latter may be very acceptable to comparative liturgiologists from the extreme rarity of missals of the York Use and the silence of liturgiologists as to its peculiarities. Four years ago Mr. Maskell's *Ancient Liturgies* was, he adds, the only work in which the student could find the York Mass. It has now been edited for the Surtees Society by Dr. Henderson; but the present volume would have been unfortunately maimed if the editor had not included it with other books which are directly associated with the province of York. Notes and illustrations, rich in learning and interest, with a glossary and index, complete one of the most valuable publications of the Early English Text Society.

Of volumes illustrating England in the reign of Henry VIII. the extra series of the Society gives us, as the first part, Starkey's Life and Letters. The editor rightly speaks of him as a man who owed such importance as he had to the circumstance that he was employed by the King and Cromwell as an instrument for communicating with Pole. In this task he was not very successful; but his letters are not without their value on the two points of the Papal Supremacy and of the legality of the King's marriage with his brother's widow. Of Starkey himself little is known. He belonged, it seems, to a family of high standing in Cheshire. In 1522 he was chosen one of the Proctors for the University of Oxford on the recommendation of Wolsey; but it was not until 1535 that he was instructed to obtain the opinion of Reginald Pole on the treatise relating to the Royal Supremacy, lately put forth by Sampson, Dean of the King's Chapel. A favourable judgment coming from such a man as Pole would greatly strengthen the King in the attitude which he had assumed towards the Pope, and win him the support of many who were now waverers. Starkey accordingly wrote to Pole, expressing the King's wish for his return, and assuring him that the throwing off of the Roman yoke would not involve any change in the doctrine and discipline of the Church. Pole, however, could not be induced to promise anything more than a general consideration of the subject; and in his next letter Starkey had to apologize as best he could for the judicial murder or execution of some Charterhouse monks and others for the "superstitious blindness" which prevented them from "discerning the diversity betwixt the unity spiritual and the unity political." Pole's answer touched only on the political dangers which might arise from the course which the King had taken, and Starkey was instructed to tell him that he had not dealt with the real matter at issue, and that his opinions on the policy of the King's acts might be kept until they were asked for. Pole's rejoinder came in the form of a treatise "De Unione Ecclesiastica," which expressed his mind plainly enough, with reference not merely to doctrine and discipline, but to the King's manner of life. For sending the book he pleaded the strange excuse that, "finding certain leaves which contain the sharpest strictures on the King's character cut out, he suspected that they had been purloined by some of his enemies for the purpose of sending them to Henry and doing him injury, and he therefore determined to forward the book as it was to the King." The extreme astonishment of Starkey at this issue of the negotiations sufficiently proves that he honestly looked forward to success; but, although he warned Pole that nothing but retractation could purge him from the guilt of the blackest treachery, his indignation failed to maintain him in the favour of the King, who now urged that in preaching against the Papal Supremacy he had treated the Bishop of Rome with too great mildness. The sequel brings out the servility of Starkey's character. He wrote to Cromwell, telling him that "from his earnest study of Scripture he has conceived a contempt for the things of this world"; but his letter expressed also a nervous anxiety for the retention of the Royal favour and his own temporal advancement. His threats failed to deter Pole from accepting a Cardinal's hat; the King perhaps felt that his choice of a tool might have been more judicious; and perhaps it was well that Starkey was some months later taken from the world which he professed to despise. It is but just to him to add that, though he had little strength of character, he saw clearly the vast responsibility which lay on the King in the use of the wealth derived from the suppressed monasteries, and that he spoke out on this subject plainly and forcibly.

In the appendix to this volume Mr. Herrtage gives an extract from the "Pleasaunt Poesye of Princelie Practise," written "by the simple and unlearned Sir William Forrest, preiste." Not much can be said for it as a poem; but it is noteworthy as containing a suggestion for compulsory education, and the appointment of overseers, or School Board officers, for carrying it out:—

> At fowre yearis olde let suche too scoole bee sett. . . .
> Leste some perhaps at this myght thus obiecte,
> The poore man his childe cannot so prefer,
> bycawse hee hathe not substaunce in affecte
> for so longe season to fynde his scoler,
> as (for his scoolinge) too paye his Maister;
> to whiche I answere, it muste prouyded bee,
> in eauerye towne the Scoole too go free. . . .
> An Ouerseer, Controwler to bee calde,
> to see vnoccupied none to remayne.

At the same time he urges the need of a fourfold raising of labourers' wages, as the only remedy for the increasing depopulation of the kingdom.

From the English Dialect Society we have the first part of a carefully prepared "Dictionary of English Plant Names," containing the entries from A to F inclusive. It differs from Dr. Prior's volume on the "Popular Names of British Plants" by including not only the vernacular names hitherto unpublished, but also the names, now discarded, by which British plants are mentioned in the works of the older botanists. Of the reprinted Glossaries XVIII.—XXII. we need merely say, with Mr. Skeat, that "those who wish to work at dialects can only be thankful for the time and expense saved by such reprints." The glossaries here reprinted give all the dialectical words contained in no less than ten volumes, and belonging to the dialects of Wiltshire, East Anglia, and East Yorkshire.

LIFE AND WRITINGS OF BUCKLE.*

A LADY in one of George Eliot's novels had a method of reading religious biographies which may be applied with equal success to the lives of philosophers. Where she saw the words "sermon," "grace," "works," "outpourings," she skipped; and where her eye met such terms as "boots," "dropsy," "horses," and the like, she read on, and pleased a secular taste. In perusing Mr. Huth's Life of Mr. Buckle most readers will probably keep a sharp eye for "chess," "cigars," "books," "boys," and the like, while less excited about "intellectual laws," "progress," "civilizations," "Comte," and Mr. Buckle's philosophy generally. They may also skip with profit when they see the name of Mr. Glennie. This sage made Mr. Buckle's acquaintance in the East, travelled with him and his companions, the two young Huths, and wrote a work called *Pilgrim Memories*, which irritates Mr. Huth extremely. Mr. Glennie seems, if Mr. Huth is right, to have compiled a treatise not unlike what Johnson's "Life of Boswell" might have been. The author gives himself all the con-

* *Life and Writings of Henry Thomas Buckle.* By Alfred H. Huth. London: Sampson Low & Co. 1880.

versational victories, and obviously thinks Buckle rather a poor creature. Hence the wrath of Mr. Huth, which crackles fiercely in foot-notes, and finally explodes in a polemical appendix. We mean to say no more about Mr. Glennie, except that he is the gentleman who complicated the Eastern question by having a skirmish with Mr. Archibald Forbes in Servia, and acting as his own Special Correspondent. Probably he can take care of himself in this little affair with Mr. Alfred Huth.

This biography is chiefly interesting where it deals with Mr. Buckle less as a philosopher than as a man. It is not easy to say what is Mr. Buckle's precise standing as a philosopher. Twenty years ago, he was worshipped by "thinkers." People who were not thinkers considered Mr. Buckle at once too bold and too cold. We have become accustomed to far greater boldness, for Buckle was only held a little more audacious than the writers in *Essays and Reviews*. The doctrine of evolution has left him far behind, for his *History of Civilization* took no note of our great ancestor, Bathybius. As to Mr. Buckle's coldness, it was a statistical coldness. He found out that so many persons per annum posted unaddressed letters, and he drew depressing inferences. People were made to feel rather less important and self-determined than the pawns in Mr. Buckle's favourite game of chess. Thus the philosopher was rather dreaded than admired in the non-philosophical world. A. K. H. B. lifted up the heel against him, if we may use the expression:—

I have mildly vented my indignation; and I now, in a moral sense, extend my hand to Mr. Buckle. Had he come up that corkscrew stair an hour or two ago, I am not entirely certain that I might not have taken him by the collar and shaken him. And had I found him standing on a chair in the green behind the church, and indoctrinating my simple parishioners with his peculiar notions, I have an entire conviction that I should have forgotten my theoretical assent to the doctrine of religious toleration, and by a gentle hint to my sturdy friends procured him an invigorating bath in that gleaming river.—*Fraser's Magazine*, June, 1859.

We may be certain that many millions of people, "mostly" what Mr. Carlyle calls them, agreed with A. K. H. B. Mr. Huth's book, which seems to be written with rare sincerity, shows us the man as he was, not the philosopher as he was supposed to be.

Henry Buckle was born at Lee in Kent, on November 24, 182 though, for reasons of his own (vol. i. p. 156), he told a correspondent that he was born a year later. We can hardly suppose that he wished to make himself seem a year younger than he really was, and the matter is only worth notice as showing the difficulty of fixing dates in biography. Buckle's father was a City man (an ancestor had been Lord Mayor in 1593), and by both sides he was descended from North-country people. His father, a stout orthodox Churchman, died when Buckle was almost a boy; the death of his mother, his greatest friend, seems to have caused or aided the premature break-up of his own health. As a child, Buckle was extremely weak and nervous, and, properly speaking, he received no training at school or college. His wide knowledge was the result of an average of eight hours' daily study after he reached the age of eighteen. At seventeen he was anxious to marry one, and, shortly after, another of his cousins, and he challenged to deadly combat the successful wooer of one of these ladies. From the other he was separated by relations who had probably exaggerated objections to the marriage of near kinsfolk. This seems to have been a severe misfortune. Mr. Buckle's habits became those of a "fidgety" bachelor:—

He himself paid cash for everything he bought, and was careful to get discount. Once, indeed, when he had bought a new carpet from a man who had promised him discount for cash, and then asked for the whole sum, Buckle quietly returned the unpaid bill to his pocket, and told them to call for payment that day two years. At one time he used to go to the butcher himself to select his meat, and see his steaks cut. He said he had "cultivated" an attention to cookery, and, certainly, was a first-rate judge of good and bad, though a moderate eater. He only ate toast on Mondays, because on that day the bread was more than one day old; but his servant had to bring up the toasting-fork into the dining-room and make the toast as required. No woman, he said, could make tea until he had taught her; the great thing was to have it very hot, the cups, and even the spoons should be warmed. The tea was to stand a little longer when the tea caddy was rather full, to allow time for the leaves to unroll; but at the bottom of the caddy there were more broken leaves, and hence so much time need not be allowed.

He was too particular about his tea and other trifles in his daily life. His conversation was apt to degenerate into controversy, and he was over eager to reach the bottom of every topic. He was not penurious, but people who did not know him seem to have thought him stingy. Out of an income of 1,500*l.* a year he spent 300*l.* yearly on books. He had 22,000 books, yet no one could call him a *bibliophile*. What name can be given to a book collector who has his treasures bound in brown paper by his servant? Mr. Buckle's books were tools rather than idols or friends. Here is an anecdote about his prowess as a student:—

It was his habit to sit up late at night, reading, with a wet towel round his head; and on one of these occasions he was frightened for the first, and only time in his life. It was about two o'clock in the morning, and he had been reading for several hours wholly absorbed in his book. The room was dark but for the two candles which burned on the table before him. Suddenly he became aware of something on the opposite side of the table; and, looking up in that hesitating, doubtful way one does when absorbed in something else, he saw a figure all robed in white gazing full in his face. Before he had time to think he shrieked aloud, and thus woke the landlady whose somnambulic figure it was that had just frightened him.

This was his system of reading:—

For fourteen years he worked here unknown to the literary world; and, unfortunately, we have no record of his life until the year 1850, when his *History* was already partly written, beyond the few chess games which have been printed. That they were no idle years, we may infer from the *History* itself; but still more from the fact that he read nearly all the books he had—that is, about three volumes daily—besides writing in every important book an epitome of its contents, learning more languages, and practising style. He always read pencil in hand, and when he had finished the book, wrote out in ink from his pencil notes what he wished to remember. These, again, when they were notes on a book that he wished to "master," as he called it, he used to read frequently. Sometimes he read and re-read a book twice or thrice, though his memory was so excellent, and his industry in note-taking so great, that he had not to do this very often. His system in reading was not to follow the book, but the subject.

With Buckle's tastes and circumstances, with his love of books, and his powers of concentration and combination, it was perhaps inevitable that he should take to literature. With his ambition, too, and with his income, it was natural that he should avoid frittering away his time on reviews. But it seems to have been an accidental meeting with Mr. Hallam in 1841 that turned his attention to the history of the Middle Ages. On that vast topic he at first intended to write a vast work, which ultimately became *The History of Civilization in England*. Buckle's beginnings were singularly modest. He studied history in Lardner's *Cabinet Cyclopædia*, and "Hawkins's little book on Germany." This was by way of laying the foundation on which were based the labours of fifteen busy years. Buckle worked from eight to nine hours a day, and never walked less than seven miles each day. His walks were very often made in search of the houses of beggars, whose statements he liked to test before giving money to them in easy charity. His favourite amusement was chess, in which he really seems to have been a master. Captain Kennedy gives this description of Buckle as a chess-player:—

He excelled in pawn play, which he conducted with an ingenuity and deadly accuracy worthy of the renowned pawn general, Szen. He gave large odds, such as Rook and Knight, with wonderful skill and success, appearing to have a sort of intuitive knowledge of a strange opponent's chess idiosyncrasy, which enabled him precisely to gauge the kind of risks he might venture to run. The rendering of heavy odds, as every experienced chess-player knows, necessitates hazardous and unsound play on the part of the giver. These contests of his at odds were always full of interest and entertainment to lookers-on, and a gallery two or three deep often surrounded his board in the Strand Divan, where it was his "custom in the afternoon" to recreate himself with his favourite game. I have occasionally seen roars of laughter elicited from the spectators by the crestfallen aspect of some poor discomfited Rook-player, who, with much care and solicitude, having obtained, as he fondly believed, an impregnable position, had suddenly found his defences scattered like chaff, and himself accommodated with a mate, after the sacrifice, by his keen-witted opponent, of two or three pieces in succession. Whether winning or losing, Mr. Buckle was a courteous and pleasant adversary, and sat quietly before the board, smoking his cigar, and pursuing his game with inflexible steadiness.

Mr. Huth goes so far as to say that "certainly Buckle was in 1851 entitled to the championship, not only of all England, but of the whole world." The titles of his writings on chess occupy five or six pages in his bibliography.

No life could be much less eventful than that of Buckle. He read, annotated, wrote; walked, dined, played chess, and corresponded with Miss Shirreff. Many of his letters to this lady are published; they deal with the outskirts of philosophy, and are not very interesting. The first volume of his great book was published in 1857. It became celebrated at once. Mr. Mudie took no less than a hundred copies (an enormous number for a philosophical book, apparently) and Mr. Buckle had at once the blessing of being translated into Russian and reviewed in a hundred journals. "The only real judgment of my book," he wrote to his friend Mr. Capel, "is that in the *Saturday Review*." Unknown correspondents pestered him from all parts of the world; and one American young lady (vol. ii. p. 90) was almost as explicit as the maiden in *Excelsior*:—

"Oh, come," the maiden said, "and rest
That weary head upon my breast."

As to the Russians, they darted on Mr. Buckle's book as the most advanced thing out. "Mr. Mackenzie Wallace twice found the Russian translation of Buckle's History in peasants' huts." Four independent Russian translations of it were made and sold in a few years. Mr. Mackenzie Wallace rarely heard a serious conversation into which Mr. Buckle's name was not introduced. He vainly attempted to counteract the influence of Buckle; he failed, and the present anarchic condition of Russia may partly justify the indignation of A. K. H. B.

The death of Mr. Buckle's mother, and his controversy about Sir John Coleridge and Thomas Pooley, are the only important events between the publication of his book and the journey to the East which closed with his death in May 1862. As to the Pooley controversy, it is better not to rake up that old story. Pooley was a rustic who thought he could cure the potato disease with the ashes of burnt Bibles. He also scrabbled, like David, on the gates, and wrote things offensive to decent taste in public places. He was sentenced to twenty-one months' imprisonment by a judge who, Mr. Buckle thought, would have been better employed in refuting him. How can you refute the theory that burnt Bibles will cure the potato-rot? Hence many articles, pamphlets, and a confused controversy. Buckle's health was failing. He had intervals of confused consciousness, he used to faint, and at other times would forget where he was. By way of seeking change he accompanied some members of Mr. Huth's family to Egypt and Palestine. The boys with whom he travelled retained very affectionate memories of the philosopher. His ideas about education were simple and practical. He was fond of young people, and they became attached to him. Not a man of much humour, he unbent with boys, and displayed an amiable side of his character. In Egypt

and Palestine he thoroughly enjoyed the natural beauty and historical recollections of these countries. He collected antiquities with zeal, and discussed all topics with almost consuming eagerness. The record of his last days (he fell ill of typhoid fever on the way to Damascus) is embittered by the controversy with Mr. Glennie.

Except for that unlucky controversy, and a few misprints, Mr. Huth has done his part of these volumes well and thoroughly. He is an intense believer; he defends Buckle elaborately from all his assailants, from A. K. H. B. to M. Littré. But his philosophical explanations of Buckle's work affect us less than his picture of a kind heart and a large intellect cramped in a feeble body, and fettered by certain social oddities. One can hardly help feeling as if the moral side of Mr. Buckle's nature, as here revealed, might outlive a philosophy which was but a "moment" in a rapid intellectual process.

TWENTY YEARS IN THE WILD WEST.*

TWENTY Years in the Wild West is an attractive title, and Mrs. Houstoun had the materials for an attractive book. We cannot help thinking that she might have made a better use of them, though we gladly admit that in her little volume there is much that is interesting, instructive, or exciting. Her style, to begin with, is greatly against her, and a simple glance at her pages is sufficient to jar on sensitive nerves. Words are underscored and emphasized with that lack of discrimination and perception which characterizes the style of too many of one's lady correspondents; while, more often than not, it is the least significant word in the sentence that Mrs. Houstoun singles out for special attention. Paragraphs that are perversely involved are lavishly interspersed with parentheses; while elaborate paraphrases and far-fetched phrases and quotations are made to do duty for plain and straightforward language. A graver fault, though one which we should have been more inclined to forgive, is the absence of anything like method or arrangement. At the same time, as we have said, the book is an interesting one, and should be welcome as throwing light on the West of Ireland, at a time when "Irish discontent" is a daily heading in the newspapers. Mrs. Houstoun undoubtedly is well informed as to what she is writing about. In an evil hour it occurred to her husband, who seems to have been a retired soldier with considerable means, to speculate in stock-raising in the Wild West. Unhappily for himself, he went into the enterprise on an extensive scale, and tied himself by a long lease. He rented no less than ninety square miles of hill pasture and bog on the Galway coast, and betook himself to breeding sheep, cattle, and horses. Knowing little or nothing of the business, he had to begin by placing himself entirely in the hands of intelligent natives. We need not say that his undertaking proved a lamentable failure. But when the stakes laid down are so heavy, one is bound over to play out the game, and consequently "the Captain" and his wife drained the cup of their sorrows to the dregs.

We cannot be surprised that, under such circumstances, the lady should write bitterly; but her picture of the general state of things in Galway is as gloomy as that of the more immediate circle of her personal experiences. She denounces absenteeism, the priests, and over-population as the causes of the universal wretchedness, disaffection, and discontent. As for absenteeism, we are bound to say that the book is the most conclusive apology for it that we have ever read. If the "Wild West" is what she describes it, we cannot conceive any gentleman resigning himself to existence there if he has the means of scraping along in a cottage elsewhere. The lot even of a Roman Catholic landlord would be hard; but that of a Protestant must be simply intolerable. Then the malignant influence of the priest comes in; and Mrs. Houstoun represents the priest as the incarnation of truculent self-interest and fanatical intolerance. The old genial type of the reverend father who used to figure in the stories of Lever or Carleton is gone—the men, we mean, who, educated at St. Omer, had seen something of society in France; who could meet the squire or the Protestant rector on pleasant terms; who could sing a capital song, and keep the peace at a mixed supper-party. Mrs. Houstoun made the acquaintance of one of the last of the race at Westport, in the person of a jovial "Dane" O'Rourke. In place of those easy-going men of the world, who were none the worse soldiers of their Church because they met the heretics with chivalrous courtesy, you too commonly find a peasant-born bigot, bred and educated at home, whose first thought is to make a decent living by his calling. He must screw what he can out of poverty-stricken parishioners, who are ground to the dust by rackrents and usurers. He keeps them in slavish terror by the fear of what may befall them after death. Should they turn recalcitrant on any point, he refuses them "the sacraments," which is tantamount in their ideas to eternal perdition, and thereby very quickly brings them to reason. Naturally he detests the immigration of Protestants into his district, since the spread of their free-thinking opinions would be damaging to the dues by which he lives. It is his object to drive them out of the country, or even worse. And, if we may trust Mrs. Houstoun, the ordinary parish priest is absolutely unscrupulous as to his modes of proceeding. He does not hesitate to preach assassination from the altar. She relates two instances in particular, and in the former, as is so frequently the case among the Irish, there is comedy mingled with the tragic and terrible. The hero was a certain "Father Pat," at least as much given to conviviality as any of the jovial clergy of the earlier generation. He had been assisting at a "Station," had been taken ill during the night, and had sent an express in the morning to "the Captain's" residence, to intimate that he was "destroyed enthirely with a pain insoide of him." The Captain went off on the errand of benevolence to find, when he reached the bedside of the sufferer, that the only specific the patient would take was a "hair of the dog that had bitten him." Subsequently the interesting convalescent stopped at the lodge on his way home to lay in a fresh supply of medicine in the shape of a soda-water bottle filled with potheen:—

> Will it be believed that on the Sunday but one that followed on our Good Samaritan-like deed this Louisburg priest fulminated from the altar against us, and likewise caused to be published in the local Roman Catholic papers, the most bitter and the most inciting denunciations to murder. The Scotch adventurer was to be "smashed up"; his people and he, who were robbers of "the countryman's home," were to be destroyed entirely; and his "flocks and herds" were to be "got rid of," so that God's human creatures might have their rights again.

The second case occurred on the occasion of the well-known murder of James Hunter, who had for some years been the Captain's head bailiff. We believe, by the way, that the crime was perpetrated within a dozen miles of the spot where the life of Lord Sligo's agent was attempted a few months ago. Suspicion, amounting almost to conviction, had settled on a certain person. As everybody, however, had refused to give evidence, the Government sent down a force of police, to be supported at the expense of the townland till the assassin was handed over to justice. The pressure began to tell, and the innocent to murmur at having to suffer in their poverty for the guilt of another man, when the priest cut the murmuring short. "Now, boys, I'll have no quarrelling," was the significant warning he addressed to his flock; and it was implicitly obeyed by their silence.

The personal experiences of the Houstouns during their twenty years of exile were exciting and varied enough to gratify any reasonable enthusiasm for enterprise or adventure. They began, as we said, by employing native Hibernians on their enormous grazing farm, and found a treasure of a man to place at the head of their staff. The treasure robbed them right and left in the most barefaced manner, while he had always plausible explanations to account for his deplorable pecuniary deficiencies. He bought superannuated sheep and cattle, charging them with five times the prices he actually paid. Meantime, peasants who had immemorial rights of common confounded the Saxon's cattle with their own, and sold or slaughtered promiscuously and indifferently. The new comer was ruined, or nearly so, when he revolutionized his whole system and replaced his entire body of servants. He imported a trustworthy body of Scotch shepherds, placing the unfortunate James Hunter in charge. Then the grazing appears to have become more profitable, as might very well be the case; but causes of quarrel were multiplied with the Celts. The Scotchmen, though honest and loyal, in natural alarm for their lives or for their families, told far less than they knew of rascalities that were going forward. Nevertheless they were the objects of two separate attempts at intimidation, if not cold-blooded murder. Armed parties stole up to their cottages in the night and poured volleys into the rooms where the children were sleeping. In either instance, whether by intention or good luck, the shots were aimed a trifle high, and missed the sleeping infants by a few inches. These were followed by even a more deliberate attempt to murder the obnoxious master with his wife and servant. They were driving homewards in the dusk along a wild mountain road which had been much broken up by the winter floods. At one place, where it overhung an abyss and the slight parapet had given way, the English groom shouted a warning. The Captain just pulled up in time to save his spirited horses from starting at a low wall of loose stones which had been raised across the road since they passed that way in the morning. It was comparatively a trifle after this, that in revenge for some supposed cause of offence six valuable setters were found dead one morning from poisoned meal that had been thrust into their kennel.

Mrs. Houstoun represents the climate as detestable. Living within reach of some of the most glorious scenery in our islands, there was but one day in sixty when it was clear enough to enjoy the views; and through by far the greater portion of the year they were in perpetual rain, drip, or fog. Otherwise, and had their minds been more free from anxiety, there was a good deal that might have been picturesque and enjoyable in the life. There was fair wild shooting on the hills, and first-rate trout and salmon fishing in the loughs and the rivers. We have a spirited account of a pull in a six-oar boat to the mouth of the Killery Bay, and it is one of the best examples of Mrs. Houstoun's descriptive powers:—

> On both sides rise the mountains with their rugged faces heather-clothed, and with their steep sides ornamented at frequent intervals by rushing water-courses, narrow, silvery, ribbon-like lines, edged with ferns and rendered tortuous by huge masses of rock, from which jut self-sown hollies and dwarf oaks.

Now and again an otter would plunge from the cliffs into the water; or a seal, tame from impunity, would come swimming confidently towards the boat, to draw the fire of the

sportsmen. There is an exciting story, too, of the "harrying" an eagle's nest, when the old birds had worn out the patience of the sheep-farmers by their unscrupulous marauding among the lambs. The new comers had built a residence for themselves in the wildest part of the wilds, and what impressed Mrs. Houstoun most disagreeably at first was the utter absence of anything like landscape-gardening about the house. The bog and heather came up to the doors. So she went to considerable trouble and expense in laying out shrubberies and a flower garden. Some of her favourite plants and shrubs she never succeeded in acclimatizing; but, on the other hand, the rapid growth of those that suited the soil and the climate was wonderful. Laurels and rhododendrons, deodaras and araucarias all throve to perfection; there were hedges of fuschia ten feet in height; while many flowering plants that must be housed in England through the winter "formed by far the most remarkable feature in our grounds." But that solitary oasis of grace and beauty in an inhospitable wilderness peopled by savages excited to atrocities by fanatical priests did not suffice to comfort the soul of the exile. In turning her back upon Western Ireland, Mrs. Houstoun must have regretted twenty wasted years of her life; and the moral of her volume unquestionably is that her countrymen and countrywomen should take warning by her sufferings, and chime in with the cry of "Ireland for the Irish."

ASHWELL'S LIFE OF BISHOP WILBERFORCE.*

(Second Notice.)

DR. WILBERFORCE had been Bishop of Oxford for about two years when Lord John Russell, then Prime Minister, startled the Church and the country by selecting Dr. Hampden, Regius Professor of Divinity of Oxford, as Bishop of Hereford in succession to Dr. Musgrave translated to York. The consequent transactions were the crisis of Bishop Wilberforce's public life. He was at an early stage prominently mixed up with the affair, from his active interest, personal and official, in such questions; but, as it went on, he found himself directly responsible for some of its most momentous issues as diocesan of Dr. Hampden in virtue of the Rectory of Ewelme, then attached to the Divinity chair. Canon Ashwell clearly shows his appreciation of the importance of these few weeks by devoting just one hundred out of the five hundred and thirteen pages of his volume to the event, although he has missed the full value to Bishop Wilberforce and the whole Church of what was a present calamity from having constructed his narrative of the Bishop's previous career on a conventional basis. We shall, as far as we can, continue our estimate of the Hampden business to the Bishop of Oxford's own proceedings; still we must begin with a few words on Dr. Hampden himself. This divine first came into general prominence by preaching a course of Bampton Lectures in 1832, followed in 1834 by a pamphlet entitled *Observations on Religious Dissent*, both of them being works of so startling a character that when Lord Melbourne gave their author the Professorship in 1836, a movement in opposition was made at Oxford, which after sundry ups and downs resulted in Convocation passing a statute, which had been brought before it by the Heads of Houses (according to the then constitution of the University), by 474 to 94 votes—a large number in those præ-railroad days—declaring that, having no confidence in Dr. Hampden's mode of treating theological subjects, the University could not allow him to judge of the qualifications of the Select Preachers at St. Mary's. In 1842 advantage was taken of the formation of a new theological Board at Oxford, of which he was *ex officio* chairman, to move for a reversal of the censure. This was, however, rejected by 334 to 219. It was more than bold in Lord John Russell, with all the clergy of England to pick from, and just after the shock of Mr. Newman's secession, to select Dr. Hampden for the see of Hereford, although, in his own characteristic way of throwing insults at his opponents in phrases of sanctimonious magnanimity, he could plead that by withdrawing the recommendation sanctioned by the Queen,

> I should virtually assent to the doctrine that a decree of the University of Oxford is a perpetual ban of exclusion against a clergyman of eminent learning and irreproachable life; and that, in fact, the supremacy which is now by law vested in the Crown is to be transferred to a majority of the members of one of our Universities. . . . . I cannot sacrifice the reputation of Dr. Hampden, the rights of the Crown, and what I believe to be the true interests of the Church, to a feeling which I believe to be founded on misapprehension and fomented by prejudice.

The offensiveness of the selection cannot be better put than it was by one whose own theology combined a large inheritance of the old Low Church school with opinions which made him a distinguished forerunner of the coming Broad Church party, and who, as a Cambridge man, would judge dispassionately of proceedings at Oxford. Archdeacon Hare condemned the appointment as

> a most injudicious measure on the part of the Minister by whom he was appointed; as a wanton outrage on the feelings—prejudices they might be, but still strong and earnest feelings—of a large body of the Church, especially of the clergy; as an act which would infallibly arouse vehement opposition, and break up the peace of the Church at a time when we were hoping for something like a lull after the storms of late years. . . . On these grounds I would have implored the Minister on my knees, if it would have been of any avail, to recall what seemed to me an act of folly almost amounting to madness, of which I have never been able to learn the slightest explanation or defence.

The Bishop of Oxford seems to have been stirred to active opposition by Bishop Phillpotts in a letter of November 18, 1847, three days after the appointment had been made public, in which the writer, with characteristic ability, while in form apologizing for so writing, puts aside any plea for inaction which could be urged by his correspondent on account of his position at Court and the presumed opinions of exalted persons, and then continues:—

> Perhaps it is as well that I delayed, for I am now able to say that the only two of my brethren from whom I have heard warmly concur in the necessity or fitness of adopting some measure, and approve of the particular measure which I had suggested, of our addressing the Archbishop, praying his Grace to lay before Her Majesty our humble and most dutiful hope that she will not recommend for election to the office of Bishop a Professor in the University of Oxford who is now under the censure of that University for holding and maintaining unsound doctrines, which he has refused to retract.
>
> One of the two Bishops who have written to me is a Cambridge man, and he expresses an opinion (while he has no hesitation in concurring in the measure) that Oxford Bishops ought especially to move in the affair and be more prominent in setting it forwards.

The address went on, but in the shape of one to be submitted to Lord John Russell, and was signed by thirteen out of the then Bishops, Archbishop Howley, who did not sign, having, as he himself declared, personally made a strong protest—although Lord John asserted that he had received no discouragement from him—and Bishop Longley of Ripon preferring to write separately. It pressed the impolicy of nominating to the Episcopate one "in the soundness of whose doctrine the University of Oxford has affirmed, by a solemn decree, its want of confidence." The Bishop who worked it as secretary was a Cambridge man, in whom caution generally rose to timidity, Kaye of Lincoln. We have already quoted the Minister's reply. Bishop Wilberforce was very zealous in pushing it as one of the Bench of Bishops; while there is no indication that at the time he, or any other person, attached any importance to the fact that he was Diocesan of Dr. Hampden in virtue of the Rectory of Ewelme, which brought him in relation with the otherwise extra-diocesan Regius Professor of Divinity.

On December 4, however, Mr. Charles Marriott, a distinguished High Church Fellow of Oriel, wrote to the Bishop, stating that theological articles had been drawn up—namely, by a small Committee of Oxford divines—impugning Dr. Hampden, and asked the Diocesan to sign Articles of Request which would transfer the suit to the Arches Court under the Church Discipline Act, giving as his reason that, if this were done, the opposition to the Confirmation at Bow Church would be less likely to be set summarily aside. The Bishop announced by return of post that in his judgment it would not be right for him to "*promote*" any such suit, but that if one were begun in his Consistory Court, he would at once transmit it by Letters of Request to the Court of Arches; and a week later he wrote to a clergyman of his diocese that he thought it "most desirable" that there should be "a formal trial of Dr. Hampden," "expecting," as he himself did, that the Government itself would announce such a trial. On the previous day (December 11) he himself had written to the Prime Minister, suggesting that Dr. Hampden should personally solicit a trial of his orthodoxy; and, strange to say, the Bishop seemed to have been astonished at Lord John's declining the advice. On December 16 he signed the Letters of Request, being advised—as we read with some amusement, remembering the position in which his own successor at Oxford is now standing—that if he refused, he might be compelled by a mandamus from the Queen's Bench. At the same time he wrote privately to Dr. Hampden, "This ministerial act I have not felt at liberty to refuse to perform. It pronounces no opinion of the truth or falsehood of the charges brought against you." On the very next day, anxious to prevent litigation, he wrote again to the Professor, in the first place formulating eleven heads of Christian Belief, which his writings seemed to have contradicted, and of which the Bishop called upon him to "avow his unhesitating reception," and in the second place, "for the peace of the Church, and in deference to the expressed opinion of your Bishop and others to withdraw the 'Bampton Lectures' and the 'Observations on Dissent,'" without thereby "admitting" any unsoundness in them. He accompanied this letter by an explanatory one to Lord John Russell. Dr. Hampden answered by return of post. Had the questions been put by any one but his diocesan, he would have been justified in considering them an "insult," but he acknowledges the Bishop's "kindly spirit."

> On this ground, therefore, and in perfect respect to you as the Bishop of the diocese, and for your personal satisfaction, I unhesitatingly reply in the affirmative. I say "yes" to all your queries on my belief—in that sense in which they are the plain natural sense of the statements of our Articles and Formularies.

At the same time he ignored the suggestion of withdrawing his books. Canon Ashwell says, "This letter was another disappointment to Bishop Wilberforce." We cannot understand why it should have been so. The Bishop, it must be assumed, was well advised when he drafted and put his questions; but it is not clear why a universal "yes" in reply, covering them all, could have been a disappointment. No answer could be more complete in terms; while it is a first principle of justice that a man on his trial, as Dr. Hampden virtually was, should not be bound to amplify his answers at the pleasure of his inquirer; besides it was very sanguine to expect a man who respected himself to leave it open to have it said of him that he ran away from a prosecution

* *Life of the Right Reverend Samuel Wilberforce, D.D., Lord Bishop of Oxford, and afterwards of Winchester.* By A. R. Ashwell, M.A., late Canon of Chichester. Vol. I. London: John Murray. 1880.

and up to a mitre by suppressing books on the understanding that he was not admitting their unsoundness. Plainly the Bishop, by this impulsive, generous, and pacificatory, but impolitic step, gave Dr. Hampden an advantage, of which it is fair to say that he availed himself in language of unimpeachable courtesy. In a few days more the Bishop learned from Dr. Hawkins, then and still Provost of Oriel, that Dr. Hampden had informed him that the "Observations on Religious Dissent" were being sold "against his wish." This fact seemed to the Bishop to change the whole aspect of the case, as the "Observations" would be no longer pleadable, and a suit against the Bampton Lectures alone would, he thought, be no longer sustainable. Besides, he now believed himself to possess a power of option as to signing Letters of Request which he had not previously admitted, so that he considered his signing would more or less implicate him in an opinion on the merits of the case; the result of all which was that, as he wrote to the Provost of Oriel on December 24, "I have withdrawn from the promoters the Letters of Request." The fact was, though it does not so appear in the book, that the Letters which he had at first signed proved to be irregular, and would have had to be signed *de novo*. No doubt the Bishop found himself in a dilemma, and if he had never signed any Letters of Request, he would have had the case before him in its then condition on which to decide whether he would do so for the first time. On the other hand, his opinion of the "wanton outrage," as Archdeacon Hare called it, remaining unchanged, and the objection to Dr. Hampden being in its nature quite independent of any explanation, however plausible, which skilled dialecticians could offer of the real scope of those at best most risky writings, Bishop Wilberforce's more wise and courageous course would have been to have treated his given assent as now beyond his own control; and, after duly warning the promoters of the defeat which he believed imminent for them, to have continued, at their request and on their responsibility, his signature. His so doing would have procured for Dr. Hampden the trial which he had declared desirable in the interest of the impugned Professor's own good name. The trial might, as the Bishop anticipated, have broken down; but this would have at least smoothed the way to the reception of Dr. Hampden into the ranks of an order from which he could no longer be excluded; and when the evils of the original scheme were shown to be inevitable, sound policy would have dictated its being minimized in practice. This could only be reached through some competent decision. It was the Bishop of Oxford's mistake to imagine that his personal conclusions would be accepted as such decision, and so, in his very eagerness to be impartial, he constituted himself the volunteer judge of an unheard controversy.

Unluckily, Bishop Wilberforce added, as a cumulative reason for his change of policy, that he had hitherto been acting on a knowledge of the Bampton Lectures derived from extracts prepared by Mr. Newman in 1836, which, on a very recent study of the book itself, he repudiated in terms which we do not care to quote. Persons in critical periods must often take their sides on convictions derived from extracts set out by competent authorities. The rank and file of a party can hardly do otherwise. Politics would be at a deadlock if every voter were bound to suspend his judgment till he had mastered the speeches of Lord Beaconsfield and Mr. Gladstone. But there is one law for rank and file and another for commanders. For a man of Bishop Wilberforce's exceptional quickness it would have been the easiest and shortest, no less than the most obvious, measure of precaution, on hearing from the Bishop of Exeter, to run through a single octavo volume. The *naïveté* with which he confessed his neglect sufficiently proves his sincerity, but his having done so most seriously abated from the judicial weight of his words and acts in the eyes of the most impartial bystanders, and placed a legitimate controversial weapon in the hands of all the supporters of Dr. Hampden. The most inexplicable thing in the affair is, that neither he, nor, as it seems, Canon Ashwell, seems in any way to have appreciated the gravity of the blunder. The question between the Bishop and the Hampdenites, by his own showing, was not whether he deserved their thanks for dropping proceedings as soon as he believed that he had been misled by relying on extracts, but whether they deserved an apology from him for his acts under a misapprehension so easy to have been avoided. We have nothing more to do with the subsequent fortunes of the case, as at this stage the Bishop of Oxford dropped out of it. Most churchmen will, we believe, adopt the regretful estimate of his action which is contained in a letter of Bishop Phillpotts of January 1848, published with exemplary fairness by Canon Ashwell. His very mistakes show that the Bishop of Oxford was perfectly sincere all through the affair, and everything confirms his assertion that he had not changed his own opinion upon the offence of making Dr. Hampden a Bishop. But it is quite clear on the evidence of his own letters that he mismanaged it from the attempt to fulfil simultaneously, or by instantaneous transition, the incongruous parts of partisan, administrator, judge, and mediator, while the knowledge of character so generally attributed to him seems to have been singularly at fault. With a man of his temperament, to feel that he had mismanaged a great case, and misread the characters with which he was dealing, must have been singularly painful.

The practical conclusion of the whole affair as it personally affected Bishop Wilberforce may be briefly summed up in his own words by the following passage in an extract from his diary on the fourth anniversary of his consecration (November 30, 1849), quoted by his biographer in the earlier part of the book, among other evidence of his abiding sorrow for his wife, in sight, so to speak, of whose grave it was written:—

Turns of this year . . . . (*c*) Evident withdrawal of Royal favour; G. E. A. [nson]'s death bearing on this. . . . Keep me from even *seeming* double. Make my righteousness of purpose. Teach me to submit when (as in 1847) I am falsely charged with want of simplicity. I. [*i.e. in re* Hampden.]

How far it was judicious to publish this is not our business. The Bishop himself was conscious of the loss of Royal favour, and he connected it with the Hampden affair, while those who are responsible for the book have divulged the fact. He became, we believe, not only a more happy, but a far greater man, owing to the wrench. In the divine ordering of the world the personal religion of rulers must, however indirectly, have its great definite value; so the office of Royal Chaplain is, as a public function, neither despicable nor unimportant. But to the man who fills it with the zest with which Bishop Wilberforce frankly owns that he did, it is not only fascinating, but engrossing. The real great work of his after life, the conception and exhibition of the typical, organizing, executive Bishop of the Church of England would have been impossible from the distraction of thought and pre-occupation of time which his duties must have exacted from an equally typical Court Chaplain. To a sensitive nature such as that of Samuel Wilberforce the wound was peculiarly severe, but in proportion salutary. Of his work as Bishop a very interesting record is seasonably given—although it would more strictly have belonged to a later volume—in a letter from the present Bishop of Ely, Dr. Woodford, minutely and picturesquely portraying the spirit and details of his ordinations, from the writer's own experience "as one of the Examining Chaplains during the long period of sixteen years"—that is, beginning eight years later than the volume closes. In the facts which it portrays it fully justifies the opinion of "one of the senior clergy of the diocese of Oxford, that the most telling part of the late Bishop's work was to be found in his Confirmations and Ordinations." The two concluding words of the last Ordination Charge which Dr. Wilberforce, as Bishop of Winchester, ever delivered were "Work—Pray."

There is a peculiarly sensible letter of September 4, 1846, from him to a friend at Oxford who was disturbed by some busybodies who were shocked at hearing that the Bishop sat by on Sunday evenings while Prince Albert played chess. Prince Albert, as the Bishop explains,

has been accustomed to regard Sunday as it was regarded, I believe, all over Christendom, until the English Puritans altered the English feeling—not as "the Sabbath," but as the great Christian Feast of the Lord's Resurrection, much as we keep Christmas Day.

However, the Prince felt that the more strict way of observing the day .

is now associated with all our religious feelings. He would on no account violate the religious feelings of others. Consequently *cards* are always banished on Sundays, but very often he plays at a round German game of four at chess, with three gentlemen present. *I* never play, because I explained that, whilst I could not say that I thought the *act* wrong, yet I thought it would be highly inexpedient in me to have it said that a clergyman played.

On the whole question the Bishop sums up thus:—

But I do not think the *act* wrong, or the Sunday to be kept as a Sabbath. I believe we as a nation gain much on the one side and lose much on the other by our utterly untrue notions as to Sunday. I believe many are led to spend the day better—here is the good—than they would if they saw games, &c., encouraged after afternoon church. But I believe that the *untruth* of teaching people to believe that a Sabbatical abstinence is our duty does far more harm, leading many to violate their consciences, giving rules which cannot be kept, making it impossible to distinguish between a sinful disregard of the Lord's Day and that use of it as a day of rest and gaiety which it is meant to be, specially for the poor and the confined, and so that multitudes, who under a sounder teaching would come to church and give hours to devotion, &c., and then take their children into the country for a Sunday evening, are led to regard themselves, because they do this, as Sabbath-breakers, and so to throw away all observation of a day the due observation of which they have been accustomed to regard as what they find to be impossible. These were my dear father's views about Sunday, its spiritual character—the entering into that spiritual character being signally blessed to any one, and a mark of growing spirituality, &c.—but the non-*Sabbatical* character of it.

I believe that to proclaim these views would do harm, because the mass of the religious people of the land are so pervaded with other views that it would be really to encourage the irreligious to promulge them.

The fact that the writer was able to claim his father, William Wilberforce, as an advocate for the anti-Sabbatarian view of Sunday merits particular attention. What he says upon the danger of crudely bringing forward a novel view of such a question before people, when much of popular practical religion turns upon another theory, is wise and charitable. We only wish that this train of thought had occurred to him when he worked himself up into such a fury against Mr. Isaac Williams's "Reserve in Communicating Religious Knowledge."

The next biographer must early in his work deal with what was, to a man of the Bishop's affectionate nature and strong opinions respecting Romanism, a trial of exceptional bitterness—the secession to the Church of Rome of so many persons most closely and intimately related to him. There were his only and deeply-loved daughter, with her husband, all his three brothers—the eldest and only layman, William, a man of much erratic talent; Archdeacon Robert, master of a store of learning to which the more eloquent Bishop could lay no claim; and Henry, the counterpart of Samuel in attractive brilliancy; both his wife's surviving sisters—Mrs. Henry Wilberforce and Mrs. Ryder, with her husband—as well as the distinguished widower of the fourth of the Miss Sargents, Archdeacon

Manning. Many men with the training and the earlier career of the Bishop of Oxford would by this have been driven back into suspicious and soured Puritanism. With him the trial brought out all the greater elements of his character. It was henceforward not by condemnations, or deprivations, or petty opposition to eminent theologians seeking literary honours, that Bishop Wilberforce resisted the allurements of Rome; but by acting out the historical Church of England in its completeness. Whoever takes up the pen must have the perspicuity of mind and style to distinguish between the earlier and the later Wilberforce. It would be unjust to him and to Canon Ashwell to insist on the later biography being a mere continuation of the first volume. That has already given us in sufficient completeness one able man's estimate of the Bishop's character, and now we want to have another from another hand.

The volume is not quite free from oversights. R. H. Froude was a Fellow of Oriel, and not, as stated in page 35, of Exeter. The Bishops whose Address elicited William IV.'s famous declaration of care for the Church were those of England, and not, as said in page 77, of Ireland. Neither, as given in page 322, did "Mr. Gladstone become for the first time a Cabinet Minister" when he was made the Colonial Secretary of Sir Robert Peel's re-constituted and now Free-trade Ministry in December 1845. When Sir Robert first came in in 1841 Mr. Gladstone received the now abolished post of Vice-President of the Board of Trade, to which was added the Mastership of the Mint, both these offices carrying with them a Privy Councillorship, but not a seat in the Cabinet. In due time, however, he became President of the Board of Trade, and then entered the Cabinet; but subsequently retired from office, in February, 1845, owing to a conscientious scruple lest his support of the Maynooth Endowment, coupled with the foundation of the Queen's Colleges—both of them inconsistent with the central principles of his book on the Church in relation to the State—should have been attributed to self-interest and greed of place.

STEDMAN'S LYRICS AND IDYLS.*

THIS is a collected edition of poems which have appeared in America at various times since 1860, but they will probably be new to most English readers. Mr. Stedman's command of the resources of English verse entitles him to a high place among the minor poets of our time. His work neither shows original powers of the first rank nor puts forward any claims which would require such powers to make them good; but on its own ground it is generally excellent. An extensive mastery of poetical ideas and language and great skill in versification are guided by a refined taste which is seldom found wanting. Mr. Stedman has made his mark as a careful and judicious critic of modern poetry; and, when he comes to write poetry himself, his critical faculty stands him in good stead by enabling him to make the best of his materials. He does not attempt to disguise the influences which have formed his work. Some of the pieces classed as idyls are nothing else than deliberate and explicit studies in the school of Mr. Tennyson. Take, for example, these lines from "The Freshet":—

I fell in, there,
With Gilbert Ripley, once my chum at Yale.
Poor Gilbert groaned along a double year,—
Read, spoke, boxed, fenced, rowed, trod the football ground,—
Loving the college library more than Greek,
His meerschaum most of all. But when we came
Together, gathered from the breathing-time
They give the fellows while the dog-days last,
He found the harness chafe; then grew morose,
And kicked above the traces, going home
Hardly a Junior, but a sounder man,
In mind and body, than a host who win
Your baccalaureate honours. There he stayed,
Half tired of bookmen, on his father's farm,
And gladly felt the plough-helve. In a year
The old man gave his blessing to the son,
And left his life, as 'twere his harvest-field,
When work was over. Gilbert hugged the farm,
Now made his own, besides a pretty sum
In good State Sixes ; partly worked the land,
With separate theories for every field,
And partly led the student life of old,
Mouthing his Shakespeare's ballads to himself
Among the meadow-mows; or, when he read
In the evening, found a picture of his bull,
Just brought from Devon, sleek as silk, loom in
Before his vision. Thus he weighed his tastes,
Each against each, in happiest equipoise.
The neighbour farmers seeing he had thrift
That would not run to waste, and pardoning all
Beyond their understanding, wished him well.

Yet the following of the master has nothing feeble or servile in it; and in another poem Mr. Stedman has attempted, with creditable success, the very difficult task of furnishing a pendant to one of Mr. Tennyson's best-known minor pieces. In Penelope we have the reply, not exactly to Ulysses's resolve as expressed by Mr. Tennyson, which is a pure soliloquy, but to some supposed communication of it to his wife. The sentiment is un-Homeric; but this can hardly be avoided in any modern poem on a Homeric subject. The Tennysonian ring is hardly less marked than in Mr. Stedman's idyllic manner, but the work is good enough to justify itself. We cite the conclusion of the poem:—

Yet if thou wilt,—in these thy golden years,
Safe-housed in royalty, like a god revered
By all the people,—if thou yearnest yet
Once more to dare the deep and Neptune's hate,
I will not linger in a widowed age;
I will not lose Ulysses, hardly found
After long vigils; but will cleave about
Thy neck, with more than woman's prayers and tears,
Until thou take me with thee. As I left
My sire, I leave my son, to follow where
Ulysses goeth, dearer for the strength
Of that great heart which ever drives him on
To large experience of newer toils!

Trust me, I will not any hindrance prove,
But, like Athenè's helm, a guiding star,
A glory and a comfort! Oh, be sure
My heart shall take its lesson from thine own!
My voice shall cheer the mariners at their oars
In the night watches; it shall warble songs,
Whose music shall o'erpower the luring airs
Of Nereïd or Siren. If we find
Those isles thou namest, where the golden fount
Gives youth to all who taste it, we will drink
Deep draughts, until the furrows leave thy brow,
And I shall walk in beauty, as when first
I saw thee from afar in Sparta's groves.
But if Charybdis seize our keel, or swift
Black currents bear us down the noisome wave
That leads to Hades, till the vessel sink
In Stygian waters, none the less our souls
Shall gain the farther shore, and, hand in hand,
Walk from the strand across Elysian fields,
'Mong happy thronging shades, that point and say:
"There go the great Ulysses, loved of gods,
And she, his wife, most faithful unto death!"

In ballads and minor poems Mr. Stedman shows more of his own individual tastes and powers. He can be strong and direct in telling a grave story, and subtle and light in the half-serious manner attempted by many writers and achieved by few. The only drawback to our enjoyment of "Peter Stuyvesant's New-Year's Call" is a minute linguistic slip, which we should have thought Mr. Stedman too careful a scholar to commit. He makes Dutchmen say "Myn *Gott*," which no Low Dutchman could possibly do unless his speech had got sadly mixed up with High German communications. Neither is "vrouw*lein*" a Dutch word; and, moreover, the proper diminutive of *vrouw* is not equivalent in meaning to the High German *Fräulein*. In several of the poems there is a tendency to revive picturesque old words, which is rather a pleasing feature. "Scathed and *scrawny* mates" for a group of weather-beaten trees is good. Mr. Stedman's observations seem seldom to fail him when he is dealing with scenes he knows; in Europe he does not always hit off the right epithet. It is really adding insult to the injuries of tourists to class Mont Blanc, the most grievously tourist-ridden of all mountains of respectable height, among "ancient summits lone." Even less is Mont Blanc a "lone summit" with regard to its natural configuration. There are mountains which stand out abruptly from the chain to which they belong, and may fairly be called solitary. But such is not Mont Blanc. He is *primus inter pares*, a monarch among a goodly company of surrounding aiguilles, most of which are indeed more worshipful than himself as far as difficulty of access goes. But very few poets have taken the trouble to be accurate about the Alps, and we can hardly expect Mr. Stedman to begin.

In one piece, "The Skull in the Gold Drift," there is an awkward conflict between science and poetry. The skull turned up from the "crystal sands, the drift of Time's despair," is addressed by the poet as follows:—

How seemed this globe of ours when thou didst scan it?
When in its lusty youth, there sprang to birth
All that hath life, unnurtured, and the planet
Was paradise, the true Saturnian earth!
Far toward the poles was stretched the happy garden;
Earth kept it fair by warmth from her own breast;
Toil had not come to dwarf her sons and harden;
No crime (there was no want) perturbed their rest.

Not only is this in flat contradiction to the history of the earth as conceived by modern science (which of itself might not be material), but the contradiction is made glaring by the use of terms and images suggested by geology in the preceding and following stanzas. The supposition of a golden age of highly developed life anterior to all the known geological epochs, and destroyed in a grand convulsion, is too unscientific to be conveniently used by a writer who almost in the same breath confesses to a knowledge of strata, the crust of the earth, and prehistoric animals. It is hardly needful to add in set terms that we have every reason to think of the earliest ages of man on the earth as anything but golden. If he wanted little but his food, he often and long together went in want of that; his rest was much apt to be perturbed by real wild beasts and (after imagination had been cultivated up to a certain point) imagined ghosts; and, if it was not perturbed by crime, it was because there can be no crime where there is no law.

The ode on "The Death of Bryant" is a finished and graceful work of commemorative poetry; the relation to *Lycidas* is transparent; but here again, as with the following of Mr. Tennyson in the idyls, the reproach of servility is avoided. The songs

* *Lyrics and Idylls; with other Poems.* By Edmund Clarence Stedman. London: C. Kegan Paul & Co. 1879.

which follow hard upon this in the present collection are among Mr. Stedman's most successful efforts. There is life in all of them, and a certain continuity of movement which is essential to a good song. They read as if they would really go with music; and composers on the look-out for something better than the insipid stuff on which the art of song-writing is for the most part exercised might do well to try one of these. The "Autumn Song" looks particularly capable of an effective setting; but as we are concerned here with literary merit in the first instance, we select "The Wedding Day":—

I.

Sweetheart, name the day for me
When we two shall wedded be:
Make it ere another moon,
While the meadows are in tune
And the trees are blossoming
And the robins mate and sing.
Whisper, love, and name a day
In this merry month of May.

No, no, no,
You shall not escape me so!
Love will not for ever wait;
Roses fade when gathered late.

II.

Fie, for shame, Sir Malcontent!
How can time be better spent
Than in wooing? I would wed
When the clover blossoms red,
When the air is full of bliss
And the sunshine like a kiss.
If you're good, I'll grant a boon:
You shall have me, Sir, in June.

Nay, nay, nay,
Girls for once should have their way!
If you love me, wait till June;
Rosebuds wither, picked too soon.

As almost all verse-writers do at one time or another, Mr. Stedman has tried his hand on the sonnet, in some respects the most difficult of all established forms of verse to handle with success. The best he gives is inscribed "To Bayard Taylor, with a copy of the Iliad":—

Bayard, awaken not this music strong,
While round thy home the indolent sweet breeze
Floats lightly as the summer breath of seas
O'er which Ulysses heard the Sirens' song.
Dreams of low-lying isles to June belong,
And Circe holds us in her haunts of ease.
But later, when these high ancestral trees
Are sere, and such melodious languors wrong
The reddening strength of the autumnal year,
Yield to heroic words thy ear and eye;—
Intent on these broad pages thou shalt hear
The trumpets' blare, the Argive battle-cry,
And see Achilles hurl his hurtling spear,
And mark the Trojan arrows make reply!

This passes with credit most of the tests proper to be applied to a sonnet. It contains a pointed, graceful, and continuous development of a single theme; the matter is neither too much nor too little. In one point of form it is not strictly orthodox; the Italian school demands a pause in the sense at the end of the eighth line, where the system of quatrains ends and the tercets begin. Here, on the contrary, the eighth line ends in an active verb on which the whole of the ninth line depends. But no English sonnetteer, except perhaps Milton, has ever bound himself in all respects to the strict Italian rules. Even Mr. Rossetti, with his wealth of technical resources, now and then allows himself licenses in rhymes and otherwise. Mr. Stedman is therefore well within his right. Yet we should incline ourselves (if the authority of English poets had not concluded the question) to hold that, inasmuch as the sonnet is in any case an artificial exercise of poetical skill, the rules of the art should be strictly followed. The poet's triumph in the sonnet—as in the many artificial forms of verse among which the sonnet alone has remained in common use—is to show what ease and variety are consistent with the observance of a fixed set of rules. At whatever point the rules are relaxed, the interest of the game is to that extent destroyed. We do not say that a poem of fourteen lines which satisfies the greater part or some, but not all, of the conditions of a sonnet may not be a very beautiful poem. In fact, there are many such (apart from the Shakspearian sonnet, which is a distinct species) to which it would be mere pedantry to refuse the highest admiration. But we think it is to be regretted that they are included in one name with sonnets which are formally perfect. In the old Chancery practice there was a supersubtle distinction between a "bill of review" and a "bill in the nature of a bill of review." We should like to establish a separate class of fourteen-line poems in the nature of sonnets. Perhaps, however, it is going rather far to expect many English readers to be so much as distinctly aware that a sonnet is confined to any particular number of lines.

At the end of the volume there are some translated pieces. The song sung by Jean Prouvaire in *Les Misérables* while awaiting the attack on the barricade is rendered with no small spirit and felicity. Successful translations from French poetry into English are so few that, when one occurs, it deserves special mention. The two next versions are from Theocritus and the Odyssey, and are in English hexameters. If English hexameters were a necessary evil, Mr. Stedman's would be as tolerable as most; but we do not think they are necessary. We prefer of the two the lines from Theocritus, where an attempt is made to give a true spondaic effect in the last foot by combination of monosyllables; for example:—

All which himself had learned, and great and renowned in song grown,

or by the use of such double words as *ploughshare, heartstrings.* At least these effects seem too frequent in a piece of moderate length to be accidental. But we seem to remember some blank verse from Theocritus in an earlier work of Mr. Stedman's, and wish he could give us some more such instead of hexameters. Last we have scenes from the much-translated *Agamemnon*, being the parts which immediately lead up to and follow the murder of the king. The translation is respectable, but wanting in fire and freedom; and we can hardly think it up to the mark of Mr. Stedman's best work. It looks as if it might have been made for some special purpose, to illustrate a lecture or what not, and then thrown in to take its chance with the rest. We have not yet mentioned the military and quasi-military ballads in this book, which, though few, form a class apart, and show that the writer's habitual refinement does not interfere with dash and broad effects in their place. It may perhaps be a fair conjecture that the moral and intellectual tonic of the War of Secession is only beginning to tell on American literature.

MAGNUM BONUM.*

THE first word of the title of this book we are much more disposed to admit as a fair description of the story than the last. It is indeed a great, at all events a long, story. But as to its being also good, that we cannot readily allow. We are too fresh from reading it willingly to concede that it has much merit. It is many a day since we have had an equal struggle to wade through three volumes. We have, indeed, at length reached dry land, but we feel as if we had left our wits behind us. It is not often that we are baffled by a novel. We have learnt the art of sitting down to its three volumes doggedly, and going through them with steady patience at one or two sittings. But *Magnum Bonum* has almost been too much for us. We began it a fortnight ago, but soon laid it down in despair. We took it up again, but again broke down. We tried it at different hours of the day—before a good dinner and after a good dinner. We tried it when we were sleepless, and we tried it when we were drowsy. We tried it over a cup of tea, and again over a pipe. But we could make nothing of it. We left it on the drawing-room table to see whether any one else could read it. We noticed that at least one young lady went through it with apparent interest. We came to the conclusion that, like embroidery, stocking-darning, crewel-work, gossip, and curate-worship, it is adapted only for the fair sex. It is no doubt a very good book, with just enough of sinfulness to admit of a great deal of penitence. It is far more wholesome reading than one of Miss Braddon's novels; of that there can be no question. But three volumes of Miss Braddon we could have skimmed with a tenth of the labour that we have spent on *Magnum Bonum*. Moreover, when we reached the end of them we should have a far clearer understanding of what we had been reading than we have now. For the thread of villany that runs through most of her tales affords an easy clue to follow. If we do now and then take a short cut and miss a few pages here and a few more pages there, we never run a risk of losing ourselves altogether. We stick to the villains, and we feel sure that they will guide us to a clear comprehension of the plot. But in one of Miss Yonge's tales—at all events, in her latter tales—we are at once hopelessly overwhelmed with the number of characters with which she floods her pages. It is almost useless, we feel, even to attempt to make the acquaintance of her first set of people; for by the time that our tired memory shall have nearly accomplished the task a fresh set will rise up, to be followed soon by yet another. We become almost as much bewildered as an unfortunate stranger who should be taken to a dance in some country town where the half-dozen branches of one important family are the leading people. He makes one vain attempt to master the names of the cousinhood to whom he is introduced; but soon finds that he must content himself with looking upon every second partner he has as a Miss Smith.

It is perhaps the case that many of Miss Yonge's readers were introduced to her characters somewhat gradually. Her story perhaps first appeared in the pages of some magazine. Had we read a portion every month, there would certainly never have been any vast call made upon the memory at one time; but then by the beginning of the second month we should have entirely forgotten all that we had read before. Had we been wise, receiving as we did the story in its completed form, we should have begun at once by making an abstract of the characters, as we made one years ago, when we were at the University, of the Kings of Judah and Israel. We were not, however, wise at the time, and we have never had resolution enough to go back and make up for our neglect. The result has been that in reading the book we have been in a hopeless confusion for many hundred pages. There are in it two numerous families of cousins, all Brownlows. Some of them have also the same Christian name. There are, we know, two John Brownlows. These two Johns both become medical

* *Magnum Bonum; or, Mother Carey's Brood.* By Charlotte M. Yonge, Author of the "Heir of Redclyffe," &c. 3 vols. London: Macmillan & Co. 1879.

men, and both fall in love with the same girl. They were a source of constant vexation to us, so greatly were we confused between the pair of lover cousins. In fact, we never did fairly disentangle the other members of these two families of children. We were always wishing that one of the medical lovers had been christened Tom, or that there had been another young lady provided. In the latter case, we could have known them by their sweethearts.

Miss Yonge no doubt feels that her strength lies in the description of children. But even of children there can be too many, both in real life and in the pages of a story. We cannot complain that she makes her children too good. On the contrary, they are often very sinful indeed. The modes taken to bring them back to virtue are perhaps somewhat violent. One of the Johns, for instance, at the time when he was a reprobate, with a younger and a very delicate brother, passes the night on the side of a glacier "in a dense white fog that shut them in with a damp, cold, moist curtain of undeveloped snow." They are both attacked by rheumatic fever, and both nearly lose their lives. The delicate boy, long before the night on the glacier and the fever, was of course a young saint. His elder brother from this time ceases to be a scamp, and becomes the better saint of the two. But, while piety is no doubt diffused by such narratives as this, it is a great pity that so much bad English should be diffused at the same time. If schoolboys find their silly slang put into very proper books, they are little likely to get cured of using it. After all, there is nothing gained by its introduction. There is nothing humorous in it, as is shown by the rapidity with which it is picked up by the greatest blockheads when they first go to school, and by the ease with which it is copied from them at home by sisters who are scarcely less stupid. Scarcely more amusing are the specimens of schoolboy blundering with which not a few pages of this story are filled. This kind of thing, when it was first brought into our story-books, was not over lively; but surely every one must be more than satiated with it by this time. Miss Yonge has before now given us a good deal of it, and Mr. Ascott Hope has spread it out till it makes the best part of whole chapters, if not of whole books. Others have followed in the same line. Yet we are treated in *Magnum Bonum* to some more of it in such a passage as the following, where two boys are brought in, one preparing his Virgil, the other working at a sum:—

> "I say, what does *pulsum* come from?"
> "What a brute this is of a fraction! Skipjack, what will go in 639 and 852?"
> "*Pulsum*, a pulse—*volat*, flies. Eh! Three'll do it. Or common measure it at once."
> "Bother common measure. The threes in———"
> "*Fama*, fame; *volat*, flies; *pulsum*, the pulse; *cecisse*, to have ceased; *paternis regnis*, in the paternal kingdom. I say, wouldn't that vile Perkins like fun?"
> "The threes in seven—two—in eighteen———"
> "I say, Johnny, is *pulsum* from *pulco*?"
> "Never heard of it."
> "Bobus, is it *pulco, pulxi, pulsum*?"
> "*Pulco*—I make an ass of myself," muttered Bobus.
> "O murder," groaned Johnny, "it has come out 213."
> "Not half so much murder as this *pulsum*. Why it will go in them both. I can see with half an eye."

A quick writer, if he had only a good supply of quill pens, ink, and paper, could surely spin out miles of such poor stuff as this. It is indeed far easier to write such descriptions than to read them when they are once written. Miss Yonge by long practice has acquired a most fatal facility of composition. Her pen runs on so easily, her words flow out so fast, that she can no doubt throw off her pages with as little effort as a tree sheds its leaves in autumn. She need trouble herself very little about a plot, and not at all about the general arrangement of her story. She has apparently a never-ending supply of naughtiness and penitence. A sinner gets a certain amount of law, as it were, given him; just as he seems really likely to become almost interesting, he is pulled sharply up by an accident or an illness, or by "an elderly clergyman with silvery hair," who comes in to spoil sport. Then another character is taken in hand, who is treated in much the same way. The chief sinner is indeed carried off by yellow fever, but then she had first arrived at a state of penitence. The next greatest sinner, to be sure, marries an heiress who had 40,000*l.* a year, but he had first become very penitent also. He really, from a worldly point of view, deserved the yellow fever ten times as much as the other; but we greatly doubt whether, with all his penitence, he would have been accounted by the author's admirers as quite worthy of so distinguished a death.

It is impossible, of course, to refuse to admit that in this book there is not a little that is clever. Miss Yonge could not write 956 somewhat closely-printed pages and keep steadily dull. But in 956 pages even a good deal of cleverness may get so well hidden away that the reader may almost despair of finding it. The story opens well. There is a pleasant old lady and an interesting young doctor, but they both are killed off before the end of the third chapter. We must protest against this habit of making away with good characters so early in the story. When we come across an instance of it we feel ourselves not a little aggrieved. We are vexed much in the same way as any one is vexed who in a country village has taken the trouble to call on some new comers, welcomes them to his table, and then finds that they only propose to stay in the neighbourhood a few weeks. There is, moreover, not a little originality in the character of the mother of one set of heroes and heroines. One of the Johns—we almost forget which—is also drawn with some power. In the sayings of the children there is often something pretty or lively. But then we return to the old grievance. There are so many characters, and so much talk, and so many words, and so many pages, and so much penitence, that the impression left on our mind is one of unutterable weariness. So far from feeling improved and edified by the story, many a reader, we are sure, would be tempted to go and do in downright defiance something highly improper, if not actually profane. We can imagine that a man who should be compelled to read *Magnum Bonum* through from beginning to end might the very next Sunday morning, in a spirit of revolt, lie on his back on a tombstone and smoke his pipe in the face of the beadle himself. But, after all, this is not a book for men, and perhaps it is hardly fair for one of them to venture to criticize it. The ladies, we feel sure, will one and all maintain that we have been unable to enter into its spirit, and so have failed to do it justice.

KERAMIC ART OF JAPAN.*

THREE or four years ago we noticed the commencement of this admirable work, when we reviewed the first two numbers and called attention to the beauty of the illustrations. On that occasion we concluded by expressing a hope that the authors would find such encouragement from the public as would enable them to bring so costly an undertaking to a satisfactory conclusion. We may now congratulate them on having fulfilled their design, though the last part was long delayed, owing to the engagements of MM. Didot, the chromo-lithographers, at the Paris Exhibition. Meanwhile the Essay on Japanese Art, which forms an important portion of the letterpress, was finished, as well as the companion Essay on Keramic Art, separately considered. In the parts now before us we have the accounts of Hizen ware, Satsuma ware, and Kaga ware, besides the special descriptions of the plates. These plates fully maintain the promise of the early parts, with the exception of one or two which appear unnecessarily hard; but whatever is lost in pictorial effect is gained in exactness. Against them may be placed the representations of Kioto ware in Plate XXXV., which appears to be the best picture—considered as a picture—in the book, and the splendid view of a Hizen jar (Plate VI.)

The final instalments of the general essay contain interesting notices of three favourite subjects, or sets of subjects—Buddha, Fusiyama, and the Seven Deities of Good Fortune. These notices are introduced by some critical remarks on decorative art, which are worth repeating. All branches of Japanese art are decorative. The correct principles of an art which is only decorative differ of necessity from those which govern the production of what we in England prefer to decoration—namely, separate pictures. The Japanese artist is a devoted student of natural scenery. He loves nature and paints landscape accordingly. But we have no evidence that he has ever made a special study of perspective. There has been no Japanese Turner, no Cox, or De Wint, to work up scenery into tablets as Wordsworth worked it into sonnets. But every Japanese peasant has his painted rice-bowl, his decorated fan, his ornamental cup. Here pictures are produced and hung in galleries and cabinets, while articles for every-day use—pots, pans, kettles, cauldrons—are hideous. Japanese art is essentially popular, we had almost said vulgar. English art, in spite of all that has been done and is being done to bring it home to the masses, is essentially particular, made for those who can afford to pay for it, and only brought to the notice of the lower classes by occasional and spasmodic efforts. It may be true that Englishmen as a nation have not in them that originative artistic faculty which makes art a necessity to the Japanese. But that they do care for beauty in their surroundings is proved by a hundred examples. The gorgeous, and sometimes really tasteful, decorations of the gin-palace are not lavished recklessly or without careful calculation of the effect they will produce on the minds of men whose homes are plain to ugliness; nor is the effort made in vain. When the Englishman can paint and draw for himself as the Japanese can, then we may expect to see whitewashed walls covered with sketches, and doors and shutters decorated in colours. Meanwhile we must be content to set up drawing-classes in night schools and the study of art in free libraries and galleries as counter-attractions to the public-house. Perhaps the spread of education may raise the standard of taste in the next generation. But though, with a great expenditure, we may at length attain this freedom, the Japanese workman and peasant was born in it; and that it does not depend upon a knowledge of letters may be proved by a reference to Italy, where every child has a knowledge of art, and can point out the best light in which to see a painting. The various pictorial instincts of nations, however interesting they may be to the student of ethnology, are not of course discussed by Messrs. Audsley and Bowes, who content themselves with only such remarks on the abstract definition of decorative art as bring out clearly its true position. But, though familiar in their daily lives, the art of the Japanese "cannot be called monumental at all." It has been objected to it that no perspective is studied, no aerial effects attempted. But the humble artist of Japan "knows as much of perspective as his works require, and quite as much as is commonly found in the

* *Keramic Art of Japan.* By G. A. Audsley and J. L. Bowes. Parts IV., V., VI., and VII. Liverpool. For Subscribers.

most correct efforts of other countries; he is infinitely more appreciative of, and truthful to, the principles of nature in his representations of animate and inanimate creation than any Western artist, while as a colourist he is not surpassed by him." It may be a question for us whether we should not be benefited if the genius of a large number among our young artists could be turned away from the painting of pictures and directed to "mere decoration," and whether the present tendency in that direction, especially in ceramic art, has not had a good effect, not only on the appearance and comfort of our domestic institutions, but also on the fortunes of the artists themselves. It is curious to observe how quickly a good design spreads. No sooner has some artist built a house, or drawn a table, than it is reproduced. The new houses in some neighbourhoods are all copies, in builders' style, of a good design by some great architect who has set the fashion. A great artist in furniture might find public appreciation nowadays; there can be no doubt of the success of some recent efforts to improve hangings and coverings for upholstery; and a very plausible theory may be supported that beauty is, like truth, *magna, et prevalebit.*

The highest efforts of Japanese sculpture have been made in the representations of Buddha. A wonderful statue is in the temple of Kama Koura. It was made six hundred years ago, and represents the great Hindoo reformer enjoying his "nirvana," or that ecstatic disregard of outward things which he held out to his followers as the highest good and final reward. The face is portrayed as "reflecting a sentient soul absorbed in its own impassive bliss, having attained to all knowledge, yet disclosing none of it, baffling all inquiry into the unknown, and promising as consolation for all personal ills a like impersonal happiness, or else an absolute annihilation, just according to the interpretation each believer gave to this spiritual riddle." The gigantic figure inspires less awe "from its massive severity of form than its inscrutable calm and measureless distance from mundane interests and cares." All the statues of Buddha which come to us from Japan are modelled after this one, and all are remarkable for the same air of holy calm and passionless repose. Mr. Jarvis, from whom the authors quote their account of the statue at Kama Koura, very well remarks that "the Oriental sculptor, in obedience to his abstract motive, was obliged virtually to reverse the practice of his Grecian brother. He tried to make men godlike on the physical and intellectual plane of well-understood human constitution. The former proposed to himself the more arduous task of sinking both into an abstract spiritualization, negativing all merely human faculties and ambitions, and creating an ideal form which should suggest a consummate, perfected bliss, destitute of every earthly taint or reminder."

What figures of Buddha have been in one department, views of Fusiyama have been in another. The whole range of Japanese landscape is pervaded by the outline of the snowy cone everywhere reverenced throughout the islands, which is traditionally accounted the temple, the grave, and the monument of the founder of their religion. Two hundred centuries ago, so runs the legend, Fusiyama arose in a single night from the ocean. To the mind of every native the form of the volcano is the perfection of mountainous beauty. "It is painted, embossed, carved, engraved, lacquered, modelled on all their wares; men carry it in their pockets, women wear it on their persons, children by the roadside build miniature Fusiyamas of mud." In p. liv. we have a whimsical example in an ornament of Owari porcelain, painted in blue, which represents a moon rising from behind the sacred peak. Fusiyama, though nearly a hundred miles from Yedo, is yet distinctly visible from the outskirts, for it rises to a height of between fourteen and fifteen thousand feet. "The Japanese are, however, not content with representing it from one point of view, or as seen under one condition of the atmosphere." They study its features in all moods, and whole volumes are devoted to representations of it. The authors describe one book containing four-and-twenty full-page views into every one of which Fusiyama is introduced in a different position and with a varied outline. On the top is the modest, unpretending little hut, the temple and goal of all the native pilgrimages. It is described as adorned with a few images in lava and some tinsel. The primitive worship of the Japanese is very free from the coarser forms of idolatry; but the writers quote a passage in which the Japanese Buddhism is spoken of as more coarsely materialistic than Romanism. The two sects, or to speak more exactly, religions, exist side by side, and both enter largely into the art of the country. To the Shinto form of worship may be attributed the almost universal homage of the seven deities of Good Fortune, "the true household gods of the laughter-loving Japanese." Figures of them are in every house; pictures of them are in every kind of pottery and lacquer. Yet the people do not seem exactly to worship them as idols, nor are they supposed in any way to influence the future state. They are merely temporal, and are regarded only as influencing the destinies of living mortals. They are not gods like the Roman household gods. They are not worshipped by any sect or supported by any form of priestcraft. They do not always occur together. Each man seems to have selected the Good Fortune he most desired for his peculiar reverence. For almost all, Long Life; for the poor, Daily Food and Contentment; for the rich, Love and Glory. The whole seven are sometimes represented together as on a plate figured at p. lx., but a selection is made for separate devotion. The genius of Daily Food is represented as a fisherman, as indicating the part which the sea must have played in the early history of the people. All show the same signs of remote antiquity, and readers of Messrs. Audsley and Bowes's volumes will be able to identify them with ease in many a long familiar picture among the surroundings of their own homes.

We have had little but praise to bestow on this handsome work. The authors have given us more than a mere history of Keramics. They have told us something about the sister arts, and we should be glad if they gave us reason to look forward to similar books on the subjects they have but touched—carving in ivory and wood, bronzes, and, above all, lacquer. What they have said about them has only made us wish for more.

GERMAN LITERATURE.

It has been reserved for a German scholar, Dr. Alfred Katterfeld (1), to write the first detailed biography of so eminent an Englishman as Roger Ascham, and to display him in a point of view hitherto much overlooked by his own countrymen. Ascham was not only one of the fathers of modern culture, but one of the first men in whom the modern instinct for observant travel was developed; he was a more inquisitive and intelligent scrutinizer of foreign manners, Dr. Katterfeld thinks, than Cardan or Montaigne. It also happens that the most important of his travels were performed in Germany, and at a very critical period of German history—circumstances which have naturally increased Dr. Katterfeld's interest in a department of Ascham's activity which his own countrymen have as naturally neglected. Ascham's observations are conveyed in a little undated book, which Dr. Katterfeld considers not to have been printed until some years after the accession of Elizabeth. Even more important, perhaps, are his official letters as secretary to the English Ambassador Morison, and the remains of his extensive private correspondence. His diary is unfortunately lost, and seems to have been destroyed from prudential motives. The vivacity of his descriptions and the penetration of his remarks justify his biographer's praises. He witnessed the humiliation of Charles V., whom he had found at the height of his power, by Maurice of Saxony; he also saw the siege of Metz. Maurice's character is very carefully and impartially drawn by him. He visited Augsburg, then almost the richest mercantile city of Europe; Cologne, the bulwark of the old faith, and Magdeburg of the new; and his observations on all show admirable insight into the circumstances of the time. Visiting Germany in the service of Edward VI., he writes as an ardent partisan of the Reformation, and such no doubt was his sincere conviction. Like most of the Humanists, however, he was far from possessing the spirit of a martyr. In his youth he had disguised his opinions to retain the favour of his patron, Archbishop Lee; after his return from Germany he accepted the post of private secretary to Queen Mary, notwithstanding the change of religion and the execution of the unhappy competitor of whom he has himself left so fair a portrait, and in connexion with whom his own name is chiefly remembered. It is uncertain whether he openly abjured the Reformed faith, but most probably he did not; and his connexions appear to have lain among the most moderate men of the Catholic party, Pole, Heath, and Gardiner. He retained his post at the accession of Elizabeth, and continued to enjoy her favour until his decease in 1568. Dr. Katterfeld has performed his task with laborious thoroughness, examining all extant MSS. except some few to which he was refused access by the discourtesy of the possessors—a great contrast, we are glad to say, to the general tenor of his reception in England. He has corrected numerous errors of his predecessors, especially Dr. Giles, and has added a useful bibliographical notice of the various editions of Ascham's works. His style is simple and clear; his treatment of his subject sometimes almost amusingly methodical and matter-of-fact. It was hardly necessary to point out that Landor's *Imaginary Conversations* cannot be accepted as an authority for the life of Ascham.

Herr Georg Kauffmann (2) expresses the opinion that sufficient monographs have been written upon the various points connected with ancient German history, and that the time has arrived to condense the results obtained into a single comprehensive work. He therefore undertakes to compress the history of the Teutonic race before Charlemagne into two volumes of moderate dimensions. The endeavour after brevity is most laudable, and the execution is such as to show that Herr Kauffmann can distinguish the essential from the unessential, and has thus a grasp of one at least of the principal requisites for success in history. Should his success be incomplete, the cause will be no deficiency in yet higher historic qualities, but adherence to the guides upon whom, very probably with good reason, he has chosen to depend. He follows Roth and Sohm; and, if these writers' views on ancient German institutions have really provided him with the indispensable groundwork of archæological accuracy, there need be no fear for the superstructure of historical narrative which he has erected upon their foundations. Kauffmann is, in truth, an admirable narrator, clear, concise, and masculine; while his views of men and things reveal a generous temper and a ready sympathy for whatever is excellent. This is especially the case

with the latter part of his volume, where he has to depict the great figures of Ambrose, Alaric, and Stilicho. The present instalment of the work comes down to the death of Alaric's successor, Athaulf, in 415.

The fourth volume of Schlagintweit's Travels in Central Asia (3) is more interesting than its predecessors, being less of a mere catalogue of measurements of the heights of mountains and barometrical tables, and containing a reference to at least one interesting event, the murder of the traveller's brother Adolph, although even this is only narrated upon hearsay. As a rule, however, the narrative is extremely dry; and, as such, fully in keeping with the barren and monotonous character of the desolate country it describes. The most interesting part is perhaps the summary of the expeditions of other travellers, principally Russian and English, the latter mostly of so recent a date as to have almost superseded Herr Schlagintweit, the amount and importance of whose discoveries is by no means such as to explain his quarter of a century's delay in publishing them.

A German translation of General di Cesnola's invaluable work on the archæology of Cyprus (4) is accompanied by a preface by Georg Ebers, and varies from the original in the arrangement of the plates, which, instead of being incorporated with the text, are thrown together at the end of the volume.

August Man's work on Pompeii (5) is not an addition to those manuals of general information respecting the city of which so many already exist, but is principally confined to the single point of the history and development of Pompeian architecture. The writer seeks to determine, in the first place, the period of erection of the more important edifices; secondly, their original style and construction; and, thirdly, the nature, date, and object of the alterations they underwent previous to the destruction of the city. The book is, to a considerable extent, a criticism upon the "Pompeian Studies" of R. Nissen, and contains like it ample and accurate measurements, and minute investigations of all the details of ancient architecture.

No works on mediæval art and archæology have attained or deserved a higher reputation than the splendid publications of Dr. von Hefner-Alteneck (6), and their value is enhanced by their being now combined in the same issue. In 1840 Dr. Hefner began the publication of his celebrated "Costumes of the Christian Middle Ages, from Contemporary Monuments." This magnificent book was completed in 1854, and during its progress the author had already commenced the companion volume on the art of the mediæval period and the Renaissance, which occupied him until 1863. The two books now appear as a single work in 120 parts, three of which have already been published. The selection of subjects for illustration has been revised, the illustrative text greatly improved, and the scope of the treatise extended so as to embrace the seventeenth and eighteenth centuries. The progress of chromolithography allows the plates to be executed by that method, instead of being coloured by hand as in previous editions. The first three parts comprise Byzantine and Carlovingian subjects to about the end of the ninth century, derived from mosaics, illuminated MSS., and the actual objects represented. Nothing can be more splendid and exquisite than the execution, especially of the magnificent plates representing Justinian and Theodora among their courtiers, and Charles the Bald upon his throne.

Professor Schultz's (7) treatise on the manners and customs of the upper classes in the middle ages, principally Germany, from about 1130 to 1300, is one of great interest and value. It is founded on a very thorough investigation, partly of architectural remains, partly of allusions to ways of life in the literature of the age, especially the contemporary metrical romances, which are full of references to courtly manners and the refinements of advancing civilization. The first chapter is devoted to domestic architecture, including both the exterior construction and internal arrangements of those castles in which the characteristics of a palace and a fortress were combined. The private life of the inmates is next amply detailed; their costumes, amusements, furniture, articles of comfort and luxury, and the machinery of everyday existence in general. The last chapter is devoted to the important subjects of love and marriage, and the intellectual and moral aspects of mediæval civilization will probably be more fully treated in the new volume. The writer's principal reliance is on the contemporary poets, who have, as he remarks, preserved the memory of innumerable customs and objects of use which would otherwise have fallen into oblivion, and whose deficiency in the inventive faculty guarantees the accuracy of their descriptions. He states that he has read upwards of two million verses for the purposes of his work. Next in importance come the works of art in the shape of illuminated manuscripts, painted windows, and sculptures, of which upwards of a hundred examples are given. This work is altogether most valuable, and its only apparent defect is a deficiency in methodical arrangement.

Forestry in its economical aspect is a matter of primary importance on the Continent, and may one day become so in England. According to Herr Geyer (8), the science is degenerating in his country; a fact, if true, of some importance to England, as some of the officers of our Indian Forest Department receive their training in Germany. Herr Geyer attributes the falling off in productiveness to the neglect of financial considerations, and to a defective method of management which impoverishes the soil and impedes the renovation of the wood by natural processes. The Saxon forests are an exception to these remarks. The book is full of interesting details, both silvicultural and economical.

Wundt's Logic (9) is one of those treatises which will probably be hereafter cited as making an epoch in science, but which from their compass and thoroughness are but slowly mastered even by specialists, and require time ere their proper position can be assigned to them. Professor Wundt is indeed anxious not to repel readers by over-abstruseness, and, although fully impressed with the importance of mathematics as an auxiliary to logical processes, has considerately relegated all mathematical formulæ to two special chapters. There is, notwithstanding, abundant scope for severe mental exertion in a treatise by no means confined to technical logic, but which also deals with their application to such fundamental physical and metaphysical problems as causation, force, the reality of time and space, absolute existence, and teleology. The application of the methods of investigation employed in the exact sciences to logic is perhaps the most distinctive feature of the work, and may be expected to be still more prominent in the second and concluding volume.

The essays of so learned a jurist and precise a thinker as Professor Bluntschli (10) well deserve to be collected. Eleven treating of jurisprudence and general polity are included in the first volume. Among the most remarkable are one on the fundamental conception of law, pointing out the confusion between law and religion in the minds of Orientals, and the endeavours of Ultramontane Catholicism to introduce the theocracy grounded on this confusion into Europe; an exposition of the moral and intellectual qualities which confer superiority on the Aryan race; an attempt to discover a *modus vivendi* between Church and State in the marriage question; and an essay on the ideal State, in which Bluntschli ventures on the prediction that the world will eventually become one nation. Though frequently profound, the author's thoughts are everywhere intelligible, and his diction is everywhere transparent.

In the first part of what promises to be a very comprehensive work on Idealism and Positivism, Herr E. Laas (11) analyses the philosophy of Plato as the typical representative of the former theory, whose writings contain, actually or by implication, nearly everything that can be advanced in its support.

The conclusion of Professor Teichmüller's essay on the nature of love (12) is that all love is but the love of the Divinity under veils and symbols—a conclusion not dissimilar from that of Mr. Emerson and the Persian mystics, different as is the road by which Professor Teichmüller has travelled to it. His essay is distinguished by occasional eloquence and prevalent perspicuity of style.

Adam Friedrich Oeser (13) is now perhaps principally known for his intimacy with Goethe at an early period of the latter's life, and the influence he exerted upon the poet's development as an amateur and connoisseur of art. He was, however, one of the most eminent German painters of the eighteenth century, and, if unable to emancipate himself in his works from the conventionality and dilettantism of the time, at all events showed himself intellectually susceptible to higher influences by his cordial sympathy with Winckelmann, with whom he was allied during his residence at Dresden. It was at Dresden that Oeser's best work was performed. After his removal to Leipsic as Director of the Academy of the Fine Arts, his style became tame; but it was there that he made the acquaintance of Goethe, who preserved his veneration for his tutor until his visit to Italy, when, as he says, the scales fell from his eyes. Dr. Dürr points out, however, that this illumination did not extend so far as to enlighten Goethe on the merits of early Florentine art. Oeser died in 1799, at the age of eighty-two. His talents, if not surpassing, were versatile; though principally known as a painter, he also acquired distinction as a sculptor and engraver. Dr. Dürr's monograph is remarkably full and painstaking, omitting nothing that can throw light on Oeser's career, and especially his relations with his illustrious friend.

The association of Goethe's name with Gottsched's (14) in one and the same volume seems singular, but is accounted for by the fact that both Herr Bernays's biographies are reprints from the great national biographical dictionary at present in course of publication by the Munich Academy. As an article in an encyclopædia, Herr Bernays's essay on Goethe leaves nothing to be desired, and even as a miniature biography it may be most useful as a handy volume of reference. Its chief defect is the writer's inability to rise above the strictly national point of view. It is unfortunate that all German books on the subject are thus far merely contributions to the literature of Germany. Some day, no doubt, a German biographer will arise who will treat Goethe with the same impartiality as if he were a foreigner; but for such treatment the present excited condition of national sentiment is most unpropitious. In his second memoir Herr Bernays makes out a very good case for Gottsched, reminding us that his canons of criticism were inevitably formed before the appearance of Klopstock and Lessing, and that he would probably have been one of the most effective auxiliaries of the new school if he had been born twenty years later.

In a very interesting and careful volume of biographical and literary criticism, Freiherr von Biedermann (15) investigates some of the more minute and obscure points connected with the works of Goethe. Among the most interesting are those relating to the unfinished dramas, especially *Elpenor*, in which Goethe seems to have designed to shadow forth his attachment to Frau von Stein, and the plot of which Freiherr von Biedermann shows to have been derived from a Chinese source. The projected "Christian Tragedy" is shown to have been inspired by Calderon, and it is made highly probable that the eccentric educational reformer Basedow is the original of "Satyros." Another essay investigates Goethe's contributions to the *Frankfürter Gelehrten-Anzeigen*, and another treats of the principles of rhyme observed by him. The more strictly biographical part of the volume discusses his relations with the Fritsch and Fikentscher families, and his letters to Voigt, Eichstadt, and other minor correspondents.

Berthold Auerbach has been only too prolific of late years. For the second time within twelve months we receive a new volume from his pen. *Der Forstmeister* (16) is a bright, readable story of country life, abounding in idyllic scenes and picturesque descriptions. The principal characters perform the antagonistic parts of villain and victim. The plot is slight, and the author's chief attention has been bestowed upon the delineation of character. Jörns and Ruland are types of native honesty and simple vigour; the heroine is attractive and wholesome; so also is the Vicar, a guileless enthusiast, humorously but sympathetically portrayed. The novel is healthy and agreeable throughout, though devoid of stirring incident or any very definite purpose.

Dr. Virchow's account of his visit to the scene of Dr. Schliemann's discoveries at Hissarlik is the most attractive contribution to the January number of the *Rundschau* (17). He discusses the topography of the plain of Ilion, and especially the alterations which the courses of the rivers have undergone since Homer's time, and directs especial attention to the character of the valuable objects discovered as articles of luxury brought from abroad, the hoard of a mountain chief who must have had a name, and whose name may as well have been Priam as any other. There are also a continuation of the Prussian officer's autobiography, treating of his entry upon military service; and a continued narrative of the resolute, but hopeless and ill-judged, effort of the Poles to shake off the Russian yoke in 1863. The Darwinian theory of facial expression is criticized in another article; and another is devoted to Edgar Quinet, distinguished among illustrious Frenchmen for his German sympathies, and whose own character offered most of the traits that constitute the German poetic and philosophic ideal. It is difficult to make Henry II. and Becket live for the reader of the nineteenth century, and "The Saint" is too deficient in local and historical colouring for such a feat. A little sketch of the peasant life of North Germany is, on the other hand, perfectly true to nature.

THE LIVERPOOL ELECTION.

THE Liverpool election contains almost every element of popular interest which can be found in such contests. Both Conservatives and Liberals are enthusiastic and among themselves unanimous. The meetings on both sides, after filling the largest buildings in the town, overflow into neighbouring spaces. The Conservatives are laudably anxious to reassert their superiority, while their adversaries are not less naturally animated by the hope that they may on this occasion reverse the balance of parties. Amongst other grounds of confidence the Liberals rely on a local influence which was on former occasions used against them. Lord RAMSAY, in one of his earlier speeches, took occasion to remind his followers that he was staying at Knowsley. Lord SANDON, with more adroitness, appealed to the proper jealousy of independent voters, who were, he said, not likely to change their opinions because an eminent neighbour had changed his own. Lord DERBY has not, since his secession from the Cabinet, explained how far he has identified himself with the Liberal party. Perhaps it is enough to know that he is as eager as any member of the Opposition to turn the present Government out of office. Only inhabitants of Liverpool can calculate the number of votes which represent the electoral influence of Knowsley. Another and more powerful body of voters occupied at the beginning of the struggle a position not unlike that which was held by Lord DERBY's ancestor at Bosworth. The Irish Home Rule voters considered that they had power to decide the contest; but until their terms were accepted they kept within their own camp, declining to pledge themselves to the party which courted their alliance.

The Conservatives must be acquitted of any charge of tampering with the enemies of the English connexion. From the first their candidate has professed his determination to vote against any proposal tending to Home Rule. Lord RAMSAY, who seems to possess remarkable aptitude for the functions of a candidate, is on this and on other questions in the hands of experienced local advisers. He and his friends have thought that there was more to be gained than to be lost by assenting to the doctrine of local option. Lord RAMSAY confessed that he had not studied the question whether it was expedient to facilitate the spread of contagious disease. As to Home Rule, he in the first instance repeated the formula lately devised for the use of Liberal candidates by Mr. GLADSTONE himself. Lord RAMSAY would gladly hand over Irish private Bills, about which no Home Ruler ever troubled himself, to any authority which might at any time be constituted for such purposes in Ireland. More generally he offered to support any extension of local self-government, which also was a vague concession, not at present required by any party in Ireland. It seemed that the further undertaking to vote for inquiring into the expediency of creating an Irish Parliament had been thought too dangerous. Mr. GLADSTONE has not yet agreed to the repeal of the Union, or to the separation which would be the first act of an Irish Legislature. It was a still stronger argument against the pledge demanded that it might alienate more support from English voters than it would purchase from Irish Home Rulers. Lancashire and Liverpool have not been in the habit of regarding with especial admiration and deference the Irish immigrants who form a considerable portion of the community. It is probable that even Liberals may resent a claim to determine English contests by votes given at the dictation of demagogues who profess open hostility to England.

The tactics of the Home Rule League, which by a singular accident has the power of interfering in the representation of Liverpool, were not the same which were lately employed at Sheffield; but it was reasonably assumed that eventually the result would not be different. Mr. SULLIVAN and some of the other managers have taken part in both elections, and there seemed to be no reason why they should be more exacting at Liverpool than at Sheffield. Lord RAMSAY was, as far as pledges were concerned, more accommodating than Mr. WADDY, and yet his offers did not at first obtain equal consideration. It was perhaps because Lord RAMSAY was so ready to make large concessions that the Home Rule League rightly thought it possible to exact something more. Their ultimate decision was never doubtful. If they can elect Lord RAMSAY, they will add strength to the only party from which they have anything to hope. Mr. GLADSTONE has not been repelled by the encouragement afforded to anarchy and crime by the Home Rule League, of which he incessantly solicits the alliance. It is notorious that the members of the body who formerly affected moderation have now accepted the doctrines and practice of Mr. PARNELL. Their leader lately boasted at a meeting in the United States that they could return seventy members for Ireland and forty for Great Britain. Among the forty he probably includes Mr. WADDY, and he will have a perfect right to include Lord RAMSAY, should he be returned for Liverpool. Lord RAMSAY and his friends at the beginning of the auction made a liberal bid, though the customer affected to reject the offer with scorn. They rightly judged that they would only have to wait till the market was on the point of closing to find that the bargain was concluded. The secret of the ostensible neutrality of the Home Rule League has already received a painful explanation. It now appears that Lord RAMSAY had told their delegates that he was personally ready to vote for an inquiry into the expediency of an Irish Parliament, but that he could not separate himself from the leaders of his party. Having since apparently satisfied himself that no scruple of loyalty or patriotism will stand in the way of a combination to defeat the present Government, Lord RAMSAY has formally undertaken to comply with the demands of Mr. PARNELL and his allies. An inquiry into the reasons for establishing an Irish Parliament involves the admission of the whole principle for which the Home Rule League contends. No Committee can tell even so inexperienced and so reckless a partisan as Lord RAMSAY anything which he must not already know. An Irish Parliament, even if it were nominally restricted to the functions of an American State Legislature, could not be instituted without a disruption of the monarchy. Its leaders, who would be the Nationalist and Fenian agitators, would disregard any limitation which might have been imposed; and the reserved sovereignty of the Imperial Parliament could only be asserted by the exercise of force. Civil war, and the repeal of an impracticable measure, would almost certainly follow: and the only compensation for incalculable evils would be that Lord RAMSAY had gratified his personal ambition, and perhaps that Mr.

Gladstone had overthrown his hated rival. The contract between the Liverpool Liberals and the Home Rule League may perhaps have been prematurely published. It may not be too late for the real constituency to condemn the most unprincipled of modern political transactions.

Lord Sandon's effective speech was almost exclusively devoted to the issue on which both parties have tacitly agreed to conduct the present contest. On neither side is there any indication of serious interest in domestic policy or legislation. Foreign and Indian affairs are the ostensible subjects of a conflict which is really a trial of strength according to the type of old-fashioned elections. Liberal orators cannot conveniently go far back in the history of the Eastern controversy, because the acts which they would denounce were those of Lord Derby. As Lord Carnarvon has no local connexion with Liverpool, they may not be equally embarrassed in dealing with the annexation of the Transvaal; but the electors are thinking, not of Turkey, or South Africa, or Afghanistan, but of the comparative value of blue and yellow, or whatever may be the respective colours. External politics are well adapted to such trials of strength; for the principles of rival parties are not in any way involved in disputes about the Treaty of Berlin or the Afghan war. Not many years ago, Lord Palmerston, then leader of the Liberal party, was supposed to be constantly engaged in the promotion of English influence abroad. Mr. Disraeli sometimes criticized the turbulent activity which he imputed to the Minister, though he never thwarted his policy when English interests were engaged in diplomacy or in war. The reduction of the contest to a mere comparison of the numerical strength of parties may perhaps be advantageous to the Liberals. It is probable that few of them are at the moment prepared to abandon the party, although at Liverpool, as elsewhere, prudent men must be alarmed at the violence of Mr. Gladstone and Mr. Parnell. It is impossible to judge at a distance of the disturbing tendency of the petty issues which are raised by the advocates of special legislative theories. It may be inferred from Lord Ramsay's adhesion to the doctrines of Sir Wilfrid Lawson that the temperance agitators at Liverpool command a considerable number of votes; yet he would probably have shown sounder judgment if he had dissented from measures which are obnoxious, not only to publicans, but to the much larger body of consumers. The Liberal candidate has not been asked to pledge himself to the disestablishment of the Church, though the so-called Liberation Society has lately imposed on Liberal candidates a graduated series of tests, to be administered according to their supposed pliability. They may be well assured that Lord Ramsay, as at present advised, will vote with Lord Hartington, or, more probably, with Mr. Gladstone, on any question relating to the English or Scotch Establishments. If Mr. Whitley defeats the combination of Liberals and Home Rulers, his party will have achieved a signal triumph. Lord Ramsay's success, if it depends on the Irish vote, will have no moral weight, if indeed it has not a ruinous influence on the fortunes of his party.

THE GERMAN ARMY.

The announcement that Prince Bismarck is contemplating an increase in the German army would have excited no surprise and little comment had it not been for the mode in which the announcement was made, and for the reasons for the increase which have been ostentatiously given. The strength of the German army in time of peace is fixed for a period of seven years, and this period will expire in about a twelvemonth. It is not only natural, but highly proper, that notice should be given some little time before the present septennial period expires of the amount of military force which is to be fixed for the next septennial period, in order that those who are to be affected by any change may have adequate warning. The number of soldiers under arms in time of peace is fixed in Germany at one per cent. of the population. During the last few years the population has rapidly increased; and, in order that the ratio may be maintained, 22,000 men are to be added to the army. The addition is not very great in itself, and is merely the addition which would naturally follow on the increase of population. If Prince Bismarck had been content to ask for a simple thing in a simple way, Europe would have paid no attention to his proceedings. But the mode in which he has made his demand is as far from simple as possible. He has chosen to terrify his countrymen with the spectre of an alliance between France and Russia, and he has proved on paper that the German army is weaker than the army of either of these possible allies. Against a combination of forces, each superior to his own, he wants as a safeguard twenty thousand more men, an amount which would become thrice as large in time of war. The safeguard seems hardly adequate to the danger, and it was not difficult to see that this picture of danger to Germany was painted, not for Europe, but for Germany itself. Prince Bismarck contemplates the possible alliance of Russia and France, but omits all notice of the actual alliance between Germany and Austria. The present state of things is a reason for decreasing rather than increasing the German army. Germany has doubled her strength by the Austrian alliance, and, it might be thought, could afford to rest and be thankful. But Prince Bismarck, although he is sometimes thankful, never rests. He may not wish for war, but nothing pleases him so much as to be in the position to get up a war any day with large chances in his favour. This position he has now created for himself. His policy, which has hitherto been very successful, is to isolate those whom he wishes to crush. He so managed things that Europe held aloof while he beat down Austria in 1866 and France in 1870. Russia is very nearly isolated, and her bad quarter of an hour might be very near were it not possible that France, ardently as she desires peace, would not look on quietly while her only Continental ally was being crippled or annihilated. The only offence Russia has ever given Germany is that in 1875 the Government of the Czar saved France from a new war being forced on her before she had recovered her strength. And it would be not merely gratitude, but the simplest instinct of self-preservation, that would prompt France to do for Russia now what Russia a short time ago did for her. But, through the Austrian alliance, Prince Bismarck has got something more than a vast increase of military strength. He has got an opportunity of starting once more the interminable Eastern question whenever he pleases; and he may speculate, not unreasonably, that, if things are well managed, England will be so alarmed that France will have to keep quiet under the penalty of a war with her great neighbour and friend.

Baron Haymerle has been unfolding to the Austro-Hungarian delegations the policy of his Government in a speech to which his hearers could take little exception. He assured them that the new alliance is not directed against France; that he is indifferent to the form of Government which France may adopt, and distrusts a Republic no more than he distrusts a Monarchy. He is quite right in this. France, under its present Government, has not the faintest wish for war, and the German alliance is not directed against France in the sense that the allies have in contemplation to send their troops across the French border. Baron Haymerle further expressed the sincere desire of Austria to see peace preserved, and there is no reason to suppose he was saying anything beyond what he really meant. Austria cannot wish for a war in which she would have nothing to gain; but, on the other hand, it must be said that Austria is now scarcely a free agent; and Prince Bismarck must be very much changed if he could not make her go to war whether she liked war or not. Nothing, again, could be more friendly and moderate than the terms in which Baron Haymerle spoke of the relations of Austria to Servia and Bulgaria. He wishes to respect the independence and promote the interests of those infant Principalities; and it is obvious that no Austrian statesman would be guilty of the folly of desiring by premature violence to annex two more discontented provinces. What Austria desires is not to own the Balkan peninsula, but to exercise a predominating influence over it; and it would cut at the roots of such an influence if she inspired the inhabitants of the peninsula with alarm or hatred from the beginning of their connexion with her. But here, again, it depends much more on Prince Bismarck than on Austrian statesmen whether they can persevere in their proper policy of caution and moderation long enough for it to produce the desired fruits. It may not suit him that the unhappy inhabitants of the peninsula should be left too long undisturbed. If war breaks out, Austria must defend the line of the

Danube, and would scarcely have any choice except to occupy territory which she might not wish to occupy, and the inhabitants of which would bitterly resent her intrusion.

If, then, Prince BISMARCK did not address his reasons for increasing the German army to foreigners, but to Germans, what, it may be asked, could have prompted him to make this grave appeal to the timidity or prudence of Germany when all he wanted was to get a small addition to the army and make it bear the recognized ratio to the population? No one, until Dr. BUSCH discloses the secret, can pretend to say confidently why Prince BISMARCK does anything. All that can be done is to give the best answer which his past history and his present political position suggest. He may have thought it judicious to familiarize the German mind with the notion of a war in which one of the two possible enemies of Germany could be wiped out before they had time to combine. But it may be conjectured that his chief motive was the comparatively humble one of wishing to carry his Bill. Unless all reports of what is going on in the country are untrue, Germany groans under her military burdens more than any other of the Great Powers. She may only be spending twenty-one millions a year in preparation for war, as against the twenty-seven which France is spending; but she is much poorer than France, and her population has suffered much more than the French have done from the recent bad times. Socialism, too, is constantly preaching the iniquity of the conscription, and the strength of German Socialism lies in the disposition of thousands of Germans to be Socialists up to a point, even though they do not accept the Socialist programme. The Progressists have already announced their determination to resist the new Bill to the utmost, and in order to carry it, Prince BISMARCK must secure either the National Liberals or the Centre. For different reasons each of these parties might, if they dared, be disposed to fall away from him, or at least bargain with him for their support. It may save him much trouble if he cuts away all ground for hesitation from both of them by getting it admitted beforehand that the country is in danger. A political opponent will thus be made to appear before his countrymen as a traitor or enemy if he throws any obstacle in the way of the Bill. Few Germans would dare to occupy so unenviable a position; and there is a general disposition among Germans to admit that they do not understand great affairs of State, and that Prince BISMARCK does. If he says the country is in danger, then they say and think it is in danger; and his opinions on the true position of Germany in Europe at any given moment terminate all discussion. If his disquisitions on the strength of the French and Russian armies are in the main merely a piece of Parliamentary manœuvring, foreigners need trouble themselves very little about them. But it would be rash to assume that they are only a piece of Parliamentary manœuvring, and he may have many other projects in his mind besides that of getting through the German Parliament his modest little Bill.

SOUTHWARK.

A SECOND important election will take place immediately after the meeting of Parliament; and the decisions which may be pronounced by two dissimilar constituencies will be expected with reasonable curiosity. It will not be easy for the electors of Southwark to find a candidate with the peculiar qualities of Mr. LOCKE. During the last two or three years he had, through bad health, become prematurely old, and he would have retired from the House of Commons at the dissolution; but he perhaps resented the eagerness with which a portion of his constituents prepared some time ago to take advantage of the vacancy. Mr. LOCKE was highly popular in the House, both as a sagacious politician of tendencies still more moderate than his opinions, and as a genuine humourist. It used to be said, perhaps by an intentional hyperbole, that he could sometimes make Mr. GLADSTONE laugh. If there was any foundation for the statement, the kindly weakness could certainly not be attributed to political sympathy. Mr. LOCKE had always belonged to the Liberal party; but he extremely disliked newfangled projects of change, and he sometimes in a few sentences succeeded admirably in making restless reformers ridiculous. His sarcasms derived additional effect from his voice and manner, which would probably have enabled him to succeed as a comedian of the graver sort. His successor is not likely to be equally amusing, but it may be hoped that he will possess an equal share of good sense and steadiness. In Mr. LOCKE's earlier days the system of primary assemblies and conventions of delegates had not been imported from America. If the machinery works smoothly in Southwark, the Liberal candidate will not be likely to distinguish himself by originality or independence.

The large population of Southwark, as of other metropolitan boroughs, has little of the social or commercial unity which exists in great provincial towns such as Manchester or Liverpool. London south of the river is as little beautiful or interesting as any large mass of buildings which can be found in the world. Southwark possesses a hop market, a few manufactories of an inferior order, and one or two great breweries, and it is traversed by several railways. There are no residents belonging to the upper middle class, nor can those who conduct the business of the place be considered as a mercantile aristocracy. Small tradesmen and working people form the bulk of the constituency; and they probably share the popular feelings and opinions of the day. The interest of the impending election will consist in the indication which it may afford of the impression which has been produced on the mass of the community by recent events and by the Liberal agitation. It may be said to the credit of the Southwark electors that they have returned to Parliament some useful and able members. It was in Southwark that Sir H. LAYARD first found a seat; and the borough had been previously represented by Sir W. MOLESWORTH, who attained to the rank of a statesman, and by Sir C. NAPIER, who satisfied the popular conception of a rough and gallant sailor. It is probable that the electors thought more of the Liberal professions of candidates than of their personal qualifications; but it was an honourable distinction to have risen above the level of other metropolitan boroughs. For many years the electors of London outside the City, with the partial exception of Southwark, were content to return mere political partisans of the humblest pretensions. It may be doubted whether the standard will be raised by the new process of preliminary selection. Some time ago the delegates who had, on Mr. GLADSTONE's recommendation, organized themselves after the American model proposed to subject candidates to a kind of competitive examination. Those who preferred their own self-respect to a seat in Parliament naturally declined a vulgar condescension; but the Two Hundred of Southwark had no difficulty in imposing their terms on more pliable candidates. It is not at present known which of the graduates at the local examination will be chosen to conduct the present contest. There was at the time some dispute between the Convention of Delegates and a body of working-men who wished for a candidate selected from their own body; but probably the internal dissensions may since have been composed. The late Mr. ODGER, an agitator of an almost revolutionary type, once received a large number of votes in Southwark. Another popular favourite of the name of DUNN, who is not known outside the borough, may perhaps be a candidate on the present occasion.

At Southwark, as at Liverpool, the party contest will be ostensibly waged n the issue of the foreign policy of the Government. It is extremely convenient to party managers to deal exclusively with questions which involve no political principle. Domestic affairs seem for the moment to have lost their interest; and Southwark voters would certainly not concern themselves with the tenure of land, with household suffrage in counties, or with County Boards. It is possible that some of them may feel an ignorant antipathy to the Established Church; but the Nonconformists have never been as numerous and powerful in London as in provincial towns. It will be the simplest and easiest plan to denounce the Afghan war, though probably few of the electors have studied its causes or its progress. Of late Liberal orators have almost ceased to discuss the Eastern question; and some of them have at last admitted that the complications with which the Government had to deal during the Russian war and after its close were not the work of the Government. The Afghan war might as probably have been undertaken by the Liberal as by the Conservative party. Sir JOHN HOBHOUSE, the kinsman and predecessor of the highly respectable candidate for Westminster, was officially responsible, as President of the Board of Control, for the former Afghan war. As a matter of fact, the present difficulty has fallen on a Conservative Government, and therefore it

may be a legitimate ground for Liberal attacks. The merits of the late Indian policy will be less considered than the trial of the strength of parties. Very few of the electors will give their votes on any other ground than their preference of the late or of the present Ministers.

In Southwark and in other constituencies which may have to choose members before the general election, another grave consideration will affect the votes of moderate and conscientious politicians. The country can scarcely have yet become so thoroughly demoralized by faction as to be prepared to prefer the interests of party to the unity of the kingdom. Until two or three days ago, no candidate for an English constituency had thought it consistent with his character or with his interests to purchase the Irish vote by a pledge that he would support an inquiry into the expediency of creating an Irish Parliament. If Lord RAMSAY and his local advisers acted on their own discretion, the startling innovation, though not to be disregarded, is of minor importance. The main security of a moral or political principle consists in its being taken for granted, and placed beyond the reach of controversy. The first violation of the rule may do incalculable mischief by establishing a precedent, or by furnishing future offenders with a security that they will not stand alone. Nevertheless Lord RAMSAY, though he has shown considerable ability during his canvass, can claim no political authority; and his submission to the Home Rule faction may possibly be attributed to inexperience and rashness. If he has acted on the advice of the leaders of the Liberal party, they also have committed themselves to a measure which on their part would be almost a crime. A promise to vote for an inquiry as to an Irish Parliament makes repeal of the Union an open question; and Mr. PARNELL and his colleagues can afford to hear with contemptuous toleration professions like those of Lord RAMSAY, that it is not intended to tamper with the integrity of the Empire. There must be many Irish workmen in Southwark, and those who manage them will not fail to follow the example of the Home Rule party at Liverpool. A candidate who has submitted to a preliminary examination will probably not be deterred by any feeling of personal dignity from giving any pledge which may seem likely to secure his return; but the policy of the Liberal party will probably be by that time disclosed, and if the leaders have capitulated to Mr. PARNELL, it is possible that a burst of national indignation may follow. Both the Liberal candidates for Westminster have expressed their determination to resist any pressure which may be put upon them by the Home Rule League. Mr. JOHN MORLEY expressly stated that he would not vote for inquiry into measures which he could in no circumstances approve. A Southwark candidate may perhaps be more accommodating.

MEXICO.

GENERAL GRANT, who has been seeing so many cities and peoples and nations, is going to end his voyage round the world by a visit to Mexico. He will arrive there early next month, and will be received with all the honours that Mexico can pay him. For some time the relations of the present Mexican Government to the Government of Washington were of a somewhat troubled kind. There was money due that Mexico could not or would not pay, and there were thieves or marauders whom Mexico could not or would not catch. The Government of the United States declined to recognize the Government of General PORFIRIO DIAZ. It could not deny that he was in possession of the capital, but it wanted to see whether he would stay there. Gradually, however, things have got better. Tranquillity, as the word is understood in Mexico, was established. Mexico paid up as well as it could; marauders were chased in the border districts with an activity sufficient to enable the American Government to say it was satisfied; and the Government of General DIAZ was recognized. Mr. FOSTER, the American Minister at Mexico, who is an exceptionally able, courteous, and vigorous representative of American diplomacy, has recently made a long tour through the central and northern States of the Mexican Federation, and has not only been cordially received at every point where he stopped, but has done much to familiarize the Mexican mind with the notion that the Americans are not plotters and robbers, and the American mind with the notion that Mexico presents a field in which money may be made. General GRANT may therefore be said to be paying his visit at a propitious time. General DIAZ is now in the fourth year of his Presidency, and he has been a very good President. He fought his way to power after the usual Mexican fashion, following and setting a bad example, and the country had to pay the inevitable cost of the needy followers of a successful General getting hold of such good things as are to be had in Mexico. But the General himself, having the confidence of the army, and managing to keep his army from the disaffection which an army naturally feels when it is left to starve, and not shrinking from severities which were perhaps more necessary than constitutional, set up a reign of something like order. He has, too, a very strong and a very honest wish to see the country making some advance towards the prosperity for which nature has fitted it. He quite understands that the basis of prosperity for Mexico must be the introduction of foreign capital, and he not only receives foreigners with frank courtesy, but listens patiently to their proposals and strives to do justice to their claims. Unfortunately, as he chose some time ago to pass a self-denying ordinance by which the President for the time being is incapable of re-election, his term of office must close at the end of the present year. After some years of difficulty and strife, he has worked the country into a very tolerable state; but his labours have a limit, and next autumn Mexico must pass through that form of chaos which is known as a presidential election.

If Mexico could but have ten years without a revolution, it would unquestionably go forward as much as General DIAZ or any of its most ardent friends could wish, or at least as much as they could reasonably expect. Even with all its recent revolutions, the country is advancing. Mexico city especially has greatly improved. It is well policed, it is lit with gas, and is full of thriving shops, where articles of luxury are sold at prices which show that purchasers must have a considerable amount of ready money in their pockets. Recently the capital has been cheered by the arrival of a Belgian, a German, and an Italian Minister, and the chief difficulty of the new Ministers is to find houses suitable to their dignity. There are many handsome houses in Mexico, but their present occupants can afford to live in them. Outside the city there may be noticed, at least here and there, signs of reviving wealth. The railway from Vera Cruz to the city of Mexico is not only a standing monument of the skill of engineers, the enterprise of capitalists, and the excellence of administrators, but has made an important district moderately safe, and has awakened into something like activity every tiny centre of population through which it passes. In some suitable parts of the country energy and money are being applied to the cultivation of coffee; a new and flourishing industry has been started in the manufacture of hemp from the cactus; and if agriculture has not improved, there are at any rate Mexicans who are thinking how it can be improved. More than all, the humblest Indians are beginning to have wants. They are fluttered with those first feelings of discontent with abject squalor which are the germs of all national improvement. Popular education, too, has made a progress surprising in a country so backward, and it scarcely seems extravagant to hope that before long every brigand may be able to read the letters of the traveller whom he despoils. But it must be understood that, apart from political causes of confusion, Mexico is not a country which can advance very rapidly. It has great mineral wealth; but its accessible mines are not rich, and its rich mines are not accessible. A large portion of the land, through defects of soil or climate, is not worth cultivating, and that which is worth cultivating is held in a manner which may safely be described as the worst manner in which land can be held. It is held in large tracts by owners who have mortgaged it for all they can borrow on it, and whose sole idea of happiness is to devote the little that remains to the dismal gaieties of a Mexican town. In Mexico there is no place for immigrants. There is no vacant land for them, and there are too many chances of being shot, and too great a certainty of being hated and thwarted during a precarious life, to induce any one to go to Mexico while Canada and the United States are open to him. It is a mere delusion to suppose that Mexico will rapidly become a great exporting country. What may happen to it, and what, if favourable circumstances permit, will happen to it, is that

the Mexicans, left substantially to themselves, will begin to make money and will learn to wish to make more.

But when we speak of what Mexico might be without revolutions, we know that we are speaking of that which is not probable. The causes of the periodical occurrence of revolutions lie deep in the character and the social condition of the people. Among the mass of those who take part in a revolution, the struggle is simply a scramble for plunder. A successful revolution is always a profitable piece of business, and often it is an easy piece of business. After some preliminary skirmishing in earnest, an arrangement is not unfrequently come to as to which party is to be considered to have won, and a mock battle ratifies the compact of the leaders. Every four years there is a fair occasion for scrambling, as a President is to be elected. The nominal voters may be left entirely out of account. The President is elected by the Congress; but the Congress is elected through the machinery of a popular vote by the Governors of the several States. If the Governors would agree to name the same person, or the minority would be bound by the majority, and if no formidable outsider was prepared to assert a claim to intervene on the ground, indisputable in fact and important in theory, that the election was not a real election, things might go on smoothly. But the chances are that at each crisis conditions so unlikely to be fulfilled will not be fulfilled. It is therefore highly improbable that the era of Mexican revolutions has closed. But it is not impossible that they may become milder and shorter, and that gradually the obstacles to revolutions may become more effectual and the disposition to indulge in them weaker. The most powerful instrument in the control or suppression of revolutions will probably be found in the extension of the means of communication through the country. Not only will there be an increase of prosperity, and, with prosperity, a greater distaste for disorder, but the central Government will be much more powerful, and will be able to act with greater promptitude; while there will be fewer of those isolated districts which, simply because they are isolated, become the hotbeds of revolution. Without railways Mexico can make no real advance towards either prosperity or tranquillity. The Mexicans themselves cannot make their railways, and the whole future of Mexico depends on the willingness of foreigners to make railways for a country where railways, if security for life and property could be assured, would prove satisfactorily remunerative. Fortunately there is already a disposition on the part of foreigners with sufficient capital at their command to help Mexico in this way. Two enterprises of the highest importance are now being actively carried on with American money—an interoceanic railway across the Isthmus of Tehuantepec, and a railway connecting the American border with the port of Guaymas on the Pacific. Capital from either America or Europe will also probably be soon forthcoming for the construction of lines from the city of Mexico to the interior. It remains for Mexico not to throw away the opportunities offered to it through a childish jealousy of foreigners or through the rivalry of contending cliques.

MR. BRIGHT ON IRISH LAND.

PERHAPS the most significant passage in Mr. BRIGHT's speech at Birmingham was his statement that his plan for purchasing the interests of landlords was approved by the principal Irish members. Mr. PARNELL, indeed, who is probably one of the members to whom he refers, has in his American speeches repeatedly sneered at the plan of compensating the landlords, whom, like Mr. BRIGHT, he proposes to remove from Ireland; but he and his allies will not fail to support a measure which on one side corresponds with their own professed policy. If Parliament could be persuaded to buy out the landlords, the Home Rule party would only object to payment of the purchase money. In the meantime, the foundations will have been laid of a renewed alliance with the Liberal party which may perhaps last over the general election. It is not to be supposed that Mr. BRIGHT overlooked the party advantage which might result from his indirect overtures. In other respects his Birmingham speech can scarcely be called political. With the exception of one inevitable reference to Afghanistan, Zululand, and Asia Minor, he confined himself to a scheme of legislation which in his judgment would cause great and unmixed benefit to Ireland. It would perhaps have been more convenient that he should have proposed his plan in the House of Commons, for the applause of an admiring multitude of his constituents can add nothing to his own authority; but Mr. BRIGHT probably wished to call general attention to a subject which is undoubtedly of great importance. On this as on other questions it would be impossible to accuse Mr. BRIGHT of inconsistency. He has for many years insisted on the expediency of facilitating by the aid of public funds the establishment of large numbers of small freeholders in Ireland. The BRIGHT Clauses, as they are called, in Mr. GLADSTONE's Land Bill involved a practical acceptance of his doctrine; but they have for obvious reasons operated only to a small extent. The Act provides for the advance to an occupier, who may be the highest bidder for his own farm, of a large portion of the purchase-money; but estates are seldom sold piecemeal; and the Encumbered Estates Court is of course bound to obtain the best price for the whole. If therefore the tenants only offer to buy a part of a property, the negotiation, as far as they are concerned, falls to the ground. Mr. BRIGHT mentioned at Birmingham a case in which eighty per cent. of the occupiers were willing to pay the price which was asked for their holdings; but the Court properly declined to leave the remaining fifth part on the hands of the owner. A similar provision in the Church Surplus Act has been found more effective, for the simple reason that the Church Commissioners have no private rights to protect. They have consequently power to sell any farms to the occupier, although the transfer may possibly affect the value of their remaining property.

Mr. BRIGHT proposes a remedy for the alleged imperfections of the Land Act which would probably be effectual. A Land Commission is, according to his plan, to be constituted, with power to buy in the first instance any estates which may be voluntarily offered for sale. Compulsion is to be applied only in the case of the London Companies, although there is no reason to suppose that their property is badly administered or that their tenants specially need protection. Private landowners are to retain their estates as long as they think fit; and it would appear that, even if they wish to sell, the Commissioners are to have no right of pre-emption. Having acquired land by voluntary contract, the Commissioners are to sell it to the occupiers, either for cash, if they have the means of paying, or by imposing a rent-charge which will in a certain number of years cover both principal and interest. Mr. BRIGHT professes to believe that the annual payment would in many, perhaps in most, cases not exceed the present rent. The occupier would, as soon as the bargain was completed, become owner in fee, subject until the expiration of the term to a defeasance on default of the annual payment. The possibility and the probable consequences of the ejectment of defaulters were, as was natural, lightly passed over. Perhaps the Government, or the Commission by which it would be represented, might be better able than existing landlords to deal with contumacious debtors who might be disposed "to "hold a firm grip of the land." It is also possible that public or agrarian opinion might be more favourable to the performance of a contract to buy than of a contract to hire. There is some force in Mr. BRIGHT's contention that, if there is to be fixity of tenure, it may advantageously take the form of freehold possession. It is, as he says, difficult to assess a fair rent by any process except voluntary agreement. Another objection to the conversion of a landlord into an annuitant is that, if Mr. PARNELL's doctrines at any time prevailed, the annuity would not be paid. When tenants are exhorted to determine for themselves what they can afford to pay, and to pay nothing more, it matters little whether the agreed rent is excessive or fair. Fixity of tenure would, as Mr. BRIGHT suggests, convert into absentees the landlords who at present reside. No man in his senses would live by choice in an Irish rural district as an idler without powers, duties, or rights, except the right to a rent which he could receive as conveniently elsewhere, if he received it at all.

Mr. BRIGHT's characteristic inability to change his opinions or customary statements was illustrated by his tacit assumption that the Land Act had been wholly inoperative. He spoke of the Irish occupiers as tenants at will, always in danger of eviction, and liable to a constant increase of rent. He might have remembered that they are entitled to compensation for disturbance, by virtue of

a measure which created an entirely new precedent for interference with the rights of property. Evictions, except for non-payment of rent, are now extremely rare, and a demand for increased rent is subject to the decision of a judicial tribunal. In times of distress the majority of landlords, including nearly all the great owners, make liberal reductions of rent. Whether a Commission, entitled during a term of years to an equal or larger annual payment, could be equally accommodating, may reasonably be questioned. If Mr. BRIGHT's plan at any future time becomes law, the conditions on which large sums of money can safely be advanced must be carefully ascertained and positively fixed, and it would scarcely be practicable to complicate the calculation by an allowance for bad seasons. One of Mr. BRIGHT's statements is that tenants are unwilling to make improvements because they are liable to an increase of rent if it appears that they are thriving. He again forgets that the Land Act makes ample provision to compensate an evicted occupier for any improvements which he may have made. Mr. GLADSTONE, in fact, conferred on the tenant, at the expense of the landlord, a not inconsiderable share of the entire property. It is said with much probability that the rights given by the Act have often served as security for loans. It is highly probable that the charges of the local money-lender may have swallowed up the increased value which legislation had placed on the holdings.

Mr. BRIGHT more than once intimated his dissent from certain wild theories which were not particularly defined. He kept himself entirely clear from complicity with Mr. GLADSTONE's wild and outrageous proposition that landowners may be rightfully expropriated for the purpose of trying economical experiments at the discretion of the Legislature. Mr. PARNELL only differs from Mr. GLADSTONE in his conclusion that the time for expropriation has already arrived, for he condescends to allow an imaginary compensation to landlords from some unnamed public fund. The objections to Mr. BRIGHT's plan as compared with Mr. GLADSTONE's or Mr. PARNELL's are mainly economical or financial. They have been urged with great force by Mr. FAWCETT, to whom Mr. BRIGHT has not attempted a reply. The Treasury is, according to the project, to become the mortgagee of nearly all the land in Ireland, with claims for the regular payment of interest on 600,000 mortgagors, of whom nearly all are poor, and of whom some repudiate any debt connected with the land. It is of the essence of Mr. BRIGHT's project that the Commission, or, in other words, the State, should acquire not only farms which the occupiers are immediately ready to purchase, but the surplus lands which have hitherto principally impeded the effect of the BRIGHT clauses in the Land Act. Property not transferred to the occupiers must either be held by the Commission at its own risk or be sold to outside purchasers in a market where, under the new system, there would be little demand. In bad seasons the Commission must either proceed frequently to eviction or sustain a loss of income which would fall on the general taxpayer. Arguments of this kind may not perhaps be absolutely conclusive, but until Mr. BRIGHT can meet them he is not in a position to embody his theory in an Act of Parliament. Whether distress in Ireland might not be increased by the universal establishment of small freeholds is another serious question. It may be true that peasant proprietors flourish in many parts of the Continent; but two or three generations must elapse before the Irish cease to have large families. A great increase of population with a corresponding subdivision of the land would almost certainly produce distress and periodical famine. No provision is made for the poorest part of the population, consisting of labourers who have no farms to occupy or to buy. Improvements which require large outlay of capital would become impossible; and the only remedy for the distress which would perhaps become general would be emigration. It is true that Ireland, and Great Britain as it is connected with Ireland, are not at present on a bed of roses.

FRENCH LIBERALS AND EDUCATION.

THE French Liberals seem to have made away for the present with all the distinctive principles associated with the name they bear. In this perhaps they are not more inconsistent than the French Conservatives. A party which associates Conservatism with the overthrow of existing institutions, and the substitution of others which could probably not be set up except at the price of a civil war, has no stones to throw even at the most irrational of its opponents. The Liberals, however, have the advantage of being in power, and they are consequently able to give full effect to their political ideas. They are now chiefly occupied with educational questions of all kinds. They point with pride to the fact that as soon as a Liberal Ministry comes into office it at once sets to work to extend education in all directions. The present Government have three Bills at least on hand at the same time—two dealing with the higher education in schools and Universities, and the third dealing with education as given in primary schools. The Bill which has been under discussion for a week past in the Senate is not the one which contains the famous Seventh Clause. It deals entirely with the control of public instruction, with the extent to which this control is to be exercised, and with the composition of the body which is to exercise it. Upon the details of a measure of this kind foreigners cannot of course speak with any confidence. But upon the general question whether it is expedient that the Government shall exercise such power in educational matters as is given it by the Bill it is possible to have a confident opinion. The fault of the existing Council of Public Instruction in the eyes of the Liberals is that it is not chosen in the right way, and not possessed of sufficient authority, and the Government propose to amend it in both these particulars. If the Bill passes, every school that falls within its scope will be placed under a Council, the greater part of whose members will have been chosen by the State, instead of, as under the existing system, by various bodies more or less independent of the State. This Council will have large powers of closing schools, dismissing teachers, forbidding the use of particular books, and generally of interfering in the internal management of the school. The extent of these powers is, of course, disputed. The Liberals allege that they are only meant to be used when a teacher has clearly shown his unfitness to teach, when a school has been shown to be unmanageable, or when the teaching derived from certain books is held to be mischievous. The Conservatives say by way of answer that these powers can be perverted to any purpose which it may suit the Government of the day to entertain. They will plead unfitness to teach or inability to keep order as reasons for withdrawing the licence of a teacher or putting an end to the existence of a school, when the real offence in both cases is that the school or the teaching is Catholic. At all events, if the Council choose to take this line, it does not appear that there is any way of preventing them, and this may be considered as a sufficient condemnation of a Bill which gives this amount of power to a body entirely chosen by the Government for the time being. To the majority of the French Liberals, on the contrary, this appears to be the most natural and defensible of measures. They do not in the least mind saying that their motive for thus dealing with education is the fact that where education is of the proper kind it makes men Liberals, and that on this ground, if on no other, it is the business of Liberals to take care that it is of the right kind. Education as such has not this inevitable tendency; consequently it is not enough to promote education in a general sort of way. Quality as well as quantity must be had. If Catholic parents are suffered to provide education for their children, the State must take care that this permission is surrounded with conditions which shall make it little better than formal. That this is not a perfectly liberal way of dealing with Catholic parents never seems to strike the supporters of the Bill. They are rather disposed to regard it as a measure the propriety of which is self-evident. They have passed beyond those elementary ideas which teach Liberals to respect the right of individuals to do what they please, so far as the exercise of this right does not annoy their fellow-citizens, and have substituted a definition according to which Liberalism means the right of Liberals to make other people do what they please.

Most Englishmen will be inclined to sympathize with the Duke of BROGLIE's denunciation of this measure in the Senate. To talk of liberty of education under a system which makes the State the ultimate judge of what shall be taught and who shall teach, is to use words in a way that deprives them of all rational significance. Yet it is impossible to read the Duke of BROGLIE's speech

without remembering that for the temper of mind which has led to the creation of such a Bill he is in part responsible. The French Liberals can fairly plead that, if they regard Catholicism as incompatible with sincere allegiance to the Republic, and consequently claim the right to surround Catholic teaching of all kinds with a whole series of newly invented disabilities, it is the Duke of BROGLIE and his party that have confirmed them in the idea. It may be that, even if the Orleanists had not under his leadership gone out of their way to convince France that they were Clericals before they were Constitutionalists, the Republican party would still, under the influence of the advanced Left, have displayed the same rooted opposition to religion that now characterizes them. But, at all events, it would not have had the same apparent justification. If the Duke of BROGLIE were questioned, he would probably say that what he dislikes in the Republican Government is not the form, but the substance—not the machinery, but the article it turns out; and in theory he would say this quite truly. But in practice he showed himself animated by a much less discriminating spirit. Instead of dissociating the Republican Government from the particular Republicans who happened to be administering it, he treated the two as completely identical. The Right and the Left Centre were plainly marked out by events as the nucleus of a Conservative party which, while frankly accepting Republican institutions, should labour to inspire them with a Conservative spirit. Probably the Duke of BROGLIE had himself no rooted objection to a Republic. Unfortunately, however, he allied himself to men who were less tolerant. To what extent he was really mixed up with the Royalist intrigues which were in progress during the greater part of Marshal MACMAHON's tenure of office is a point which will only be settled when the DUKE publishes his memoirs. At all events he did enough to convince the Republican party that he was mixed up in them. The same opinion was entertained, rightly or wrongly, of Mgr. DUPANLOUP; and in this way Catholicism became identified, not with Conservative principles, but with Royalist manœuvres. There are still a few Liberals left in France who have remained true to their professions, and are prepared to concede to others what they claim for themselves. But the followers of M. DUFAURE, M. JULES SIMON, and M. LABOULAYE can almost be told on the ten fingers; and though they may accidentally be strong enough to determine the result of a close division, they are not strong enough to affect perceptibly the general current of Liberal opinion in the country. To do to your enemies that which you think they would do to you is the golden rule of French Liberalism. This is combined with a curious inability to believe that there can ever come a time when they will themselves have need of the liberty which they now refuse to others. It is of no use to point out to them that the Council of Education which they are now building up may some day become a weapon of tremendous force in the hands of their adversaries. Catholics could not desire a better Council of Education than the one which this Bill will give them if ever they regain power. It is a simple reproduction of the Government for the time being, and nothing will be needed in order to give Catholics a practical monopoly of the higher education, if not to carry out with scrupulous accuracy the plan which is now under consideration. This prospect, however, has no terror for the Liberals. They cannot persuade themselves that any possibility of reaction remains unexhausted, or that their methods of using their victory are precisely those which are most certain to breed intellectual rebellion in the next generation.

FAGGOTS AND FAGGOTS.

TO-DAY, January 31st, is a day of considerable importance in the annals of electioneering. It is the last day for the completion up to the required point of a rather remarkable structure in the neighbourhood of Edinburgh which has been irreverently denominated the "GLADSTONE Electoral Asylum." As everybody knows, Mr. GLADSTONE in his Northern tour took occasion violently to denounce the device by which his opponents had, it was said, endeavoured to make good their position. A certain portion of his followers followed him in this respect also; but among the Midlothian Liberals were to be found more practical spirits than these. There is, indeed, no reason to think that the promoters of the building which (if their calculations have not failed) ought to come into legal existence to-day abstained from denouncing the faggoteers of Dalkeith. They are doubtless of the same opinion as the celebrated Mr. BAXTER. It is said that a friend visiting BAXTER at the time of the Toleration Act found him in great depression, not to say indignation, on the subject; and knowing that he himself had suffered not a little from the want of toleration, ventured to express surprise. "Yes," said the aged saint, "but I was in the right, and most of those who will profit "by this are in the wrong." As this great Nonconformist viewed toleration, so do some at least of the Midlothian Liberals regard faggots. Employed for the purpose of seating Lord DALKEITH they are an abomination; employed for the purpose of seating Mr. GLADSTONE they are lawful and expedient.

There was, however, not a little ingenuity in the variation with which the art of manufacturing voters has now been applied. It struck some inventive politician that building clubs were at the moment popular in Edinburgh, and that there was colour for the erection of a house or lodging hired or bought of a building Society, even if not fully paid for, into an electoral qualification. Accordingly, no sooner was Mr. GLADSTONE's back turned than they set to work. A site was obtained just outside the City boundary, large premiums were offered to contractors, and a vast body of men were set to work night and day to dig the foundations and, as the phrase is, "rush up" the buildings. These consist, we are told, of some eight or ten sets of houses, arranged in flats, sixteen to the house, and to be paid for in a series of years by the occupants. It is comforting to those who have a fellow-feeling for human misery, and who do not wish even faggoteers to expire of rheumatic fever, to learn that it is not intended that these devoted admirers of Mr. GLADSTONE shall go into residence at once. It is supposed to be sufficient that their abodes shall have to-day—the last day for entry on the valuation roll of the year—attained a certain nominal value, and occupation may be postponed to the more usual, and perhaps more genial, season of Whitsuntide. The erection of the dwellings, as at least by courtesy they must be called, appears, from the notices which have from time to time appeared in the Edinburgh papers, and which have sometimes filtered southwards, to have been attended with a good deal of amusement. Enthusiastic Liberals have walked out on the Dalry Road, and encouraged the workmen by cheering for Mr. GLADSTONE—an interesting display of feeling which rather reminds one of the manners of the stage than of those of real life. On the other hand, the opposite party have been by no means shy of frequenting the same spot. They have pointed out the immediate neighbourhood of a sewage farm, we are told, and other constituents, of what they call in Scotland the amenity of the situation. They have also suggested, and certain recent accidents in London must have been a godsend to them, that other things besides rockets can sometimes come down almost as quickly as they go up. Certainly building operations during which at least two unusually severe frosts have occurred may be regarded with some little suspicion. It can hardly be doubted, too, that unless the Tory lawyers of Edinburgh have singularly lost their cunning, a considerable fight will be made over the qualification, if the houses are not actually fit for habitation at the present moment. We are told, indeed, that many more than the requisite number of occupiers have presented themselves for these in some respects scarcely inviting tenements. There is nothing at all surprising in this, for it is not uncharitable to suppose that the attractions of the "Asylum" are at least not below the value at which their promoters put them. Great pennyworths are generally to be secured more easily at election times than at any others; and, after all, it is fair that an enthusiast should sit at an easy rent when he faces the inconveniences and possible dangers of residences run up in the very depth of winter and in rather less time than would usually be taken in the marking out and digging of their foundations. Meanwhile it is not to be supposed that the agents on the other side are idle. The new valuation roll is as much open to them as it is to their opponents, and as it was last year. It may reasonably be assumed that not a few rent-charges, joint-ownerships, and other devices for the multiplication of votes, have been created to neutralize the threatened contingent from the "Asylum," and thus in all probability the proceeding will leave parties very

much as they were. While, however, it may have no great effect on this particular contest, it can hardly fail to have some little influence as a *reductio ad absurdum* of the system of faggot-voting. As a mere argument to prove that both parties are tarred with the same brush, it is of no great importance, because it is not wanted. It is a notorious fact that never was faggoteering employed on such a scale as by the Liberal party in the days of the Anti-Corn-Law agitation; and it has been asserted without contradiction that the manufacture of qualifications has been for some time going on merrily in certain Northern English counties, which are to be assaulted at the next election by Liberals. There is, therefore, no reason why both parties should not look at the matter on its merits; or rather there would have been no reason had it not been for Mr. GLADSTONE's attack on it.

It is perhaps hardly necessary to say that we are here treating only of what may be called *bonâ fide* faggots, not of fictitious qualifications. The distinction is sometimes ignored, but it is a sufficiently sharp one. For a faggot vote some real consideration must be given, though it is to be assumed that the vote, and not the value received for the consideration, is the object. Votes of this sort are of course perfectly in accordance with the letter of the law, and perhaps as perfectly in opposition to its spirit. They have always been more common in Scotland than in England, partly because of the greater ease with which, under the more feudal conditions of Scotch law and custom, they can be fabricated; partly because of the tempting manner in which Edinburgh is surrounded by a number of small county constituencies; most of all perhaps because, the number of electors being usually smaller in Scotland, a few votes are of more importance there. A brisk politician can do a good day's work for his party in the Lothians, Selkirkshire, Roxburghshire, and so forth, between breakfast and dinner. Now we are not prepared to say that the purchase and exercise of a faggot vote, when it is dictated by actual personal zeal for a cause or party, is a crime. On the contrary, as the sign of an active interest in the fortunes of the country, it may be said to be evidence of a failing which leans rather to the side of virtue. But the recent proceedings in Midlothian show in practice—it has always been evident enough in theory—to what the system amounts. Should this "Asylum" attempt succeed, active electioneering agents have a glorious future before them. The older plan of faggoting had certain disadvantages. It could not be dishonestly carried out without conduct unpleasant to men of honour, and it could not be honestly carried out without entangling the freeholds of the chief proprietors in a manner which even an ardent politician might be inclined hardly to relish. The new plan is free from all these difficulties. All large towns have a disposition to overflow into the adjoining counties, and the centrifugal tendency of those voters who inhabit houses of the lowest electoral value is particularly marked. Modern building is very rapid, and there is generally plenty of capital available for operations which combine the advantages of a tolerably safe and good investment with a certain electoral gain. There are plenty of towns in England where it would be perfectly practicable to throw a solid body of some thousand voters into a neighbouring county in this way. It is true that the Ballot interposes some difficulty in the way of keeping the voters "straight"; but, as in the great majority of cases the houses would be made cheap and attractive, and the payments would be spread over a great number of years, self-interest might be trusted to make tenants steady, at any rate at the particular election in view of which the faggots were created. Elections would in this way become a mere farce, and the result would depend on the longest purse and the adroitest management as directly as in the days of open bribery. Of course to the eye of strict justice there is nothing more immoral or improper in creating 160 votes in a batch than in creating them singly. The result is, however, more startling to the general eye, and therefore likely to have more effect on the general mind. There is no need to credit the promoters of the "Asylum" with the long-sighted design of making faggoting impossible in the near future; but it is more than probable that their smartness, whether it succeed or not in its immediate object, may have that effect.

CHAIRMANSHIP OF THE LONDON SCHOOL BOARD.

THE two sides that are proverbially represented in most controversies are not wanting in the movement which has lately been set on foot for giving the Chairman of the London School Board a salary. The question has been raised by the presentation of a memorial setting forth the growing work of the Board and the consequent importance of its commanding the entire services of its Chairman. It is further stated that he would thus be enabled to exercise a more efficient control over the expenditure and work of the Board, and, by way of conclusion, that the position of the Board demands that it should be placed on a similar footing to that of the Metropolitan Board of Works. This last argument does not impress us as very weighty. If the London School Board is not already respectable enough to stand comparison with the Metropolitan Board of Works, it is not clear how it is to become so by the mere fact that it devotes 2,000*l.* a year out of the rates to the payment of its Chairman. Sir CHARLES REED will be Sir CHARLES REED still, whether he is paid or unpaid; and though we should shrink from a task so invidious as that of comparing him with Sir JAMES HOGG, we should be no more ready to do so than we are if he drew an official income of the same amount. It is certainly due to the position of the School Board that its Chairman should not be without a decent coat to his back, and that his shoes should uniformly be good enough to resist bad weather; but, supposing these essentials to be provided from other sources, that mysterious debt to the position of the Board seems to be discharged. The plea that if the Chairman had a salary he would be able to exercise a more efficient control over expenditure seems to be founded on a mistaken estimate of what it is that leads to expenditure. If a good deal of money simply slipped through the fingers of the Board, stricter supervision on the part of the Chairman might avail to check the stream. But, in so far as the London School Board is costly to the ratepayers, it is costly by design and policy, not by carelessness. If it wasted pence a Chairman always on the watch to see that none rolled on the floor might be of some use. But, if it wastes at all, it wastes pounds, and the Chairman might be at the office for six hours on six days in the week and yet not be able to prevent this. He could only make the intentions of the Board economical by influencing their votes, and if the Board wish to save money, they can prove their desire by their votes with or without a Chairman.

There remains, therefore, the argument that, if the Board had the entire services of their Chairman, he would be able to exercise more efficient control over their general work. Undoubtedly there is force in this reasoning. A permanent Chairman is almost essential to the efficiency of any committee, and it is contended that if he were paid this advantage would be reaped to a much larger extent. If the public pay for fixed and constant service, they have a right to see that they have it; but the knowledge that service is gratuitous forces them to put up with whatever they can get. You cannot look a gift chairman in the mouth any more than a gift horse. It is further insisted that the range of choice would be wider. The Board are not obliged to choose their Chairman from among themselves. They may elect any one they like, and if they have a salary to offer, they might hope to command the services of many capable men outside who could not give the necessary time to the work if they had to make their living in some other way at the same time.

To this it may be answered, first, that much of the gain that is anticipated from the appointment of a paid Chairman has already been realized by other means. The Board has an exceedingly able Secretary in Mr. CROAD, to whom it pays 1,200*l.* a year. When the duties and pay of this official were settled, it was with the knowledge that he would be required to supply that element of continuous supervision which must be given by some one, but may be given indifferently either by a Chairman or a Secretary. It is not alleged that this arrangement has broken down, that Mr. CROAD has proved incompetent to do the work assigned to him, or that any new work has been discovered which does not fall within the province of a Secretary. It is highly improbable that the efficiency of the Board would be promoted by the retirement of Mr. CROAD; and if the Chairman as well as the Secretary are highly paid officials, the salary of the former is a clear addition to the expenditure, without, so far as is

shown, any corresponding addition to value received. The public would not be paying for fixed and constant service which they now do not get and then would get. They would be paying 2,000l. a year more than at present for fixed and constant service which they already to a large extent possess, although in a different form. As regards the alleged extension of the range of choice, it is not at all certain that any such extension would be secured, or indeed that it is required. As a rule, it is more reasonable that the Board should choose its Chairman from among its own members; and if a large salary were attached to the office, it would be more than ever unlikely that the members should agree to pass a self-denying ordinance. If it be an advantage that the Chairman should be taken from outside, the Board will be at least as ready to give the public this advantage if the honour which they forego for themselves is of no money value. Nor in the case of the London School Board is there the slightest danger that the office would go begging because no salary was attached to it. India, the public service, and political life supply a constant succession of men of greater or less eminence who from one cause or another have their time very much on their hands, and are only anxious to find employment for it which they can at least persuade themselves is useful. The reason which prevents more men of this class from coming forward as candidates for membership of the Board is not their inability to give their labour for nothing, but their dislike to the cost and burden of the election. There can be little doubt that at this moment the Board might command the exclusive services of half-a-dozen very proper Chairmen if it were announced that Sir CHARLES REED had resigned, and that his successor would not be a member of the Board.

In spite, therefore, of the many distinguished names which appear at the end of the memorial, the resolution ultimately come to by the Board seems a sound one. It is "inexpedient that the Board should entertain the prayer "of the memorial" until some evidence has been shown that the present distribution of the work between the Chairman and the Secretary needs to be revised, or that the Board is unable to find a competent Chairman unless it is prepared to pay him. In point of fact, the movement seems to have been begun at the wrong end. The Board are the persons who would suffer most directly and immediately by the want of paid chairmanship; and, if the Board had applied to the Education Department, or to Parliament, for leave to provide a salary, nothing could have been more natural. They might or might not have been able to make good their point; but no one could have disputed their right to raise it. In the present case, however, we have the general public—which, so long as the work of the Board is properly done, has no special interest in the machinery by which it is done—coming forward to move the Board to make, for its own interest, a change the convenience of which has never suggested itself to the persons most immediately concerned. If the Board had plainly broken down under its work, it would be a different matter. But, so long as it is not alleged that the system of unpaid chairmanship has proved inadequate to the demands made on it, there seems to be no need to urge the Board to replace it by a system of which nothing is certainly known except that it would increase the expenses of elementary education in London by an appreciable, if small, amount.

CORNER MEN.

A SENTENCE passed this week by Lord Justice BRETT at the Manchester Assizes recalls a state of things which it was hoped had altogether passed away. In the early days of the present Government, before there was an Eastern question or a foreign policy, much used to be heard about the terror in which Liverpool and other Northern towns were kept by a type of ruffian scarcely to be found elsewhere. The "corner man" seemed to be superior to the personal motives which ordinarily lead to the commission of violent assaults. He seldom rifled his victim's pockets; or, if he did, it was rather for the sake of the violence which accompanied the robbery than from any sordid love of gain. Nor did he often cherish any personal grudge against him. The name which the class had earned for itself exactly expressed its peculiar tastes. The corner man was undiscriminating in his assaults. He took people as they came. The more unoffending the passer-by, the more pleasure he felt in knocking him down and kicking him. Some five or six years ago these cases became either more frequent or more brutal, and for a time there was a genuine desire to make an end of them. Unfortunately the public got hold of a wrong notion as to the proper method of dealing with them. It was assumed, without much inquiry, that what was needed was a change in the kind of punishment dealt out to the offenders. This was a natural supposition, in so far that it was only reasonable to take for granted that all that the existing law could do to suppress crimes of this sort had already been tried. Accordingly, most of the discussions provoked by the panic went on the theory that penal servitude had been tried, and had been found to have no terrors; and the substitute commonly demanded was flogging. The mere mention of the lash being enough to madden a certain sect of philanthropists, the controversy soon degenerated into a wrangle as to whether a man whose ordinary amusement consisted in kicking a stranger who had done him no harm until there was only just enough life left in him to secure the assailant against a charge of murder would or not be brutalized by a dozen strokes of the cat. Long before this unprofitable discussion had ended people had got tired of the whole question; and the corner men, either from a desire that their calling should not occupy too large a space in the public imagination, or because some of their number got exceptionally heavy sentences, became more moderate in their pursuit of pleasure, and for a time withdrew themselves from view. The trial which has suggested this retrospect seems to show that this retirement has not been complete. If no one becomes bad all at once, it is plain that the two men who were sentenced by Lord Justice BRETT to twenty years' penal servitude are not novices in the art. Had they been so, they would have been content with a single achievement in a single night. Instead of this, they knocked down and kicked into insensibility three men in the space of about two hours. In each case the assault was perfectly unprovoked. The prisoners had no grudge to avenge, no gain to come by. The sole reason they had for kicking any one of the three men was that he was there to be kicked. They were corner men, and they simply did as corner men are wont to do.

When this question was last under discussion, it was pointed out by several of the judges that the reason why these crimes were committed lay presumably not in the nature of the punishment, but in its uncertainty. In cases of murder, the criminal has two chances of escape. He may never be identified, or the evidence may be insufficient to convict him. In cases of assault, though the injury inflicted and consequently the pleasure felt by the injurer is little less than in cases of murder, a third and more encouraging chance is added. He may be identified, and the evidence may be sufficient to convict him, and yet he may get off with a few months' imprisonment. The cause of this difference is the disposition of magistrates to deal summarily with offences which it was never intended should be treated in this way. The law gives them the option of sending men accused of aggravated assault for trial, or sentencing them to a term of imprisonment somewhat longer than that with which lesser assaults are punished. It is probable that the intention of the Legislature was that this liberty of dealing with the case themselves should be used where the offence, though technically amounting to an aggravated assault, is, in fact, of a less serious character. The magistrates have for the most part interpreted the Act in a much wider sense. They have even invented a formula which they seem to regard as justifying them in dealing summarily with an assault of more than common brutality. They say that the offender richly deserves to be committed for trial, and that they have a great mind to give him his deserts. Having thus satisfied their consciences, they proceed as usual to pass an immediate, and therefore a light, sentence on him. He goes away to prison for six months, probably observing with great truth, as he leaves the court, that he could do that on his head; and at the end of that time he comes out the same man as he went in, except that enforced abstinence has made him healthier. There is no inducement in all this not to resume his old calling. He has not had time to forget its delights, and his old comrades are probably still engaged in it. The result is that he remains a corner man to the end of the chapter, and, if

he is lucky, never comes to any more harm than on the occasion when he was first arrested.

In the present instance, happily for the inhabitants of Ashton-under-Lyne, the corner men flew at higher game than ordinary. If they had assaulted a man of their own class, they might very possibly have now been resting from their labours in the county gaol, with the prospect of coming out again into the pleasant air in the long days and genial weather of July. Instead of this, they kicked a solicitor. The indignation of the magistrates was roused; the case was sent for trial at the assizes; and, instead of the ill-placed benevolence of a Justice of the Peace, the corner men were confronted by the wise severity of Lord Justice BRETT. There can be little question that, if it became universally known that assaults of this kind were invariably sent for trial, and that the sentence in case of conviction was invariably a long term of penal servitude, the trade of corner man would rapidly become unpopular. Revenge is sweet, and gain is sweet, and men will risk or defy penal servitude, as they will risk or defy death itself, in order to gratify their love of either. But it is highly improbable that they will defy penal servitude in order to enjoy the pleasure of half murdering a stranger against whom they bear no malice, and from whom they expect to gain nothing. The crime has its origin, no doubt, in a mere brutalized love of inflicting pain. But this passion would be kept within bounds if the gratification of it inevitably carried with it twenty years of penal servitude. The two requisites for the complete suppression of crimes of this character are certainty and severity of punishment. To secure the first rests with the magistrates; they must always send such cases for trial. To secure the second rests with the judges; they must always visit the offence, in the case of conviction, with a very heavy penalty. If either magistrates or judges are found to disregard their plain duty in these respects, they ought to be brought to a wiser mind by some restriction of the discretion which the law now gives them.

WHAT IS A JINGO?

IT cannot escape the notice of those who have observed the course of public affairs in England and in Europe generally during the last few years, that new forces are at work which tend to the disintegration of the orthodox political parties. Forty years ago the distinction between Liberal and Conservative in England was broad, well defined, and pregnant with meaning; while Continental Liberals were content in general to take their cue from England. Abroad the old Liberalism of the English type is now at a discount. In Germany Parliament obeys willingly one man in whom it has confidence. In the works of one of the ablest political writers whom Germany possesses—Professor Heinrich von Treitschke—the development of a Parliamentary Liberal after the English fashion into (to call a new thing by a new name) a sort of Liberal Absolutist may be traced by any reader. In Italy the mass of political men appear to be absolutely without any compass to guide them, and Parliamentary parties are in a state of confusion so inextricable, and of paralysis so complete, that there seems at times no way of restoration except by means which it is not pleasant to discuss. Even in France, where Parliamentary government as a reality, and not merely as a misleading name for Parliamentary publicity, seems to have the best chance on the Continent, the type of Liberal has wholly changed since the days of the July Monarchy. In England many persons cannot but feel that, if foreign affairs were put out of the question, and if the British Empire were a matter of past history, there is no particular reason why the moderate men on the two sides of the House of Commons should not change places. The Tory of the old school reposes with other historical fossils; the Radical of the new school is as alien from the moderate Liberal as he is from the moderate Conservative. The moderate Liberal does not in his heart wish to see the Church of England disestablished, or to do more on the question of the land than remove the artificial restrictions which prevent its freer circulation; though what he may consent to do rather than sacrifice the Radical and Nonconformist alliance is another matter. People are now asking themselves afresh the question, What are the genuine, living forces now opposed to one another in the country, the forces of which parties should be always the expression, and by which parties are in the long run compelled to shape themselves?

In home affairs the problem is more complicated and obscure; but it is a right instinct which has led the two parties to stake their fortunes at the next election on the foreign policy of the Government. Taking each as a whole, the foreign policy of the last three years and that of Mr. Gladstone's Administration are different in their aim, their spirit, their method, and their result. This is felt and admitted on both sides; and the country will before long be called on to say which it likes best. It can only make a rough estimate whichever way it answers; but there are persons whom a rough estimate does not satisfy, and who want to get a clear sight of the principles at work on both sides. They want to study a little more fully, not only those poor interpreters, the avowed doctrines of the two parties, but their temper, their mental attitude, their bearing, their history, their general disposition and character. They want, above all, to find out what are the influences likely to tell in the future, and how far it is possible to discriminate and measure them. To gain these ends they will do their best to clear their minds of prejudice, and they will assiduously frequent the society and listen to the conversation of men of all parties, from the Radical who thinks the British Empire a misfortune which cannot too soon be mended, to the firmest believer in the imperial destiny of this country.

Chance has given currency to a word which possibly may one day become as widely known and as respectable as the name of Whig or Tory—the word "Jingo." An English traveller abroad is said to have been not long ago asked the question by a Continental politician, "Mais, qu'est-ce que c'est donc, monsieur, que ce Jingo?" His own ideas on the matter not being very clearly defined, he made answer, with delusive playfulness, that it was Mr. Gladstone's familiar spirit. The epithet is now used by Liberal speakers, even by the most moderate and eminent of them, as a convenient missile to fling at their opponents, and by Radicals it is applied freely, and one may say indiscriminately, to all who desire to maintain the honour and integrity of the British Empire. A word which the political excitement of the last three years has engraved so deeply in people's memories, and which the excitement of the next elections will perhaps fix there still more firmly, cannot be soon forgotten; and even if it does not attain hereafter to the classic dignity of the two names cited above, its place in history is already won. But then what is a Jingo exactly? Is it a man who believes in what Lord Derby calls "gunpowder and glory," whatever this may mean? Is it a man who wants to fight everybody all round, if such a man there be? If we turn to that celebrated refrain which has given currency to the word, and which will be remembered longer than many verses of greater lyrical value, we can find nothing more in it than the expression of a modest firmness and self-reliance. It breathes defence, not defiance. It affirms that we have no desire for war, but that, should war arise, we have the means to face it. This temperate affirmation is clenched with an oath, reprehensible indeed, and by no means refined, but far less objectionable than many other such words that we unfortunately hear even from the Liberal workingman as we walk along the streets. Since there is nothing in the origin of the word, as a political term, which explains the use made of it, and since philology has no key by which to unlock its significance, where are we to turn for an explanation? We shall find a clue in the policy and temper of the men who use it as a term of reproach.

Bearing this in mind, we see that Jingoism comes to pretty much the same thing as another word also used by the same sort of people as a term of reproach—namely, "Imperialism." And this again is a word which can have all sorts of meanings given to it. It may mean a policy which rests on the mere lust of conquest, and which wantonly crushes the free development of other peoples, or a policy which rests on the fact that some nations or races are too young, and some too old, to dispense, without loss to themselves, of the government or guidance or protection of others more fortunately situated. The latter policy may be as wise and beneficent as the former is criminal and destructive. Juggling with words of several meanings is a favourite trick of demagogues. They know that the wits of a popular audience are not sharp enough to detect sleight-of-hand. The believer in the one sort of Imperialism can always be charged with the sins of the other, and the wars which the maintenance of every Empire or State from time to time renders necessary form the peg on which the accusation can be hung. The reproach, however, which may attach to the word Jingo has not deterred many persons from adopting, and even from glorying in it. Such persons are much more numerous than might be supposed, and the Imperial policy which they support is not the result of any explosion of feeling, but has been carefully thought out and adopted after mature deliberation. Their opinions may have the same interest to those who think them most foolish and wicked which the sentiments and reasonings of Nonconformists have to those who uphold the Church of England. Their policy, whatever one may think of it, is a fact and a power, and therefore should neither be ignored nor misrepresented. We heard much a few years ago of the philosophical Radical—he was then a phenomenon to be studied—and if he had now as much influence in the country as the unphilosophical Radical has, we should continue to study him. On the same ground, if on no other, it is worth while to set forth, as best we may, the sentiment and policy of the Jingo, which we take to be no more than the antithesis, in foreign and Imperial matters, of the sentiment and policy of the average Radical.

The Jingo reasons as follows. "Wisely or not, we have got a world-wide empire. Perhaps it would have been more prudent if, a century or two ago, we had resisted the impulses which led us to cross the oceans. It is true that, had we done so, the United States—that ideal of the anti-Jingo—would never have been founded. It is true that India would probably have been, and would be now, either the prey to chronic anarchy or else under the rule of those to whom the justice and honesty of English administration would seem a foolish and puritanic scrupulosity. It is true that, from the mere fact of over-population, we should

long ago have been forced to keep down our numbers by cutting one another's throats. But these and other results of a stay-at-home policy are matters of speculation. The fact is that, whether wickedly, or by a blind chance, or providentially, we are now the owners of an empire to which the only parallel which can be found in history is that of Rome, and which in certain respects is an empire still more wonderful and imposing. This we consider to be an achievement of which we may fairly be proud. We know well what labour and danger and responsibility it involves; but to what end has a race been endowed with the toughness, the activity, the enterprise, and the stability which appear to characterize the English race, if it is to shrink from work which involves labour and danger and responsibility? By no act of our own, but by the working of historical laws, a great part of the human race, especially in Asia, is in such a condition that it must be either a prey to the spoiler or governed and protected by a strong Power. There is no Power on earth except England which possesses the strength and the goodwill needed to rule these nations rightly. We have no longer the choice whether to go there or not; we are there; we are pledged to govern and defend them. Those who deride an imperial policy in England show about as much sense as those who should recommend an imperial policy to Belgium or Switzerland. Such a policy is dictated by the situation in which we find ourselves, and by the duty which we owe to those millions who without us would be plunged into sufferings without measure or end. These considerations are decisive, even if conquest, if the getting of an empire, were the wicked thing which you say that it is. But this again we deny. There are just and there are unjust conquests. You Radicals are fond, when talking of Tory landowners, of saying that the soil is a natural monopoly, that no man has an absolute right to it, and that those who use it ill may fairly be made to surrender it to those who will use it well. On such grounds you yourselves demand the expulsion of the unspeakable Turk from Europe. It is only when your own country, during a Conservative administration, acts on this principle that it becomes immoral. The United States were founded and have grown through a stronger and more gifted race taking away the soil from an inferior one, and by killing off the occupiers by the sword, and, what is worse, by the brandy-bottle. Our own country became what it is through Teutonic invaders conquering and robbing, as you would call it, a Celtic population, and being in its turn conquered and robbed by Normans. It was thus that the Hebrews, Jingoes in those days to the core, won for themselves the land flowing with milk and honey; it was thus, to go back to a yet remoter time, that the Indo-Germanic race made its way to Europe; it was thus that the Roman Empire, notwithstanding the crimes which too often marked its history, secured for ages comparative order and good government throughout the greater part of the then known world; it was thus that every State now standing in the world has been built up. In denouncing as immoral the instincts that lead men to seek adventure, to brave difficulty and danger, to fight if need be, to conquer, to rule, to be honoured and followed by others, you are only saying that no nation ever became great except by immoral means, for without these instincts no nation ever did become great. Say what you will, you cannot get out of this dilemma. That race must predominate in the world which, after making provision for a vigorous national life at home, has the most surplus population, energy, enterprise, and talent to spare. If you said that we must take care to predominate to the welfare and not to the detriment of others, well and good; but you say that we should not predominate at all. You go about apologizing for the greatness of your country. When in office you made such an impression on foreign statesmen that they ignored you altogether, except on one occasion to make you pay them for allowing, through mere feebleness of will and inability to see how your acts would be regarded abroad, a ship to leave an English port to prey upon their commerce, and on another occasion to obtain the cheap renown of giving you a slap in the face. Your return to office may be the signal for a war vaster and more terrible than any which the world has seen. And for this reason. Half the Continent is only watching for a good opportunity to spring at the throat of the other. It is a matter of certainty that, should a favourable occasion arise, France and Russia will attack Germany. Against this danger the Austro-German alliance has been formed. It is very possible that Italy might be drawn into the conflict; and it is almost certain that the Eastern question would again enter into an acute stage, that the Turkish Empire would be finally broken up, and that the whole South-East of Europe and a great part of Asia would be plunged into anarchy. These are no remote dangers; already one can almost see the writing on the wall. You charge us with being indifferent to human life and human suffering. It is to save life and to prevent suffering that we wish to keep out of office men pledged to the effacement of England. We know what stuff you are made of; we know how you have acted in the past. The belief that a Liberal Administration would be neutral in a European war is a direct encouragement to intending disturbers of the peace. The belief, on the other hand, that, in the case of a war wantonly begun by any European Government, England would take an active part against the aggressors, would do more than anything else to restrain Powers which harbour aggressive intentions, and to stave off, and perhaps, through delaying it, to prevent altogether, a catastrophe which no humane and reasonable person can think of without dismay.

"We belong, where the British Empire is concerned, to no party. To maintain it intact and to prevent the seeds of its future dissolution being sown we would gladly support either party against the other. We think at the present moment that the Conservative party is more likely to do this work than you, who revile us as Jingoes, are; and therefore—reserving our opinion as to the wisdom of particular measures of policy,—we at present support the Conservative party. But there is no reason why a Liberal should not be a Jingo also; and whoever should convert the Liberal party to Jingoism would confer as great a benefit on that party as he would on the country at large. We believe we make no mistake in saying that, besides those members of the party who have openly avowed themselves in foreign affairs supporters of the Government rather than of the Opposition, there are in the Liberal ranks not a few disguised Jingoes. It may be that a Liberal Government in office would be forced by circumstances to adopt the policy which it has decried in Opposition. But it is hard to see how this could happen during the lifetime of the two men of most genius and authority in the party. As matters stand, the Jingo, if he happens to be a Liberal and has the courage of his opinions, must on foreign questions act with the Conservatives."

Some such statement as this is what a Jingo would have to make if called on to give a reason for the faith that is in him. There is much in it which the great majority of Englishmen can subscribe to without hesitation. Parts of it may appear exaggerated, the fruit of imaginative hopes and fears. What makes it desirable to state it clearly and fully is that it is held firmly by a large number of people.

THE HUMOURS OF GAMBLING.

"THERE is truth in wine," says the maxim which the wisdom of the world owes to the wit of Alcæus. It is no less certain that there is truth in the card-table, or in the wheel of roulette, or rather that these things are touchstones of the character of men or women. Fortunately, or unfortunately, it is no longer easy to watch people as they frankly display their natures and tempers, their courage and cowardice, under the stress of good or bad fortune. Once every gentleman's house had these touchstones;' the table for ombre, or quadrille, or whist, or (when cards were under the ban of law) the E. O. table, where a game was played which needs some explanation. A circular table was divided by rays which spread from a small circle in the centre. Each division was marked with the letters E and O alternately. The gamblers placed their stakes in these divisions, a little totem was spun in the middle of the board, ran out, and fell either into a division marked O or marked E. The bank paid people who had staked on the lucky letter, and raked in the gold of the unfortunates who had backed the wrong vowel. The simple nature of this sport proves how keen our ancestors were in the pursuit of these significant pleasures which we now neglect. The moral Teuton has shut up the palaces of Truth at Baden and Homburg, and it is only the austere Prince of Monaco who allows the heirs of M. Blanc to try the character of visitors from all parts of the world. Here Japanese, Russians, Spaniards, English, French, and Americans still display the seamy sides of their nature to public inspection. In the rooms at Monte Carlo, in an air not wholly fresh or pure, the consumptive patients of Mentone and Cannes pass feverish hours. Round Monte Carlo quite a legend of gamblers' adventures have grown, and the people tell a hundred anecdotes of good and bad luck, of failure and success, of croupiers, and the thieves who pick up orphan and neglected stakes, and who are called *les St. Vincent de Paul*.

The Riviera is a kind of hothouse of the gambling passion, which flourishes among rich and idle people, as the palms and the lemon-trees flourish in the southern sun. The sight of all the gold and banknotes, scattered as profusely as if they were mere theatrical properties, on the tables of Monte Carlo, fosters rapacity and greed. This, at least, is the ordinary moralist's view of the matter. Yet it is noticeable that people who are not at all avaricious are often unable to resist the temptation to play. That temptation really appeals to men's vanity. They believe in their own luck, and are eager to throw a main with Dame Fortune. Many tales are always being told at Monte Carlo about her caprices. Six years ago, for example, a young man went up to one of the roulette-tables as soon as it opened, and placed nine napoleons (the maximum) on number 13, with as many other coins as the rules permit *en cheval*, or on the sides of the square which encloses the number. For three consecutive times 13 came up, and the fortunate youth informed the company that he had fallen asleep at Ventimiglia, (where the Italian Custom-house examines luggage), had dreamed of 13, and had returned to back his fortune.

This story gives an example of a characteristic which exists in most human hearts, and which *roulette* brings to the surface. We are all fetichists at the bottom, and are influenced by purely irrational superstitions. Thus one man will persist in backing the number of the ticket which he receives for his umbrella; another notices the number of the garden-seat on which he sits beside the Mediterranean; a third has in a pocket a little piece of the rope with which some suicide hanged himself. Others have odd ways of staking their money. A man will lay down a bank-note on blank at *Trente et Quarante*, and then rush to the end of the room that he may not hear the words of doom pronounced by the croupier. At *Trente et Quarante* these words are exciting enough.

As most people know, the croupier deals out one row of cards for *rouge*, and stops as soon as he has passed thirty-one; and another row of cards is dealt for *noire* in the same way. The row which reaches thirty-one by the lower number of points is the winner. It is on record that *rouge* once made thirty-two, an extremely good point; that twenty-four had been dealt for *noire*, and that then seven aces in succession were laid down, making *noire* the gainer with thirty-one. The disappointment of the backers of *rouge* may be imagined. It is odd that, among all the desperate people who shoot themselves at Monte Carlo, not one has spared a bullet for the croupier who deals out destiny. Very lately some traveller chanced to knock at the door of a lonely American shanty. No one answering, the traveller entered. He saw a dead man sitting at a card-table, with the blue mark of a bullet-wound in his forehead. The murder was easily explained. The dead man held four aces in his stiffened hand. Opposite him on the rough log-table lay four kings, with which his opponent had hoped to win, and, being met with four aces, had taken a hasty revenge. Now confirmed gamblers believe religiously in the good and bad effect which certain croupiers exercise on their fortunes. One croupier always deals in such a way that there are no regular "runs" or *séries*, not even a run of alternate blacks and reds. Another is a more fortunate croupier; when his hand is in, "runs" are not infrequent. As the dream of the gambler is to back a run and see his capital doubled at every *coup*, this croupier's luck is eagerly followed, and he receives elegant presents of cigars and champagne. It is unnecessary to add that these observances are as purely superstitious as the red man's dance round his red cedar-tree. Croupiers know the value of their place too well to try the trick of substituting arranged packs of cards for those of the *direction*, and theories of their luck are wholly fantastic.

Croupiers do not seem more interesting than bank clerks to the world at large; but their ways and their society have a kind of fascination for confirmed gamblers. They know many stories of Fortune's freakishness—for example, of the curious absence of the number 17 at Homburg, which ruined the half of gambling Europe. For ten days, at a certain roulette table, 17 never came up, never took its turn with its thirty-five brethren. The strange news was telegraphed to Baden Baden and Ems, and the public crowded to Homburg to back 17, "which *must* come up soon, you know," as people say. Few people could wait till 17 did emerge, and the bank in consequence of this craze did a really good business. It is an amusing trait in the natural history of the croupier that the functionaries of the card-tables are much greater men than their comrades of the roulette-table. The former are *messieurs*, the latter, simply *hommes*. In private life they are often good friends enough, but *their wives do not visit each other*. When he is not spinning the little ball or dealing out the cards, the croupier often has some respectable trade, which he exercises at home; he is a tailor, a waiter, perhaps a fencing-master. Rather a good story is told of the impassiveness of the croupier. It was at Baden-Baden, between Sadowa and Sedan; the ruler of Germany was walking in one of the alleys with the Emperor of France. The crowd had deserted the tables to stare at these great monarchs. Some one asked the senior croupier, *le père* Martin, why he did not take a holiday and see the crowned heads. "King William we are always seeing," said the old man, "he is no novelty here." "And the Emperor Napoleon?"—"Ah, the Emperor, he still owes the bank twenty-five louis."

The bank in M. Blanc's time was not the impersonal thing which we presume it is to-day. There was a whole legend about the eccentricities of M. Blanc. Once a ruined player forced his way into the bedroom of the banker, and asked for 10,000 francs. M. Blanc replied that he must consult his partners. The gambler then locked the bedroom door, and began to hammer a great nail into the wall. "What do you mean, sir?" asked the old man, in a rage. "Why, I mean to hang you to this nail, unless you open that bureau and pay the 10,000 francs," said the other, still hammering. There was nothing to be done but to pay the money. M. Blanc had his superstitions, like his patrons; and, when he was at Monte Carlo, played "patience" all day, to judge, by the results, how his other banks were prospering in Germany. He once played himself at Homburg. The day was very hot, and Mme. Blanc had come out into the gardens without a sun-umbrella. She bought a very pretty one, which cost four louis; and M. Blanc, who hated paying away small sums, tried to win back the expense at the card-table. He would not take the chair which one of the servants hastened to offer him. He put down two louis on *noire*, won, then lost, after many losses took a seat, and stayed at the tables till they closed. By that time the umbrella had cost 91,000 francs. From this veracious anecdote we gather that M. Blanc would have made a thoroughly bad gambler. A good gambler backs his good luck with courage, and leaves off playing when he is not in the vein. A bad gambler has no pluck when he is winning, but backs his bad luck with desperate tenacity. M. Blanc had all the courage of the Chevalier du Barri, the worthy uncle of Mr. Barry Lyndon. The usual maximum at the card-table is 12,000 francs, beyond which sum a player may not increase his stake. The great Garcia, that hero of Spain, found these limits (which make the fortune of the bank, for they stop all martingales, or systems of doubling) too narrow for his genius. He asked M. Blanc to let him raise the maximum to 60,000 francs, to which the banker courteously assented. In a few weeks the victorious Garcia borrowed a few louis from the bank to take him back to Paris. M. Blanc, if we may believe M. des Perrières, to whom we owe much of this biographical information, had a genius for advertisement. In Monaco, as in many other towns on the Riviera, a rite is performed on Good Friday which draws great crowds, but too closely reminds the spectator of the spring festival of Adonis in ancient Greece. M. Blanc seized the opportunity, and placarded Nice with advertisements in these terms:—

VILLE DE MONACO.
Grande Procession Allégorique.
A l'Occasion du VENDREDI-SAINT
Il n'y aura qu'un DEMI-REFAIT.

That is to say, on Good Friday the bank would only take half of its usual advantages.

A place like Monte Carlo, full of money, and full of dupes, naturally attracts gentlemen who correct the errors of Fortune in ways more or less ingenious. A certain Comte de Montvilliers has left a legendary fame. At Wiesbaden he found out a way of stopping the gas by which the rooms were lighted. He laid his plans well, in a moment all was dark, and the Count was off with an armful of banknotes, and as much gold as the ancestors of the Alcmæonidæ carried from the treasure-house of Crœsus. Next night the rooms were lighted with lamps. Montvilliers, who was an intelligent bandit, changed his method. He managed to sneak under a divan in the rooms, and stayed there when all the company and the croupiers had departed. When all was darkness and silence he crept out, lighted a dark lantern, and uncovered the roulette table. With a pair of pincers he gently tightened the wires of all the red compartments, so that the roulette ball could not easily enter them. Next day he backed black, and naturally with success. But a judicious croupier had marked the run on black, and examined the roulette wheel. Without saying anything, he reversed at night the arrangement of Montvilliers, who next day lost all he had gained by resolutely backing his favourite black. Scoundrels who have not the nerve for these heroic measures watch the tables and sweep up the stray money of the unobservant. It has happened to us to detect an amateur thus removing our stake to another colour, where the amateur proved unsuccessful. One of these scoundrels hit on a really happy thought. A player had left a large sum of gold on red, where it was doubled and doubled again. Two louis rolled off, undetected by the owner, to the marked off space called *envers*, where they prospered, and became twenty-four louis. A thief who was looking on knew this, and the head croupier was also well aware of it, and of the intentions of the robber. But the latter succeeded. Sidling up to the real owner of the money, he said, "Sir, will you do me a favour? I have twenty-four louis on the *envers*; I dare not take them up, for my father-in-law has just entered the room, and I have promised him that I will never play." The other bowed politely, raked in his own twenty-four pieces of gold, and shortly afterwards presented them to the ingenious guardian of orphan moneys.

We may leave the topic of modern playing at public tables with a piece of invaluable advice, borrowed from M. des Perrières:—"C'est de ne jamais aller au jeu avec la femme que l'on aime, et d'éviter même d'y aller avec celles que l'on n'aime pas."

CARDINAL NEWMAN'S ADDRESS AT BIRMINGHAM.

BIRMINGHAM, which less than a century ago, at the time of the "Church and King" riots, was known as a stronghold of Toryism and of the Established Church, has been no less conspicuous of late years as a centre of Liberalism and Dissent. But it has not been one-sided in its religious liberalism. The Roman Catholics have for many years held an influential position there, and a custom grew up among them between twenty and thirty years ago of holding an annual meeting at the Town Hall, when some distinguished personage, clerical or lay, is asked to preside and deliver a public address. This year they not unnaturally requested Cardinal Newman to occupy the chair, and he accordingly addressed them last Tuesday evening, taking for his subject the change in the general feeling of the country towards Roman Catholics which has occurred during the last thirty years. The choice of subject was eminently characteristic of the man. No reader of the *Apologia*—to say nothing of his earlier works—can be unaware that Cardinal Newman, like most men of genius, has always shown himself very sensitive to the opinion of his fellows. It was evidently a keen distress to him personally, over and above what he felt as an insult to his religion, when, amid the frenzy of the Papal Aggression scare, a speaker in the House of Commons gravely described what were in fact the cellars of the Birmingham Oratory as "underground dungeons from which no shrieks could be heard," or when, as he now tells us, in a village he knew of, "it was prophesied that, if the Papists got the upper hand, the streets would flow with blood." Nor can any one reasonably blame him for smarting under the misjudgments and appreciating the sympathy of his countrymen. It is no less foolish and wrong to ignore public opinion than slavishly to defer to it, and it is perfectly true that "the good opinion of others—their respect, their good wishes, their sympathy, their kindness—is a very great pleasure, a very great gain." Cardinal Newman may therefore pardonably dwell with satisfaction on the contrast between the sort of welcome accorded to Cardinal Wiseman by Englishmen in 1850, which however was partly the Cardinal's own fault, and—as he modestly phrases it—"their conduct towards us now." He was no doubt thinking, though he does not

expressly say so, of the very different reception given to himself last year when he returned from Rome with the same scarlet mantle on his shoulders; and indeed he does speak warmly of "the abounding marks of good will" he has of late years and now again recently received from his countrymen. Their respect for him will not be lessened by knowing how sincerely he values it, though his life bears witness that it weighs but as dust in the balance when any question of conscientious conviction is at stake. But the main purport of this address is to indicate the causes which have led to so marked a change in the tone of public sentiment, not towards himself personally, but towards the Roman Catholic body generally, and he specifies three leading reasons for the happier relations which now prevail between followers of the rival creeds.

There is first of course the psychological law of reaction which, especially when "a kind-hearted people like Englishmen have gone mad," would make the violence of act and word displayed at the time of the Papal Aggression eventually turn against itself, "and then a generous feeling would come over them that perhaps they had been too hard upon us." But closely connected with this there was a second reason for the change in the discovery that "their alarm somehow had been unnecessary," and that the measures to which it had given rise were useless as well as unjust. The Act of Parliament, passed in haste and repealed at leisure, was vexatious and offensive to those at whom it was aimed, but it could have no practical effect without proceeding to direct persecution, and of that there was no idea. But the third and most important reason, to which the Cardinal devotes a considerable portion of his address, is of a more positive kind. There was, he says, "a great misunderstanding," which has been removed partly from the very consequence which was then anticipated and dreaded having actually followed, that is, from the numerous conversions which have since taken place. But here the Cardinal must allow us to interpose a remark. There had been, mainly through the influence of his own example and writings, a great many conversions to the Church of Rome before or during the time of the Papal Aggression excitement, more weighty, if not more numerous, than any which have occurred since. And we cannot but think that the converts themselves were partly to blame for the misunderstandings to which the Cardinal refers. "Of course," he observes, in reference to a prevalent misinterpretation put by Protestants on the creation of the new hierarchy, "it would be very absurd in us, and, I may say, very wicked, if we said that this was a heathen country, and needed conversion as a heathen country needs it." But Protestants might be excused for taking those who did say so at their word. The movement we commented on the other day for getting the Elizabethan martyrs canonized is notoriously of convert origin, and is looked coldly on by old English Roman Catholics, and a question addressed by one of the not least distinguished of the early Tractarian converts to an Anglican friend—"When do you mean to become a Christian?"—represents fairly enough the tone of language, if not of sentiment, too commonly adopted among them at that time. Another prominent convert—who ten years ago signalized himself by modestly advising the Vatican Council (which he believed to be guided by the Holy Ghost) in the name of the whole body of English converts (who had never commissioned him to speak for them and whose great leader notoriously disagreed with him) to define Papal infallibility—quietly states in a work recently published that since the Reformation the English people "have sunk in religion back to the state of savages." Cardinal Newman's language is of course of another kind. "There is a widespread knowledge of Christianity among us (Englishmen), a love of the main truths, a zeal in their behalf, and an admirable prodigality, as I may call it, of contributions in furthering them." He adds indeed that this is not inconsistent with holding that "they only know half the Gospel," and wishing by all fair and honest means to bring them to a knowledge of the rest; on which we might perhaps observe that those who have a love and zeal for "the main truths" must surely know something more than half the Gospel. The Cardinal's point however, in which he is no doubt substantially right, is that the better understanding which has come about between Roman Catholics and Protestants is largely due to the two parties becoming better acquainted with each other. As he puts it, "the Catholics in England fifty years ago were an almost unknown sect among us," whereas now, partly through the number of converts, partly through the influx from Ireland, such an interpenetration has taken place as could not fail to dissolve many prejudices and misconceptions bred from mere ignorance. "Protestants have found them to be men whom they could be drawn to like and to love quite as much as their fellow-Protestants—human beings in whom they could be interested and sympathize with, and interchange good offices with, before the question of religion came into consideration"; and hence by a natural process "that Guy Fawkes or Duke of Alva sort of Papist, who hitherto stood in their minds for the normal representative of a Roman Catholic," has gradually passed into oblivion. We note with pleasure this contemptuous disclaimer of sympathy with persecution in the past.

The Cardinal goes on to say that this improved mutual understanding has come about not only by closer personal intercourse, but also by a knowledge in most cases "not personal and experimental, but public," derived from occasional witnesses, or through the periodical press. And he specially, and we think not unjustly, instances the kind of influence exerted in this way by Pius IX. over English opinion in dispelling the conventional idea of a Pope as "all that is bad"; and that in spite of there being a great deal in his acts and policy peculiarly distasteful to Englishmen. Something was due no doubt to his misfortunes, which were sure to appeal to their generous sympathies, but more, the Cardinal thinks, to the "series of tableaux" brought before them in the reports of his reception of visitors at the Vatican. "The main cause of his popularity was the magic of his presence, the graceful intermingling in him of the human and the divine, the humour, the wit, the playfulness with which he tempered his severity, his naturalness; and then his true eloquence (?) and the resources he had at command for meeting with appropriate words the circumstances of the moment overcame those who were least likely to be overcome." And he proceeds to recount how a Protestant friend of his own, "a man of practised intellect and mature mind," was moved to tears by a discourse of his Holiness at one of these receptions. There is much force in this, for there is a sense in which it is quite true to say that Pius IX. was popular in England, and it is generous of Cardinal Newman to dwell upon it, for the late Pope certainly showed no great affection for him. But his hearers were evidently intended to draw the moral of this eulogy partly from the remark which follows that, notwithstanding the persuasive manner in which Pius preached our holy religion, "we have not lost by his being taken away," inasmuch as "in his successor I recognize *a depth of thought*, a tenderness of heart, a winning simplicity, *a power answering to his name*, which keep me from lamenting that Pope Pius is no longer here." The words we have ventured to italicize indicate qualities in which everybody must discern, without being expressly told so, a marked contrast between the late and the present Pope.

Cardinal Newman concludes by observing that, while he rejoices in the increased friendliness of his countrymen towards Roman Catholics, he sees no sign of their being more friendly to the Roman Catholic religion, and it seems to him questionable whether a country can long continue "in the unnatural position of thinking ill of a religion and thinking well of believers in it." One might expect that either dislike of their creed would create dislike of its adherents, or goodwill towards them would issue in goodwill towards their creed. "How this problem will be solved," are his closing words, "is one of the secrets of the future." The phenomenon thus emphasized is unquestionably a remarkable one, the more so when we bear in mind the fact previously pointed out by the lecturer, that "the main truths" of the Roman Catholic religion are held in common with them by English Christians who are not Roman Catholics. And it could hardly fail to occur to a less acute observer and reasoner than Cardinal Newman that there must be some reason for this persistent distrust of a religion, whose professors have ceased to be looked upon with suspicion or dislike, by those who after all hold the same leading doctrines themselves. There must surely be something, if not in the creed itself, in the existing method of presenting and enforcing it, to account for this seeming perversity. The question is too wide a one to enter upon in detail here, but two observations, suggested by passages in the address before us, may fitly close our comments upon it. Cardinal Newman says of Pius IX., without expressing either approval or disapproval of his own, but as what could not fail to damage his popularity in England, "He claimed, he exercised *larger powers than any other Pope ever did;* he committed himself to ecclesiastical acts *bolder than those of any other Pope.*" When we think of the Hildebrands, the Innocents, and the Bonifaces of mediæval history, this language sounds very strong indeed, and it was evidently intended to be strong. But how did Cardinal Newman himself describe the "largest" and "boldest," as well as the most important and far-reaching of these acts of autocratic power of Pius IX. shortly before it was consummated? He spoke of it in a letter to his own Bishop as like "thunder in the clearest sky"; as a decision which "may be most difficult to maintain logically in the face of historical facts," and which was being extorted by "an aggressive, insolent faction"; which was leading "some of the truest minds to give up theology as a bad job"; and which, if it was carried through—as it was three or four months afterwards—would prove that "it is God's will to throw back 'the times and moments' of that triumph which He has destined for His Kingdom." We might quote a good deal more to the same effect, but this is enough. Can the Cardinal wonder that an act of which he could thus speak himself in its bearings on his own communion should tend, in itself and its consequences, to increase and perpetuate distrust among those without its pale? Once more, he has himself reminded us that Protestant England is not a heathen country, but has a widespread knowledge of Christianity, and a zeal and love for the main truths of revelation. Let us turn to a country which by name and antecedents alike—for its sovereigns have borne for centuries the title of "Catholic"—may be considered the native home and stronghold of Catholicism in his own sense of the word, a country whose whole history and national traditions for above a thousand years may be said to have ingrained Catholicism into the hearts' blood of its people more deeply even than the history of the last three hundred years has ingrained Protestantism into the blood of Englishmen. What is the testimony of a recent traveller, who spent many months in various parts of Spain and took pains to familiarize himself with all classes of the inhabitants, and who writes in no spirit of narrow Protestant intolerance, as to the religious knowledge and faith prevalent there, where the Church of Rome has had her own way for centuries without rival or opponent? Those who have read Mr. Rose's *Untrodden Spain* will

remember that he feels constrained to tell us—not in a spirit of mockery or triumph but of deep regret—a sad and consistent tale of religious ignorance and "the decay of religious faith" in all classes alike, which is but too aptly summed up in the answer given him by a Spanish boatman, when asked why he did not go to church, "My religion has broken down." And we have heard his testimony entirely corroborated by Roman Catholic witnesses. Does not this inevitably suggest that there must be something wrong, we do not say in the theological creed—for with that matter this is not the place to deal—but at least in the practical teaching and working of a religion which, under circumstances exceptionally favourable, has produced results so little satisfactory? Why do Spaniards who know, or ought to know, "the whole Gospel" exhibit so much less zeal and love for it than Englishmen who "know only half"?

A STRANGE DICTIONARY.

TRAVELLERS come upon curious vocabularies in foreign parts. We recently met in Cairo with what professed to be a list of colloquial Arabic words for tourists, in which neither "donkey" nor "donkey boy" occurred. And in every Continental hotel queerly translated *menus* hang on the walls. Such was the famous *carte* at Dieppe in which "Soupe à la reine" was given as "Soup at the Queen," and "sauce piquante" as "the sharp sauce." Not long ago one could read in a Greek inn of "excursions for theater-boxes and tickets for complaints": and be told that "the director is responsable only for such values that have been deposited at his office." In another place a notice is hung in the porter's glass case to say that here "informations shall be given." In Italy we have read of a mysterious, but evidently very intoxicating, drink called "whishyoldirish," and have been advertised of the existence of "worm and cold baths." Still more amusing are lists of words which by grammatical uniformity ought to be in our vocabulary, but which the stupidity or obstinacy of our forefathers led them to reject. There is a little poem, quoted, if we do not mistake, by Mr. Marchant in a book on *Betrothals*, which offers us an example, in expressing the feelings of an ardent lover, of the "beautiful unison and consistency of our language," and which, until we had the good fortune to meet with a German dictionary which has had a large Continental circulation, we thought unrivalled. One verse must suffice here:—

> Let my longings not sink,
> I would die if they sunk!
> Oh, I ask you to think
> As you never have thunk:
> And our fortunes and lives let us link as no lives could be lunk.

But for a long series of such solecisms, for a persistent, unwavering statement of what the English language may be in the mind of a foreigner, a little volume we recently met, which is already in its sixth stereotype edition, and therefore is not only presumably very popular, but carefully revised, exceeds everything except the English names in Paul Hentzner. No dictionary can be above criticism. More than any other kind of book, it is subject to be marked by the peculiar views of the compiler, whether in the transliteration of extraneous words or in the definition of simple ideas. Dr. Johnson was sometimes in a difficulty, and to explain such a word as "net" he postponed the question, and called it "a series of reticulations"; which is no better than the definition of another lexicographer, whose name has not been preserved, and who called a net "a lot of square holes tied together by a string." But a dictionary like Johnson's is one thing; a dictionary of translated words is another. One of the best examples of what this kind of work should be is of course Mr. Bellows's French Dictionary; and assuredly one of the worst is the German book referred to above.

We have long wondered why it is that the Germans have almost a monopoly of these curiosities of literature. So many Germans are acquainted more or less intimately with English that the number and daring of such translations are remarkable. German is a language by no means very remote from English. The exact equivalents of thousands of words are easily found; and, even in the matter of pronunciation, the German's frequent failure to speak good English may be accounted for on the principle that the two tongues are sufficiently near each other for him to be able to pronounce English with a German accent. French is written so differently from its spoken sound that the learner must speak by ear, not by sight; and French is, with the single exception of Arabic, the easiest modern language to speak, and speak badly. It is not difficult to understand why a Frenchman cannot pronounce English or German double consonants; nor is it odd that a Teutonic learner cannot make much distinction between the ten or a dozen different words which to his ears sound alike, as eau, au, aux, oh, haut, &c. But the German's tendency in speaking, and still more in writing, English is not of this kind. He is troubled rather by the ghosts of words which should exist but do not. We occasionally use "aberration," but never "aberr." We often use the form "abject," but never "abjectedness." We think a law may be abrogated, but do not characterize it as "abrogable." So, too, the law-breaker may abscond, but we are careful not to talk of his "absconsion." Neither do we say that he ever "abid" anywhere, that misfortune has "betid" him, or that he "wox" incautious, and was therefore "undid," and was eventually hard "hot." Perhaps we ought, by grammatical laws rigidly applied, to be the happy possessors of such forms as these. That we are not may be our misfortune; the editor—Herr Wessely—of Tauchnitz's "Pocket Dictionary of the English and German Languages" (Leipzig, 1876) evidently thinks it our fault, and uncompromisingly teaches us our own tongue as it ought to be, in his opinion at least. The most purely original portion of Herr Wessely's work is the "Table of the Irregular Verbs"; it has apparently been evolved by a mental process peculiar to the High German idiosyncrasy, and is valuable as affording a knowledge, not only of the words used above, but of many other words of a similar construction and equally delicate shades of meaning.

Under the letter "A" alone in the body of the Dictionary we have column after column taken up with such useful words as abalienate, abaptize, aborr, aberring, absinthian and absinthiated, absist, absorbition, abstringe, accommodableness, accommodateness, acquirable, and aggroup—words which may perhaps be conceived to exist, but which few English ears ever heard. Besides these, there is an equally extensive class to which it is difficult or impossible to assign any definite meaning. They may be found useful to some future Gulliver or Alice. But what can be made of abature, abited, abstrude, absume, acclive, or accritude? It is not very difficult to "abnodate" the puzzle offered by amusive, or angulous, but a man might be "appoplexed" before he could guess the derivation or object of aggrogled, or antigugglер. There are many words, too, which are absolutely unknown to the English of this generation. They do not call up the slightest echo of sense in our ears. Agio and agiotage may just pass muster, but what shall we say of achor, adust, aubin, and aam? This last is, we are told, a substantive, and the equivalent of the German "ohm." Chestexplorer is, it seems, the English for stethoscope. Under the important and often-used expression Chickabiddy we are desired to "see biddy." Biddy is explained as "Hühnchen." There is no mention of Bridget, even in the supplementary "Collection of the most usual Christian Names and the most remarkable Geographical Names." This part of the work should have been called a "Collection of the most remarkable Christian Names and the most usual Geographical Names." Ead, we read, is the English form of Ida. Alcairo is the English for Cairo. Bob or Bobby is the usual English pronunciation of Robert. We write the German Charlotte as Charlot, and Caecilie as Ciss. Conny is our equivalent for "Constantin," Denis for Dionysius. Frat stands with us for Euphrat, and Gill for Gulchen. We write Guiny for Guinea and Gui for Guido. Guy is not mentioned. Mawd is our form of Mathilde, and Mawdin of Magdalene, while Mawdlin stands in English for Lenchen.

From the quantity of mere pot-house slang included in the Pocket Dictionary we might conclude that Herr Wessely is either an innkeeper himself, or has been specially hoaxed by some English "chapman," who favoured him with the meaning of such words as awk, collop, chump, and "big-wig," which last is rendered into German as "ein consequenter mann." Besides "chapmanry," which is translated by "kundschaft," there are many expressions relating to trade, and, strangely enough, to cheese-making, cider-pressing, and similar country employments. The obsolete words may be accounted for by supposing that Herr Wessely has been studying the tavern scenes in Ben Jonson and the early English dramatists; but where did he find "arrivalbook" and "call-horn"? The compound words, indeed, are of startling length and complication. Some of them are of everyday use, and will be most valuable to Germans visiting England and anxious to study our domestic institutions. They will not be long on our shores without hearing "actionthreatener," "aimsight," and "apronstringbold," especially the last. But they may go further afield before they meet with apronman, alightboard, airynotions, atiptoe, bakemeats, bavin, belletrist, biland (a peninsula), bilander, brineprover, cabbageturnip. Perhaps these combinations are common in certain country districts, but Herr Wessely's pupils may search in vain in the dictionary for such a word as cheesecake, while they will hardly succeed in obtaining roast beef if they ask for it as "carbonade." Even when he gives old English words, he mistranslates them. Thus he has "codger," and explains it by "ein bäuerischer Mensch." The word should be "cadger," and should be explained by "pedlar," with perhaps a reference to its origin in days of falconry when the man who bore the "cadge" or cage on which the hawks were perched was known as the cadger. Hawker, an ordinary English term for a travelling merchant or "colporteur," has a similar origin and is correctly given by Herr Wessely. "Airling" is a romp or a tomboy. Edulcorate is translated by *aussüssen*, but the latter expression is not given among the German words, and edulcorate remains a puzzle. Under "by" we have bygone, bylane, bylaw, byname, byspeech, bystander, byway, byword, but not byplay or bypath. Croo is given as an English word, and is translated by *gurren*; but *gurren*, again, is not to be found in the German list. In fact, the number of such omissions is one of the most singular features of this remarkable work. We have such obsolete or unused terms as catercousin, candlebomb, cubature, crummy, chitterling, brush, brustling, burgess-ship, abord, abrood, apeak, aslope, await, astilt, asquint, and many similar and unfamiliar combinations. What is abb? It is translated by *weberzettel*, a weaver's shuttle, and may be a common technical term in some places, and so are boss in the sense of master, and abernethy in the sense of biscuit; but we did not expect to find either in a dictionary, any more than abecedarian, abece (an alphabet), smithery, slabby, pituitous, meslin, looby, lungsick, or Loyds (*sic*), which is translated *schiffsversicherungsverein*, as if we were

in the habit of calling all insurance offices of the kind by the one name. But it would be impossible to open a page of the volume without discovering such forms, and we may heartily recommend the book as a source of unfailing and inexhaustible amusement to the weather-bound traveller within reach of a copy. Even if it "snew" (p. 223), he might not be sorry to have "pight" his tent in such a place, nor will he have "dempt" his labour lost when he has "lough" over Herr Wessley's very "Irregular Verbs."

THRIFT AND POLITICS.

SOME foreign critics have recently told us that we are, without exactly knowing it, in a condition of political "hot bearings," as an engineer would put it; and that, though familiar with England and with other countries where political feeling runs high, they do not remember to have seen an instance of an equal elevation of temperature. This is probably an exaggeration, the actual state of English feeling being almost proverbially inscrutable to foreign observers. Yet now and then incidents do occur which certainly seem to indicate the existence of a certain amount of inflammation. It would be difficult, for instance, to mention any subject which seems at first sight less likely to cause excitement than that of national thrift or national improvidence. There has been lately a good deal of interest shown in this question, and this interest is certainly not a thing with which anybody need quarrel. The speech of Lord Derby on which we recently commented is only the latest of a series of utterances in print and on the platform by persons of more or less position. As usual in such cases, there are a good many nostrums proposed, and the proposers are very confident each in his own nostrum. They may be expected to do a little amicable fighting among themselves, and so long as this fighting does not hinder their very laudable and admirable designs, it does not much matter. But when one local plan, admitted to have worked and to be working admirably, is attacked on the score of its being "an insidious form of political bribery," and when the exponent of another plan is greeted with the somewhat irreverent cry "You're a Papist," the matter assumes a different complexion. When people begin to see Jesuits, or to see Tories, as the case may be, in plans for the better prevention of pauperism and an uncomfortable old age, it must be admitted that the political thermometer seems to deserve a little attention.

Two incidents which have occurred within the past week have given occasion to these remarks. Diligent readers of the newspapers may have observed for some time past a controversy going on about a body cal'ed the Stroud Conservative Friendly Society, and on Monday evening last a meeting was held in London to hear something more about the matter. There is no need to enter into the details of the constitution of this society, which is admitted by its antagonists to be financially sound, and to accomplish its object admirably. The plan on which it works was, it seems, explained in an essay which gained a prize in a contest instituted some years ago by Mr. Forster, and adjudicated upon, among other judges, by Mr. Thomas Hughes, who presided at Monday's meeting. The names of Mr. Forster and Mr. Hughes would seem to be sufficient security that, if there be any Tory venom in the Stroud plan, it must at any rate have been concealed with singular skill. Indeed Mr. Hughes's position appears to have vexed the Liberal opponents of the Stroud scheme not a little. It is said that its champion, Mr. Holloway, is the Conservative candidate for the Gloucestershire borough, and it may be remembered that the political history of Stroud was at the last election an eventful one. Politics there run very high, and while Mr. Holloway alleges that it would have been fatal to his plan to admit jarring elements in it, his opponents allege that its success is in some mysterious way a form of bribery. Why they do not set up a similar society of their own we cannot pretend to say, for the plan is not patented or copyrighted, nor have the allegations of corruption brought against its administration been in any way substantiated. But Mr. Brand, the son of the Speaker, and connected with Stroud by political ties, wrote to Mr. Hughes, ingenuously remarking that he was sorry to see the announcement of his chairmanship. He further made the handsome offer that "to show his good faith in the matter," he would co-operate with Mr. Holloway if the latter gentleman would "drop the name of the Society," and put two or three well-known Liberals on its committee. In this case Mr. Brand would become a member, and "forget the taint of suspicion which attaches to the Society"; himself, it may be added, forgetting that this taint has been attached entirely by himself and his friends. We hope Mr. Brand will not be angry with us if we say that his phraseology and the tenor of his offer remind us a little of the famous stratagem known as the confidence trick. Mr. Brand's plan is the confidence trick with a variation. In the accepted form of the manœuvre, the victim, to show his good faith, deposits something valuable against the worthless promise of his new friends. Mr. Brand, "to show his good faith," deposits his own membership and that of some of his friends in a confessedly flourishing undertaking, and against this Mr. Holloway is invited to give up the management of the Society, in forming which he and his friends have borne the burden and heat of the day. This certainly seems to savour of the well-known "fault of the Dutch." As for the facts, every one who knows anything of country towns where party feeling runs high knows that Mr. Holloway's allegation is a perfectly just one. To invite the co-operation of both parties in any movement would be an almost certain plan of ruining its success. It may be a pity that there should be "blue aisles and buff aisles in the Church," and blue friendly societies and buff societies outside of it; but at present (though we cannot undertake to be accurate in the political colour-science of Stroud) it would appear as if the buff admirers of thrift were of the prudent, but scarcely heroic, opinion, that it is well to let the blue admirers of thrift run the risk and take the trouble, while they reserve a share in the profits for themselves. It may or may not have been wise of the Conservative Friendly Society to decline this view of the matter, but there was certainly nothing unnatural in their proceedings; nor, except at a time of a considerable political excitement, is it easy to understand the attempt to make political capital of the matter. What would be thought, supposing there were no Reform Club, of a London Liberal complaining of the base corruption which excluded him, unless he changed his politics, from taking his lunch at the Carlton?

The very next day another meeting was held at the Mansion House, where, though party politics did not directly crop up, something of political heat was shown. The meeting had been called in connexion with a certain National Thrift Society, of which we do not pretend to know much, and of which that great devil's advocate, the Charity Organization Society, seems to have fallen foul. Under these circumstances, the Lord Mayor, Cardinal Manning, and other persons of distinction who attended, thought it well to adjourn the meeting, after having previously kept it waiting some time while they sat in private but unavoidable conclave. It was not unnatural that some dissatisfaction should be felt at the disappointment and delay, but this dissatisfaction seems to have taken a curiously unreasonable form. Cardinal Manning, as we have said, was a speaker, and the chief advocate of the rather mysterious society is said also to have been a member of the Roman Catholic Church. It therefore seemed logical and pertinent to some of the malcontents to inform this gentleman that he was a Papist, and to break up the meeting with cries of "Jesuits." The resurrection of our old friend the Jesuit might, from the merely humorous side, be viewed with amusement, if not altogether with satisfaction; but it seems a little serious that good advice should be looked upon with disfavour because the adviser happens to be or not to be a Jesuit. It is recorded that an ingenious debtor, who was in trouble before the redoubtable Jeffreys, once got off by the happy, though irrelevant, remark that his creditor was a Trimmer. In the same way, the objectors at the Mansion House appear to have imagined that it was possible to dispose of Cardinal Manning, or of Mr. Bowden Green, or of both, with the simple remark that they were Papists. Cardinal Newman could not have been aware of this fact when he delivered his speech at Birmingham on the same day, or he would probably have felt inclined to modify his consolatory, and in the main correct, remarks on the improved attitude of the generality of Englishmen towards his co-religionists. It is to be feared, indeed, that not very many persons are "at the height," as they would say in France, of the Mansion House malcontent. "Popery and Savings Banks" can hardly, at this time of day, work as a revival of the old anathema of "Popery and Wooden Shoes." But the attempt is a well-intentioned, if an unskilful one, and has the advantage over the conduct of the Stroud Liberals in point of irrelevance and illogicality. It is of the essence of a heated imagination to be irrelevant and illogical. Now the mind has certainly less space to clear between the idea of a political Friendly Society and political corruption than between Popery and any particular form of the encouragement of thrift—unless perhaps the Mansion House speaker was under the impression that the savings of the people would be surreptitiously forwarded to Rome in the shape of Peter's pence.

The Stroud absurdity and the Mansion House absurdity, however, would hardly be worth comment if they were not part and parcel of something larger. When certain great chiefs of the Liberal—or, to speak more correctly, of the Radical—party inform us that Tories are all liars, that they are "terribly wicked," that they have manifested an ineradicable hatred of freedom and justice—they exhibit in comparatively high places exactly the same mood of mind as that which leads Mr. Brand to see a "taint" in a prosperous and honest Friendly Society, and the anonymous Mansion House enthusiast to see Popery in a proposal for national economy. A slight acquaintance with history of course enables any one to judge the chances of parties and persons who fall into this state of mind. They are, so to speak, judged, and it is a foregone conclusion that they cannot stand. But before this conclusion justifies itself, they usually make the country which has the misfortune to contain them pass some singularly bad quarters of an hour. To the man who sees all things in anti-Toryism, all things are by the same token expedient and allowable. He will not recoil before even such an enormous performance as that which has just been gone through at Liverpool by Lord Ramsay, or before such an insinuation as that famous one of Mr. Gladstone's about the Irish Church which Mr. Parnell has just translated into plain English in America. His Tories or his Jesuits, or whatever the special bogies may be, haunt him persistently, and the universe simply becomes a hunting-ground from which it is the whole duty of man to chase them. He abdicates for the time being his prerogatives as a reasonable creature, an honourable man, and a consistent politician. If his bogies support what he considers abuses in a foreign country, he abuses them for their support. If they interfere, he abuses them for their inter-

ference. If they comply with demands that are made of them, it is a servile compromise; if they resist, it is a stupid reluctance or a wanton provocation. In short the bogy-seer, though in himself a highly interesting study to the anthropologist, becomes one of the very worst citizens that can possibly be imagined. And the great danger of him is that he drags with him numbers of people who, to do them justice, do not see, or even pretend to see, the bogies for themselves. It is the old story of the never-to-be-sufficiently-regretted lion which used to give dignity and interest to the finest site in Europe. The people who discern the villany of the present Government, or the connexion of Popery and national thrift, may be counted by tens or (we should hope) units. The people who are likely to vote as if they believed the former of these imaginations are, we fear, to be counted by thousands.

TITHE RENT-CHARGE.

IN a time of agricultural depression it was certain that the traditional Englishman's grievance of the tithe would somehow or other be revived; and that the public mind is but hazily cognizant of the actual state of the question may be inferred when a professional correspondent of the *Times* can be found to write of his own parish that in it "the tithe rent-charge has been long since impropriated or sold in consequence of the insolvency of the vicar." There is an unconscious happiness of blundering in the terms of this proposition which probably escaped the notice of all but a technically instructed circle of readers, while at the same time the practical experience of the writer illustrated a real, if somewhat minute, anomaly in the working of the tithe-commutation system. A system which has now been in operation for nearly half a century probably appears, in popular estimation, to have existed from time immemorial, and the actual tithe of produce, taken if necessary in kind, which was the basis of the older system, may be treated as of prehistoric date, interesting chiefly to the collectors of blue and white earthenware. Among the Dutch tiles which may still here and there be found set round the fireplace in a country town, a familiar pair of pictures represented on one side a canonically-attired person, regarding with beaming face and arms outstretched a countryman carrying a small pig; while on the other side the same figure, with averted face and in an attitude of disgust, turns from the countryman's wife, who is holding out a small baby. The hidden sense of this graceful satire is supposed to lie in the contrast between the tithe-pig and the tenth child, and in the idea of clerical greed and lack of charity which it suggests.

The tithe rent-charge now payable was substituted in 1835 as a commutation for the estimated annual value of all the ordinary tithe then customarily received, or, in other words, of the tithe of produce from the land; and this tithe was either "great," the rectorial portion, or "small," the vicar's share. A detailed account of the distinction between these main divisions of the tithe will be found in Mr. Blunt's *Book of Church Law*; but it may be sufficient here to give the rough and general explanation that the great tithe is that of corn, and the small that of pasture and minor produce. The original intention of all tithe payment was for the provision of spiritual and pastoral care in the places whence the tithes were derived; and in the undertaking of this charge by monastic and other ecclesiastical corporations was laid the foundation of the principle of alienated, or, as it is technically called, "appropriated" tithe. "Impropriated" tithes followed as a result of the dissolution of the religious houses; and the distinction is clearly exhibited by Mr. Blunt in a note:—"Appropriations are the assignment of tithes to clerical corporations, whose members, or some of them, are qualified to do the proper work for which tithes are intended. Impropriations are the assignment of tithes to laymen who are not so qualified." "A very small proportion," he adds, "of the great tithes remained in the hands of the clergy after the Reformation; and the rectorial tithes now held by the clergy are the great tithes of lands that were then waste or worthless, but have since been improved." By "the clergy" in this sentence Mr. Blunt evidently means the parochial clergy, as appropriated tithes belonging to the secular corporations remained, and still remain, to a large extent under the jurisdiction of the Ecclesiastical and other Commissions. The "impropriated" tithes have become merely one of the ordinary securities in private property, and in some cases have been extinguished by sale with the freehold—a process by which every man on certain estates is said to have become his own rector. The corporations who held the appropriations of tithe were of course bound to make provision for the spiritual care of their parishes, and did so by means of permanent deputies, whose office was distinguished by the title "vicarius," or "vicar"; the incumbent so styled being really the deputy of the corporate parish priest or "curate." Till a very recent date the existence of this title told its own ecclesiastical history. We wish that it did so now. A hasty measure, passed without real discussion or notice at the close of a Parliamentary Session, and confessedly devised to conciliate a few dissatisfied and weak members, male and female, of clerical society, who imagined their importance lessened because the subordinate designation of "deputy" was not conferred on them, has flooded the Church of England with a number of so-called "vicars," and the historical sense of the term has in consequence been practically lost. Hence it has become possible for an educated man, not versed in ecclesiastical technicalities, to write the singular statement which we have quoted about "the insolvency of the vicar" as the cause of "the tithes being long since impropriated."

But the principle of "appropriations" has been developed of late years in a new form, and the Dutch tile which consoled the eighteenth-century Nonconformist as he sat by his fireside exiled from municipal office has acquired a prophetic significance. The historical parson of the parish not unfrequently does receive the tithe-pig (in a commuted shape), and does not baptize the baby or recognise it in any way as under his pastoral charge. The Duke of Marlborough (under his earlier style of Lord Blandford) would not allow him to do so if he wished. The "New Parishes" are marked off from the old ones with the spikiest of Parliamentary fences, and the rector or vicar of the Mother Church is not allowed to trespass ecclesiastically on the "Incumbent's" or pseudo-vicar's domains; while the tithe, in the great majority of cases, remains attached to the original benefice. The Church Building Act of 1818 made provision, it is true, for the complete division of parishes for ecclesiastical purposes, and for assigning the tithe of each portion to its own church, and in many cases this has been done; but usually such a course could not have been taken without impoverishing the Mother Church or unduly diminishing its income, especially where the benefice was already a denuded vicarage. Accordingly it is not an uncommon thing to find the tithe rent-charge in some populous suburb of an increasing town collected for the benefit of an incumbent who has no more cure of souls in the parish than the Ecclesiastical Commissioners themselves; and this, to persons who do not understand the subject, may naturally appear as a great hardship and injustice, while it is in reality nothing of the kind. But a real injustice and anomaly, not the less annoying because it only deals with small pecuniary amounts, often arises incidentally in such cases, and requires legal, and perhaps also legislative, attention for its remedy. The assignment of tithe commutation is made upon separate fields or plots of land, of larger or smaller extent as the case may be. Taking one of the smallest of such plots from a chance tithe-map, we find a square half-acre assessed at an annual tithe value of 1*s.* 8*d.* Any one who is acquainted with the manner in which building land is laid out for lease or sale in a London suburb can estimate at once how many dwellings, from fifteen feet of frontage upwards, could be run up on such a site, and can calculate the proportionate tithe rent-charge on each of them, even after taking the assessed value at a two or threefold rental. As it is clearly impossible to collect any kind of rate by twopence or threepence per house, the law allows the tithe-owner to claim the whole value from any one of the occupiers, leaving him to recoup himself as he can; and, if he objects, to compel payment by distraint. There is probably not a beneficed clergyman in the kingdom who would act upon such a legal power; and the maxim "De minimis non curat lex" may be alleged as sufficient answer to the gravamen. But instances of hardship occasionally occur where a benefice is under sequestration, and this is plainly the state of affairs intended by the description to which we have referred. Another case, which happened some years since, fell within our own knowledge. A lady, owning and living in a good house upon one of the tithe-map plots in a London suburb, received from the collector under a sequestration notice of claim for all the tithe chargeable on the original land, on which several houses had been built by other persons. She was advised by a friend not to pay, as the tithe-owner had the power of apportionment, and would probably use it. A few days later her adviser was hastily summoned to find a "man in possession," who had taken in execution, among other things, apparently as appropriate to the occasion, a large family Bible. The claim was at once discharged under protest, and the knot was shortly afterwards cut by the death of the sequestrated rector and the appointment of a successor who was as likely to summon the Pope as the Sheriff to his aid in distress. In one large manufacturing centre it is said that a considerable portion of tithe has been lost beyond recovery in consequence of the unwillingness of the tithe-owner to collect it on subdivided properties. No such difficulty ought to occur, or would occur, upon land held in fee-simple, if the solicitors to the owner would take care, before letting or selling the land for building, that the tithe-rent charge was either capitalized by payment to the authorized trust-fund or secured upon some fixed portion of the property. In the case of settled estates where no power has been reserved to make charges on the land, the latter of these methods alone is now possible; but in any legislation which may be proposed upon the question of landed property it will be well to make some provision for the adoption of the former method where preferable.

It has been inevitable that, upon the coincidence of low agricultural prices with a high premium on the tithe rent-charge, complaints of the unfairness of a "sliding scale" should be heard. These will probably diminish with the fall in the premium which has already set in; and when the period returns for a value below par, it is scarcely likely that they will be heard at all. There is no doubt something to be said in favour of the view of clerical tithe-owners who object to the assessment of their rent-charge for taxing and rating purposes without any deduction on the ground of personal service; but there are considerations on the other hand which are worth being thrown into the balance. The English farmer, as a rule, has a settled antipathy to rates. He knows that they are part of the Constitution; but without any

definitely heathen or heretical belief as to the origin of things, he cherishes a suppressed and hidden opinion that some non-beneficent Demiurge must have had a hand in introducing into creation the element of rates, and that with an especial view to spite himself and the agricultural interest. But he does not accurately distinguish between rates and tithes, which latter he considers to carry the mark of the enemy about them, though his own parson, to whom he pays them, is not a bad sort of man by any means. Indeed in the matter of rates the parson is a fellow-sufferer with himself under the inventions of the malevolent spirit who devised them; and if the rector is perhaps a little hardly dealt with as to his assessment, the farmer's sympathy goes out all the more towards him, and he is the less inclined to think grudgingly of him as the consumer of the tithe. On the other hand, if the rector's assessment were reduced, by so much the more would the farmer's burdens be increased; for "Boards" have neither heart nor conscience, and "calls" must be met when they are made. On the whole, the clergy may do well to accept the tithe rent-charge with "the ills they know" attending on it, rather than fly to others which might bring more worry than relief in their train.

SHILLITO v. SHILLITO AND HIRST.

It has not been our usual practice to notice cases in the Divorce Court. There may be reasons, though we do not profess at all to understand them, for publishing full accounts of these suits in all their nauseous detail; but, generally speaking, there can be none for commenting on them, and for inviting attention to painful and often revolting stories of weakness and sin. Yet exceptions to the most salutary rules sometimes occur, and it is occasionally advisable to speak even of the cases which are tried before Sir James Hannen. As need hardly be said, the branch of law with which he has to deal is of very great importance, and legal questions of grave interest arise in his court. These may demand notice, and emphatically demand notice when they lead to decisions by juries which, if acquiesced in, can scarcely fail to do harm. Hard cases make bad law, and indignation at great moral turpitude sometimes induces juries to give verdicts which, though due to honest abhorrence of wrong, nevertheless strike at the root of all justice by overriding the law. Such errors must needs be protested against, for juries cannot be allowed to constitute themselves tribunals entitled to disregard all limitations in order to punish those whom they believe to be great culprits. It is true that these decisions may be legally reversed; but, notwithstanding this, it is necessary to point out how mistaken they are on account of the not unnatural sympathy which they excite amongst unthinking people. Quite recently a jury, nominally deciding on the facts, but really deciding on the law and facts, has given a decision of this kind, and, spurred no doubt by a just desire to punish abominable malice and wickedness, has arrived at what is perhaps the most astonishing conclusion ever come to in a court of justice. Although the verdict in the case mentioned at the head of this article was obviously prompted by honourable feeling, it must nevertheless be strenuously protested against as one of those judgments which, though they may at first win approval, really do substantial injustice, and tend to upset all that is valuable in law.

The circumstances of the suit which was adjudicated on in so singular a manner were most remarkable. Unfortunately they cannot be narrated without the mention of very unpleasant facts, which cannot be softened by any possible circumlocution, and can only be given as they are stated in the reports of the case. From these, which, it may be observed, seem to be in some respects very imperfect, it appears that the respondent, Mrs. Shillito, whose maiden name was Charlotte Jager, had for about nineteen years before her marriage with Mr. Shillito, the petitioner, lived in the house of the co-respondent Hirst, who was married to her sister. Hirst was a person of highly respectable position, and must have been a man of good repute amongst his neighbours, as he was deacon of the Park Congregational Church at Halifax, where he lived. No suspicion whatever of improper relations between him and his sister-in-law, Charlotte Jager, seems to have been entertained by any one. In 1878 Mr. Shillito, who was a widower with children, became engaged to Miss Jager, whom he had known for eight years, and after this engagement began as singular, and at the same time as painful, a series of incidents as ever were related even in the Divorce Court. In February 1879 Miss Jager quitted her brother-in-law's house by his order, and, as it was settled that the marriage should take place in London, she came to town. Before the marriage took place she showed to her future husband, Shillito, two letters which she had received from Hirst, threatening that, if she did not return to Halifax and get married from his house, he would make known scandalous secrets respecting her. The character of the letters was such as to cause Shillito to ask her whether there had been anything improper between her and Hirst. "She declared," to use the language of the *Times'* report, "that there was no foundation for any such charge or suggestion, and with this explanation or denial the petitioner was satisfied." The marriage took place on March 24th, 1879, not very long apparently after this incident, and Mr. and Mrs. Shillito went back to Halifax. A few days after their return Shillito received from Hirst a letter stating that "for the twenty years the respondent had lived under his roof criminal intercourse had subsisted between them." On making this known to his wife, Shillito could not, according to his account, obtain from her either a denial of the terrible charge made against her or a confession of its truth. Up to this point the facts were strange enough; but what followed was stranger still. On the day following that on which the painful scene between the husband and wife took place, Hirst called on the former, and, while asserting the truth of his statements, expressed his sorrow for what he had done. Shillito told him that, if he were "a demon from hell," he could not have done more to cause misery, and all must agree with the President of the Divorce Court, who said in his summing-up that the expression was no stronger than the occasion warranted. Shillito, however, not only forgave Hirst—forgiving a great deal it must be said—but burnt the letter; and it might naturally be thought that, after such conduct, the other would have desisted from his horrible persecution. Incredible as it may seem, this was not the case. If this extraordinary wretch was really penitent when he saw the unfortunate man who had suffered so greatly, his penitence soon deserted him, and he became yet more malevolent than before. Shillito shortly received letters in which the first accusation was repeated in a tone of triumph, and in which Hirst further said that Mrs. Shillito had been guilty with him since her marriage, and gave the dates and places of their meetings. Shillito told his wife of this charge; and, according to his evidence, she admitted that on one occasion she had been unfaithful to him. He expelled her from the house, and proceedings in the Divorce Court were instituted. The citation was served upon the respondent on the 2nd of June last, little more than two months after the marriage.

Such was the account of this very singular case given in the statements of counsel and in the evidence of the petitioner. That evidence was, however, contradicted on the material point by Mrs. Shillito. This unfortunate woman, who attempted suicide on the day after the citation was served on her, was put in the witness-box, and denied that there had been improper relations between herself and Hirst either before or after her marriage. She also denied that she had made the confession attributed to her. She admitted that, since her expulsion from her husband's house, she had written to him, saying:—"Whatever you may think, I can positively state that I never had any intimacy with Hirst since our marriage." Hirst himself was called, and stated that there had been nothing between Mrs. Shillito and himself after her marriage. His wife, whose evidence was taken at the suggestion of the Judge, said that before her sister's marriage her husband had confessed his misconduct to her; and that, though greatly shocked, she forgave him, in consideration of their children and of the number of years for which they had been married. He seemed deeply penitent, and promised, of course, to have nothing more to do with his sister-in-law. We may observe that this statement of Hirst's was repeated in the presence of the respondent (then Charlotte Jager), who denied the truth of what he said. Mrs. Hirst's evidence concluded the case; but it should be stated that, before it was given, two witnesses had been called who testified to a visit having been paid by Hirst to Mrs. Shillito during her husband's absence from home. Shillito was apparently informed of this visit by his wife.

As has been said, the facts of the case were singular in the extreme; but still they do not seem to have been complex or utterly baffling, and there were apparently only two conclusions which could possibly be drawn from them. It must, of course, be borne in mind that what the jury had to determine was, not the question of ante-nuptial misconduct, but the question of misconduct after marriage; and, when this is remembered, it seems clear that they must either have disbelieved Mrs. Shillito and pronounced her guilty of adultery, or have held, not indeed that her husband was untruthful—for he seemed to be an excellent man—but that he had not rightly understood what his wife said to him in a moment of great pain and excitement, and had wrongly supposed that she confessed to him her guilt, in which case they must have found for the respondent absolutely. The jury, however, did not take either of these views, almost inevitable though they seem. Carried away apparently by a desire to do substantial justice, they brought in one of the most extraordinary verdicts ever recorded in an English court of justice. After they had deliberated for an hour, their finding was, That the respondent had not committed adultery with the co-respondent, but that he had with her, and they assessed the damages against him at 1,000*l.* Strange to say, this verdict seems to have been accepted by the Judge.

Of its transparent absurdity it is not necessary to speak. This is so obvious that it would be a waste of words to expose it, and it is therefore happily unnecessary to dwell upon a singularly unpleasant subject. There can be no need to analyse a decision which is on the face of it self-contradictory, and indeed so preposterous that, were it not for the painful circumstances of the case, it might excite laughter. The jury might as well have found that two and two make five. Only on the supposition of violence or the administration of narcotics could such a verdict be reconciled with reason, and of either violence or narcotics there is not a hint in any report of the case that we have seen. The motives which induced the jurors to give such a judgment were no doubt most praiseworthy. They were not satisfied with the evidence against Mrs. Shillito, and they desired to punish the most loathsome malice. Unfortunately their well-meant effort has resulted, not in substantial justice, but in substantial injustice, while their verdict, apparently acquiesced in, attacks a vital principle of law. A moment's consideration will show

what grievous wrong results from the decision which was arrived at in this remarkable case. In the first place, it can hardly be said that it is fair to the unfortunate Mr. Shillito, whose conduct under the most trying circumstances appears to have been exemplary. Whatever may be thought of the conduct of others, there can be no doubt that he was free from blame, and yet he is left in a most disagreeable position, the peculiar and very painful nature of which is so obvious as to need no demonstration. Then Mrs. Shillito may be very hardly treated by the verdict. It is true that she is absolved; but she is absolved by a self-contradictory and incomprehensible decision; whereas she may have been entitled to a verdict in her favour without any mystifying rider. Her denial of the charge on which the jury had to pronounce may have been perfectly true, and in that case the finding respecting Hirst is clearly unjust to her. The result, therefore, of this attempt at substantial justice has been certainly to do wrong to one person, perhaps to do wrong to another. A graver objection, however, even than injustice to individuals can be urged against this mistaken decision. It infringes a fundamental principle of law. A man cannot be called upon to answer a definite charge and then have judgment given against him on a charge of a totally different nature. The jury were doubtless anxious to punish Hirst, and that his atrocious conduct deserved punishment no one will be inclined to dispute; but, utterly bad as he was, he should only have been punished according to law, and not by any distortion of the law. He was proceeded against on a charge of criminal intercourse with another man's wife, and of this he should have been pronounced innocent or guilty, without any regard to the expediency of punishing him for malignant statements. As a matter of fact, he was pronounced guilty of libel and punished for libel, the inconsistent verdict of which we have spoken serving to cover what was really a marvellous departure in the proceedings. That the man behaved in the vilest manner we need hardly say; and indeed a far more severe penalty than that imposed on him would not have been excessive; but nevertheless he should have been condemned in the right way or not at all. The escape of one culprit is a trifling matter when compared with a perversion of the law.

It may naturally be asked what view the Judge took of the case, and in answer it can only be said that Sir James Hannen's summing-up seems to have been singular in some respects, and to have suggested the verdict found; but that his remarks have apparently suffered more at the hands of the reporters than anything else said at the trial, and that it is impossible to ascertain with certainty what his views were. Very possibly, when a full report of the case appears, it will be seen that he has been altogether misunderstood.

THE P. R.

If any persons regret the "good old days" of the P. R. they need not despair, for there seems to be a kind of reaction growing in its favour. For some time past reprinted reports of old prize-fights—penned, it may be supposed, by the versatile and ingenious Pierce Egan and his compeers—have been current in a London newspaper; and now a more permanent tribute to the excellence of the cultivation of prize-fighting makes its appearance in the shape of a work called *Pugilistica*, "to be completed in 20 parts," the first of which is graced by a preface. The writer of this begins by announcing that he proposes to supply a blank in the home-records of the English people in the eighteenth and nineteenth centuries; and in his preface and introduction he is better than his word, and displays almost as much ingenuity as a daily leader-writer in dragging into his service all sorts and conditions of men and things of various times. The case of Michael Angelo and his broken nose is first brought in to illustrate the revival of "the art of self-defence as of other arts" in Italy after "the darkness of the middle ages." Then we have the story about Charles I. and Oliver Cromwell; and then we suddenly sink to a record, culled from Malcolm's *Manners and Customs of London*, which runs thus:—"Yesterday a match of boxing was performed before His Grace the Duke of Albemarle, between the Duke's footman and a butcher. The latter won the prize, as he hath done many before, being accounted, though but a little man, the best at that exercise in England." At first sight this might not seem a particularly strong instance in favour of the nobility of fisticuffs; but our author deduces no less than four points to be scored to him and his cause. It is a proof "1. Of ducal patronage. 2. Of a stake of money." (This, it may be thought, would have been better kept out of sight, especially as there is no specific mention of money in the extract.) "3. Of the custom of public boxing. 4. Of the skill of the victor, he 'being but a little man,' and all in a five-line paragraph." It is a little strange that a writer with so evident an appreciation of the merits of terseness should himself be so diffuse; but, no doubt, great deeds demand many and big words.

From the Duke's footman and the butcher we get on by rapid degrees to the late Sir Robert Peel, and the decadence, in the absence of "such patrons of pugilism," of the custom of prize-fighting. "The Ring," we are told, "was doomed, not less by the misconduct of its professors than by the discord and dishonest doings of its so-called patrons and their ruffianly followers, unchecked by the saving salt of sporting gentlemen and men of honour, courage, and standing in society." It is probably the dearth of this "saving salt" which leads the writer to say that "he would not seek to revive the 'glory' of the Ring that is past"; but has thought it a worthy task "to collect and preserve its memories and its deeds of fortitude, skill, courage, and forbearance." Before, however, we are allowed to become acquainted with the records of these noble deeds, we are favoured with an "Introduction" headed "Boxing and Boxers among the Ancients," in which we are reminded of the existence of such persons and things as Homer, Horace, "the sententious Cicero," Eryx, Antæus, Patroclus, Euryalus, Tydides, who "was Euryalus's second in the mill with Epeus," Entellus, Dares, Cloanthus, Gyges, the cæstus, the Abbé St. Non, Smith's *Antiquities of Greece and Rome*; Mr. Grantley Berkeley, St. Bernardine, Ariosto, the late Mr. Dowling, Forsyth's *Remarks during an Excursion in Italy*, the days of Alfred, and the battle of Waterloo. And all this in not a "five-line paragraph," but in twelve pages of which not more than four are extracts. And to all this the writer, when he plunges into his subject, modestly refers as "the poor scattered notices of pugilism as practised and understood by the earlier Celtic nations." He then goes on to observe with great truth that, "so long as man is liable to the imperfections of his nature, he will need the art of defending himself from attack and injury, and of redressing wrong or insult that may be offered to him." The proper weapons to be used on such occasions are, he thinks, "the *fists*—the symbol of personal courage, of prompt readiness for defence and attack—the most harmless, the ever-present, and the least fatal weapons." So far perhaps so good. The writer goes on in his next sentence to decry "the fatal *fleuret*" of "the fire-eating Gaul" (how many per cent. of French duels with the small-sword end fatally?); "the back-handed stiletto" of "the stabbing Italian"; and, which is more odd, "the slaughterous *schlager*" (*sic*) of "the beer-bemused *burschen* of dreamy Vaterland." On this there is a long foot-note, extracted from the *Sporting Life* of July 1863, which for certain reasons deserves attention. The extract gives an account of the student-duels at Heidelberg, to which reference has more than once been made in these columns. The writer of it first describes a sabre-duel between a cavalry officer and a student; and this description is remarkable for some of the oddest transcriber's or printer's blunders that have ever been seen. This duel took place in what readers are led to believe is called the *Ingle Suisse*, or Angels' Meadow. This should, of course, be Engel's Wiese. The seconds gave their directions in this manner:—"'Auf *de* (read *die*) mensur,' go into position and scratch, *Faretz* (read Fertig), ready, and Los, go at it." What, however, is of more importance to the writer both of this extract and of *Pugilistica* is the schläger (throughout miscalled schlager), duel, of which he gives this description:—

> It was on April 10, during vacation, and while there were scarcely any students in Heidelberg, I was sitting at my window, and saw four or five students go towards the *Hirsch Gasse*; I followed them, and when I arrived there the men were stripping. All being in readiness, they were led out of the house, each arm being carefully supported by the seconds. One of these gentlemen was a student from Munich, the other was a Heidelberger, and the men were placed opposite to each other. Silence was called, and the fight began. The first round occupied considerably less than half a minute, and was finished by the seconds springing in and terminating the round, because one of the *schlagers* was bent. The second round followed without any result. The combatants are never allowed to be in *mensur* more than three-quarters of a minute—scarcely ever half a minute: these short rounds are done to rest the arm. In the third round the Munich man got a cut on the cheek, a *Blutcher*, or "a blood," was the cry. The seconds cried "halt!" and "a blood" was scored to the Heidelberg student. The fourth round was a teazer for the Munich man, for he got his nose divided clean in two. No surgeon could have done it better; you could have laid one half back on one cheek, and the other half on the other. After this, the Munich man lost his nerve, and every round he only came up to be receiver-general. At last he got a fearful cut behind the head, dividing an artery. Seeing this, the surgeon immediately stopped the duel, after they had been at it seven minutes (fifteen minutes was the time they had to fight). The wounded man was taken inside the inn, where every necessary attention was paid him which his condition required. I never saw the man again.
>
> The second *schlager* duel which I saw was between a Prussian and a Schwabian: both fine men. The morning was a wet one, so they fought in a cart-shed. Having gone into a detailed account of two other duels, it will not be necessary for me to do so in this one; suffice it to say, the surgeon made them fight out the full time (fifteen minutes), and the Prussian got no less than six ugly cuts about the head; fearful gashes they were. He had to keep his bed; and, like most of these duellists, will carry the marks to the grave. As he was led out of the shed, he presented a piteous spectacle; and I only wish some of the detractors of the P. R. could have seen him as I did. These two *schlager* duels are good average samples.

It is true that the schläger duels are both excessively childish and excessively brutal. The author of *Pugilistica* calls them "sickening and murderous savageries." They are sickening and they are savage, but they are hardly ever murderous. They are got up between the members of two *corps*, just as a cricket match is got up in England between the members of two clubs, and it is seldom that they are preceded by a real quarrel. The blades used are something like a harlequin's bat with a sharp edge; and the face-wounds inflicted by them, though ugly enough to look at at the moment of infliction, do not generally involve more serious consequences than a razor-cut. A student may no doubt get such injuries as the writer describes; but that is the exception. Still, the practice is thoroughly detestable and barbarous—as vile, indeed, as the English boxing seems to the German student, trained to wield and endure the cuts of his thoroughly artificial weapon the schläger. But let us see how this method compares with that of the Prize Ring; and, for the present purpose, let us assume, what is not the

fact, that the two duels described are representative. We look at random through the pages of *Pugilistica*, and we find in p. 22 that "Broughton, when necessary in the conflict, by putting in his stomach blow, often decided the battle, and his lunge under the ear generally produced terrible consequences to his adversary." In p. 53 we hear of a certain Macdonald, who was "beaten so dreadfully that he gave in; that both eyes were closed, and it was found that his jaw was broken." In p. 59, "Ryan's head and eyes made a dreadful appearance"; and in p. 62, we have an exact parallel to the ugly incident of the schläger duel:—"Johnson . . . . caught him so severe and swift a blow in the face as laid his nose completely open." Odds (not unnaturally) "now rose 100 to 10 on Johnson."

On the whole, we may gather cheerfulness from these records in thinking that we are at least in some ways better than we were. On the other hand, while we agree with the virtuous sentiments of the collector of these annals concerning the undesirableness of reviving the P.R., it would certainly be unfortunate if boxing became a lost art. Possibly, as some say, there was less brutality in the way of murderous kicking assaults when "the art of self-defence" was more to the fore. Certainly some general knowledge of it might help to prevent the degrading exhibitions of personal cowardice of which a case lately reported is unhappily not a unique instance. In this particular case (one of too many like it) brought before the Marylebone police magistrate, an "excavator" named Jesse Palmer had gallantly gone to the rescue of a woman whose husband was trying to kill her with a knife. The husband and Palmer struggled; the husband aimed a blow at Palmer, and the knife fell on the ground. In Palmer's reported words, "a number of people came up at that moment" (when the assailant was unarmed), "and he (Palmer) asked them to help him, but they did not offer to do anything at all, and he believed they were all frightened of the prisoner." Possibly if some of the number had taken lessons from Donnelly they might have made a less shocking exhibition of dastardliness.

THE UNLIMITED BANKS AND THE NEW ACT.

THE success of the new Banking Act has been greater and more immediate than was at all expected when it was rushed through Parliament in the very closing week of the last Session. To secure its passing the Chancellor of the Exchequer had dropped some of its most important provisions; that, for example, creating a new class of banks under the name of Reserve Liability, and that imposing a uniform balance sheet. As the Bill was finally carried, it required all who registered under it to attach to their name the word "Limited," and many bankers have a very strong objection to do this. Their reasons are partly sentimental and partly practical; but, whether good or bad, it was feared that the objection would be powerful enough to render the Act nugatory. Many of them, moreover, hoped that such a hasty piece of legislation would be generally acknowledged to need early amendment, and the hope strengthened their inclination to watch and wait. The calming down of the alarm caused by the failure of the City of Glasgow Bank likewise encouraged the same course. As in so many previous cases, it was argued that the apprehensions of Bank shareholders in this instance also would gradually wear away. It was therefore not expected that a very great readiness to avail themselves of the provisions of the new Act would be shown by bank directors. The event, however, has fully justified those who advocated the adoption of a measure allowing the limitation of liability. Of the seven unlimited metropolitan and metropolitan and provincial banks five have already either resolved to register under the Act or are preparing to do so; while of the provincial unlimited banks a considerable number are also taking the same course. It is true that no Scotch or Irish bank has yet shown any inclination to take advantage of the Act. But there are special reasons in both cases accounting for this. Of the Scotch banks three are limited by charter, and yet, like the Bank of England, do not need to announce the fact in their names. Their competitors, whether rightly or wrongly, fear that if they were to "ticket" themselves, they would lose status in popular estimation. It must be admitted that their difficulty is a real one, and that it is quite reasonable they should ask that all Scotch banks should be placed on an equal footing. This being so, it is not at all surprising that they should wait in the hope of obtaining an amendment of the new Act. In the case of the Irish banks, again, there are some which have never yet published a balance sheet, and as a compulsory audit is part of the new Act, these, it need hardly be said, are not likely to adopt its provisions unless compelled to do so by their shareholders. While these hang back, their competitors naturally hesitate in the fear of losing caste with the public. Lastly, it was to be anticipated that the English provincial banks would but slowly and gradually come under the Act. For, as notice of the change has to be given to depositors, they would naturally dread the effect upon a class of persons generally timid, and too often ignorant as well. Here in London, and in other large towns, the public understand the import of the innovation, and are able to estimate the position of the institutions with which they deal. But in small towns and rural districts depositors are likely to be less well informed, and bank directors reasonably hesitate to take any step which might arouse their fears. Naturally, they will prepare the ground carefully before coming to a resolution. Yet, as we have already stated, a considerable number of provincial banks are taking measures to limit their liability.

In this matter the conduct of the great metropolitan and metropolitan and provincial banks is the most important, as in the long run it will determine that of all the others, and, as stated above, five out of the seven of these have either registered under the Act, or are preparing to do so. The Union Bank of London and the London Joint Stock for the present take up a waiting attitude. Both, indeed, express a desire for limitation of liability, but both object to the new Act as passed; especially they object to the obligation to write the word "Limited" after their names. Had the original proposal of the Chancellor of the Exchequer to create a new class of banks with the title of "Reserve Liability" been approved by Parliament, both would have availed themselves of the provisions of the Act, but, as this was not done, they remain unlimited for the present in the hope of further legislation. We hardly expect that this hope will be realized. Mr. Gladstone, indeed, some years ago threw out a hint that our whole banking system, including the right of private companies to issue notes, needed to be reconsidered; and it is possible that, if he were to return to power, and were to accept the charge of the finances he might attempt a vast and sweeping measure of reform. But whether the attempt would be successful is another question. And, in any event, it may be doubted whether the particular amendments desired by the Union and the London Joint Stock Banks would form any part of the scheme. But, until a change of Government takes place, it may safely be predicted, we think, that there will be no such further legislation. The very pertinacity with which the Chancellor of the Exchequer clung last Session to the portions of his Bill permitting the limitation of liability, while sacrificing all the rest, proves that he wished to have done with the matter once for all. The Bill, as a matter of fact, does satisfy the demand raised by the failure of the City of Glasgow Bank. The hope, then, in which these two banks are waiting seems a groundless one; and the objections stated against the Act do not appear to be more substantial. There is nothing to prevent the Union and the London Joint Stock Banks, if they choose, from adopting reserve liability; only, whether they do so or not, if they become limited, they must plainly state the fact in their title. We see no hardship in this. Why should banks more than other Companies think the word "Limited" derogatory to them, or shrink from describing themselves truly as they are? The Chairman of the Union Bank of London, indeed, argues that the reserve liability plan would have given us a uniform system of banking; but the *Statist* of last Saturday demonstrates very clearly that it would have done nothing of the kind; that, on the contrary, with a class of reserve liability banks the margin of liability would in some instances have been simply equal to the paid-up capital, whereas in others it would have exceeded that amount nineteen times. If uniformity is really of the value which Mr. Fergusson thinks, the Act as passed is preferable to the original Bill. The truth would seem to be that the objections stated at their shareholders' meetings by the chairmen of the Union and London Joint-Stock Banks to the new Act express only a part of the reasons which actuated them and their co-directors to refuse for the present to become limited. When the London and Westminster, the London and County, and the National Provincial do not fear that the tacking of the word "Limited" to their names will weaken their credit or lower their prestige, the Union and the London Joint-Stock need not be so fastidious. Certainly the National Provincial runs more risk, if risk there be, than either of them. We cannot wonder, therefore, that some of the shareholders were dissatisfied with the reasons assigned. They are obviously so insufficient that we are driven to conclude that the strongest motive is a desire to wait and see how the limitation of liability will affect competitors, before taking a step which could not be retraced.

The three great banks just named which have registered under the Act have not adopted a uniform system. The London and County and the National Provincial have each combined reserve liability with limitation; the London and Westminster has not. The latter institution has been able to do this because the nominal amount of its shares is 100*l.*, of which only 20*l.* is paid up. This leaves a margin of 80*l.* per share still uncalled, and the directors are of opinion that the margin affords all the security to creditors that can be desired. The London and County and the National Provincial, on the other hand, not having so great a margin, are compelled to adopt reserve liability. It would be tedious to enter into minute details; but, broadly stated, the result of the change in the three cases is as follows. The London and Westminster has a paid-up capital of 2,800,000*l.*, with a further callable capital of 11,200,000*l.*; the London and County has a paid-up capital of 2,000,000*l.*, with a callable capital of 2,000,000*l.*, and a reserve liability capital of 4,000,000*l.*; the National Provincial has a paid-up capital of 2,227,000*l.*, with a callable capital of 1,785,000*l.*, and a reserve liability capital of 8,025,000*l.* It will thus be seen that the London and Westminster has a total capital of all kinds of 14,000,000*l.*, the London and County of 8,000,000*l.*, and the National Provincial of 12,037,000*l.* But the whole capital of the London and Westminster can be called up, should the business of the bank require it, whereas half that of the London and County and two-thirds that of the National Provincial can only be called for purposes of winding-up. Applying to these figures the test suggested by Mr. John Dun a couple of months ago in a letter to the *Statist*, which we noticed at the time, we find

that the London and Westminster must lose 8,867,000*l.*, the London and County 5,666,000*l.*, and the National Provincial 7,620,000*l.*, before the creditors can suffer loss. It may safely be pronounced incredible that these enormous sums could be made away with before the banks were wound up, especially as the Act provides the safeguard of a compulsory audit. But while the solvency of all three institutions as limited banks appears unquestionable, many persons are inclined to regret that, were it only for the sake of the example, the London and Westminster has not adopted reserve liability. In the case of that great bank itself, the matter is of no practical importance; but it is urged that, as a general rule, a capital callable for the ordinary business of a bank, however large it may be, does not afford a perfectly satisfactory security to creditors. Growth of business, lock-ups, bad debts, may cause it gradually to disappear, or, at least, so much of it as to leave only a very narrow margin behind. But, where reserve liability is adopted, the bank cannot touch that. If it loses its paid-up and callable capital, it must close its doors, leaving the reserve liability capital to its creditors. Thus, in the three cases which we have been examining, the London and Westminster might conceivably call up the whole of the 11,200,000*l.* which is now uncalled, leaving nothing beyond to the creditors; but the London and County could call up only 2,000,000*l.*, leaving 4,000,000*l.* untouched, while the National Provincial must leave 8,000,000*l.* to its creditors. Of course it will be understood that we do not say this deeming it possible in the cases before us, but only to illustrate the advantages of reserve liability.

REVIEWS.

MEMOIRS OF METTERNICH.*

(*Second Notice.*)

THE despatches which form the second volume of the present publication are in some respects more instructive than Prince Metternich's later reminiscences. Almost all men who have accomplished considerable results imagine themselves, as they look back, to have foreseen or designed many things which were at the time produced or known by mere experience. The despatches which record from day to day Metternich's conversations with Napoleon, and his own conjectures and schemes, are naturally less positive and less consistent than his policy as it is retrospectively described in the Memoirs. He professed in the interview at Dresden to agree with Napoleon that the Austrian marriage had been a blunder, though neither of them explained the reasons of their opinions. It would seem from the despatches that Metternich, if he was not the author of the arrangement, was entirely satisfied with the marriage, on the ground that it seemed likely to secure an interval of peace for the recovery of Austria from military and financial prostration. In 1809 Napoleon's insulting language indicated a purpose of dividing the Empire into three or four separate States, under relatives or dependents of his own. From the date of his marriage to the rupture of 1813, he neither made nor apparently designed any attack on the dominions of his father-in-law. During that time Metternich's chief uneasiness arose from his doubts as to the nature and permanence of the understanding which had been formed between Napoleon and Alexander I. at Tilsit and Erfurt. His reports to the Emperor Francis confirm his own subsequent account of the sagacity with which he discerned in 1810 the approaching rupture with Russia. A less cautious statesman would probably have made his discovery a reason for allying himself with the weaker party. The elder Metternich, who administered the Foreign Office during his son's absence in Paris, had before his return agreed with Count Schouvaloff, then on a mission to Vienna, on the draft of a treaty with Russia. Metternich without hesitation set the project aside, and continued till the beginning of the Russian war to negotiate with both the rival Powers. He steadily resisted the repeated proposals of Napoleon that Austria should seek compensation for territorial losses at the expense of Turkey; but he listened more favourably to overtures for an exchange of a portion of Galicia for Illyria and some of the other provinces which had been lost by Austria in former wars. On the other side he cultivated friendly relations with the Court of Prussia, and when the war began he effected the anomalous objects of furnishing a contingent to the invading army and at the same time maintaining neutrality with Russia. Prince Schwartzenberg's force, which formed the extreme right of the grand army, never during the campaign received an order from Napoleon; nor was there any collision with the enemy, who was also a neutral. The contingent was intended to serve another purpose, which was attained after the retreat from Moscow; Schwartzenberg, when he retired from Lithuania, took a position on the North-Eastern frontier of Austria, to prepare, with reinforcements which were hurried forward from all the provinces of the Empire, for armed mediation and for ultimate intervention. The contingent had, to Napoleon's surprise, been formed of the *cadres* of many regiments; so that, when it became the nucleus of a great army, its numbers admitted of rapid increase. Metternich foresaw the obstinacy with which Napoleon rejected every compromise, but he was firmly resolved not to engage in the war prematurely. He knew that the Russian army wished to retire within its own frontier; and he frequently expresses the opinion that, if Kutusoff had lived, it would never have crossed the Polish border. For the Prussian army, consisting chiefly of recruits, he entertained an undue contempt; and he justly distrusted the King, who had long obeyed Napoleon with the subserviency of habitual fear. At Metternich's request, the Emperor Francis joined his army at a point half-way between the camp of the allies and Napoleon's headquarters, at Dresden. Having heard that Metternich had met Alexander at a place called Opocno, Napoleon invited him to Dresden, where they held the famous conversation which lasted from eleven in the morning to eight at night. The occasion was so far unfavourable to peace that Napoleon's confidence had been revived by the defeat of the Prussians at Lützen and of the Russians at Bautzen. He more than once assured Metternich that he would meet him in a few months at Vienna. "Your soldiers," said the Minister, "are mere children, and if this juvenile army should be swept away, what will happen?" In a phrase easy to conjecture, but so coarse that it could not be literally quoted, the Emperor answered, "A man such as I am does not concern himself much about the lives of a million of men." "Why," replied Metternich, "do you say this to me in private, and not within the hearing of France? Our cause would not lose thereby." Napoleon, seeing the mistake which he had made, attempted to retrieve it by a grosser blunder. The French, he said, had no reason to complain, because to spare them he had sacrificed the Germans and the Poles. Out of 300,000 men lost in the Russian campaign, he asserted that only 30,000 were Frenchmen. "You forget, sire," exclaimed Metternich, "that you are speaking to a German." Both on arriving and on leaving, Metternich found the ante-chamber crowded with generals; and Berthier, of all Napoleon's lieutenants perhaps the most devoted to his chief, entreated him as he entered to make peace, which, he said, France required. On his departure Berthier anxiously inquired whether Metternich was satisfied. "Yes," he said; "he has explained everything to me; it is all over with the man."

Metternich was present with the allied sovereigns on the field of Leipsic, and he took the principal part in the arrangement of the plan of the next campaign, which was settled at Frankfort. Napoleon recognized his hand in the offer which the Allies publicly made, by the Austrian declaration of war, of the Rhine, the Alps, and the Pyrenees as the boundaries of France. "No one," said the Emperor, "who knew the French character less thoroughly than Metternich would have thought of the phrase." It is possible that Metternich afterwards exaggerated to himself the certainty which he represents himself as having felt as to the refusal by Napoleon of all tolerable conditions of peace. The harsher terms which were required at the Conference of Chatillon were also intended by Metternich to be rejected. As soon as the fall of Napoleon became imminent, Metternich, cordially supported by Lord Castlereagh, determined on the restoration of the Bourbons, in opposition to the fantastic schemes of the Emperor of Russia. Alexander stole a march upon him by concluding the treaty of Fontainebleau before Metternich's arrival in Paris. The Austrian Minister utterly disapproved of the selection of Elba as the place of Napoleon's residence, and the Emperor Francis dwelt on the grievance of the separation of the island from the Duchy of Tuscany. Nevertheless he found it necessary to acquiesce. In a letter to the Emperor Francis, Metternich mentions that at a dinner at Talleyrand's he had met Marshals Ney, Macdonald, Marmont, Lefebre, and General Dessoles, who were unanimous in their excited feelings against Napoleon. "Marshal Macdonald," he says in another letter, "declares that Napoleon has not two connected ideas." "The Marshals have declared that Napoleon should die if he does not abdicate, and in the opposite case they would immediately join the banner of Louis XVIII." Ney was at the time acting as one of Napoleon's plenipotentiaries. His violence in 1814 proceeded from the same weakness of character which in the following year caused his ruin. An account of the negotiations which resulted in the Peace of Paris by the first of European diplomatists would have been highly valuable; but Prince Metternich devotes only two or three pages to the most important treaty of the time. On the Congress of Vienna he is somewhat more communicative, and the scantiness of his narrative is in some degree corrected in the form of a memoir written by his confidential assistant Gentz, for whom he had procured the appointment of secretary to the Congress.

Perhaps the most interesting parts of Metternich's Memoirs are the judgments which he delivers on the characters of some of the sovereigns and statesmen whom he had known. His elaborate criticisms, written at a later period, sometimes differ from the opinions which he had expressed in contemporary despatches. To Talleyrand he attributes great intellectual power; but he thinks that he was most successful in preventing any definite course from being taken. "In the contrary direction I never could discover equal ability." Napoleon once said to Metternich, "If I want anything done I do not employ the Prince of Benevento; I turn to him when I want a thing not to be done which I wish to appear to want." Like most paradoxes Napoleon's statement was greatly exaggerated. He had not employed Talleyrand for years as his Foreign Minister for merely negative purposes. In later years Talleyrand's faculty of hindrance was exerted with surprising boldness; but not at the instance of the Emperor. At Erfurt he said to Alexander, "Sire, what are you going to do here? It rests with you to save Europe, and you can accomplish this

* *Memoirs of Prince Metternich*, 1773–1815. Edited by Prince Richard Metternich. Translated by Mrs. Alexander Napier. 2 vols. London: Richard Bentley & Son. 1880.

resisting Napoleon. The French people are civilized, its Sovereign is not. The Sovereign of Russia is civilized, and his people are not. It is therefore for the Sovereign of Russia to be allied with the French people." Metternich also states that, at another interview with Alexander, Talleyrand said "The Rhine, the Alps, and the Pyrenees are the conquests of France. The rest are the conquests of the Emperor of France, and we shall not hold them." About the same time Talleyrand repeatedly urged Metternich to form an alliance with Russia against Napoleon in the interest of France. It is difficult to judge whether his conduct is more properly to be called patriotism or treason. For Talleyrand's successor, Champagny, Metternich expresses dislike and contempt. His judgment of Fouché's ability and absence of scruple confirms the common opinion. The most important of his negotiations during his residence at Paris were conducted with the Emperor himself. On his first interview an unfavourable impression was produced by Napoleon's ungraceful figure, and endeavour to make an imposing effect; but he found that conversation with him "had a charm difficult to define." He always seized the essential point of the subject, "finding the fitting word for the thing, or inventing it where the usage of the language had not created it." In action also "ordinary rules did not embarrass him; in practice, as in discussion, he went straight to the end in view." In the historical discussions to which he frequently turned the conversation he betrayed his imperfect knowledge of facts, "but an extreme sagacity in appreciating causes and foreseeing consequences." Metternich held that in a certain sense Napoleon was not irreligious; and it is certain that he detested the French philosophers of the eighteenth century, and especially Voltaire. For legitimate succession he had an envious respect. Metternich once told Charles X. that Napoleon said to him at St. Cloud, "Do you know why Louis XVIII. is not sitting in this chair? It is only because I am here." For his followers he had no other regard "than a foreman in a manufactory for his workpeople." Duroc, he said, loved him as a dog loves its master; and Berthier as a nurse loves a child. His courage scarcely needed discussion, though, according to Metternich, he was most tenacious of life. "The history of his campaigns suffices to prove that he was always at the place, dangerous or not, which was most proper for the head of a great army." "In private life, without being amiable, he was good-natured, and even carried indulgence to the point of weakness." The Empress Maria Louisa said to Metternich soon after her marriage, "I have no fear of Napoleon, but I begin to think he is afraid of me." The question whether Napoleon was good or bad seems to Metternich inapplicable to his character. If there were a neutral land where morality and immorality were equally non-existent, it would be his proper dwelling-place. He crushed his enemies, but he bore them no malice, and he pursued his objects without reference to right or wrong. A judge lately told a jury that by the law of England every man is sane or insane. Unless the ethical law is more elastic, Napoleon must be placed on the wrong side of the border.

Of Alexander, with whom his personal relations had sometimes been less amicable, Metternich makes a still more careful study. During the Congress of Vienna the Emperor Francis one day sent for his Minister to inform him that Alexander had announced to the Emperor his determination to challenge Metternich to a duel. Francis II. pointed out the strangeness of the proceeding, but finally said that he had no doubt the challenge would be accepted. A partial explanation averted the duel, but during the remainder of the Congress the Emperor of Russia refused to hold private intercourse with Metternich. A meeting, rendered necessary by the escape of Napoleon from Elba, ostensibly put an end to the quarrel. Gentz says that when Alexander arrived at Vienna he was already embroiled with Austria, France, and England. His displeasure with Austria was really directed against Metternich, who had rejected the Emperor's proposal that he should be generalissimo of the allied armies, with Moreau as the chief of his staff. Another ground of offence was the refusal of Metternich and Schwartzenberg to be bound by a promise made by Alexander to a Swiss lady, who had been his sister's governess, that the allied armies should not enter the territory of Switzerland. At Vienna, Metternich, in concert with Castlereagh and Talleyrand, opposed the annexation of the Duchy of Warsaw to Russia, and the acquisition by Prussia of the kingdom of Saxony. Alexander had reason for attributing the real direction of Austrian policy to Metternich, and he avoided personal collision with Francis II., for whom he felt sincere attachment and respect. In the intervals of their dissensions Metternich had an intimate acquaintance with Alexander, and he seems to have understood his shallow and unstable character. Of the project and conclusion of the Holy Alliance he speaks with unqualified contempt. He tells, not for the first time, the story of Alexander's request to Lord Grey for a plan of an Opposition in Russia. Lord Grey naturally asked whether the Emperor intended to establish a Russian Parliament; in that case he might spare himself the trouble of inventing an Opposition. Napoleon once described, with characteristic subtlety, one of Alexander's fundamental deficiencies:—"There is something in him for which I have no name, and which I cannot better express than by saying that there is always something wanting in him. The most singular thing is that one cannot foresee in any given case or special affair what will be wanting, because that which is wanting changes perpetually."

No space is left to notice many other matters of historical interest, including the reciprocal antipathy produced by differences of opinion, of policy, and of temperament between Metternich and Stein. The want of an index is extremely inconvenient. The translation, both from French and German, is easy and idiomatic, though several passages require correction. The statement that in 1808 Napoleon had made peace with England is a strange as one of the terms of the supposed treaty, which provides that *Bragansia* shall be restored to Portugal. In the original the terms are perhaps those which Napoleon was willing to offer, including the restoration of Portugal to the House of Braganza.

THE GREAT AFRICAN ISLAND.*

MADAGASCAR has been the subject of several interesting volumes. Mr. Sibree's own publication in 1870 of a work he entitled *Madagascar and its People*, and Mr. Ellis's *Three Visits to Madagascar* of earlier date, drew attention to a very strange land and a stranger people. But there has been no such comprehensive account of both in all their various aspects as the present. Without pretending to scientific knowledge Mr. Sibree puts very clearly the problems which the island suggests both to the naturalist and to the ethnologist. From the point of view of the former, Madagascar is as remarkable for its deficiencies as for its riches. Near, comparatively speaking, as it is to Africa, and broad as is the belt of forest which surrounds the island in an almost unbroken line, it has no lions, leopards, elephants, monkeys, zebras, or giraffes, and no hoofed animals, except a species of river hog. The special occupants of its tropical woods are the lemurs, which in Africa are unknown. Mr. Sibree seems rather ashamed at having to avow that, "with two or three exceptions, the serpents of Madagascar are harmless." As, however, one of his missionary brethren describes as "a medium-sized specimen" one which was almost nine feet long, and as thick round the middle as the calf of a man's leg, he ought to be fairly content. Many reptiles live on the summits of gigantic trees above the reach of explorers. Mr. Sibree regrets that naturalists do not take advantage of a cyclone for their researches. Titans of the forest are then levelled, and whole tribes of arboreal reptiles can be studied without labour. In the vegetable kingdom, palms and ferns of various kinds appear to be the most conspicuous products of Madagascar. But its botanical curiosities would seem to have been not more fully examined than its animals. Mr. Sibree dwells with especial admiration on the Traveller's tree, which grows in the forest to a height of ninety feet. Its name is derived from the supply of water which can be obtained by piercing or pulling out a leaf stalk. The same tree grows, says Mr. Sibree, under the name of the fan palm, in the Malay Peninsula. On the original relationship between Madagascar and Malaysia which is indicated in some measure by the flora, and still more by the fauna, of the former, Mr. Sibree quotes, not with absolute assent, but with a certain approval, the remarkable hypothesis constructed by several naturalists, of the existence of a lost continent, named by Mr. Sclater Lemuria, to which Madagascar and Malaysia are supposed to have both belonged. The coral reefs of the region are a sign that the surviving islands belong to the class called by Mr. Darwin sinking lands. Physiology, according to Mr. Sibree, tells the same tale. The Malagasy, after allowing for casual intermixture with negroes and Arabs, are, he is of opinion, clearly of Malay extraction. Their features and hair are Malay, not negro, and their language seems to him to point to the same conclusion. A reputed Hova skull, on which supporters of the theory of an African lineage for the islanders rely, is, he thinks, probably that of a slave. He doubts whether a genuine Hova skull could be readily procured, the Hovas, who are the ruling Madagascar people, preferring to keep their skulls for themselves. At all events, the evidence of language is incapable of being counterfeited; and that, for reasons which we have no space to reproduce, he holds to be decidedly in favour of a Malay origin.

The Malagasy language has an interest independent of the ethnological propositions which it helps to prove. Mr. Sibree considers it an easy tongue on account of the simplicity of the grammar. There is also no fresh character to learn, as the island had no written language before Europeans, who happily were not Germans, taught them the use of letters. He maintains that, although the early Jesuits made some slight attempts to prepare books, the written form of the language in use is due really to the London Missionary Society. The language has some especial deficiencies. Mr. Sibree states that it has no plural form, though in one place he incidentally mentions that the men of a certain Malagasy tribe object strongly to be addressed in the singular. In some other respects the language is meagre. But in one particular its resources are exceptionally great. It contains a complete numeral system up to a million. That the word for a million signifies the finishing of counting can hardly be matter of complaint. A special difficulty for students is that a large number of words which were good Malagasy in one generation become obsolete in the next. When a chief assumes, as he commonly does on his accession to power, the name of a quadruped, bird, or tree, that word becomes among his dependents sacred and tabooed for everyday use. It can no longer be applied

---

* *The Great African Island: Chapters on Madagascar.* By the Rev. James Sibree, Junr. With Maps and Illustrations. London: Trübner & Co. 1880.

in its proper sense. Thus Mr. Sibree has known the common name for a crocodile, "mamba," to be laid aside in the dominions of a chieftain who was called Andriamamba. If the sovereign of the Hovas, who governs two-thirds of the island, takes a common name, the inconvenience is infinitely greater. The late Queen assumed the name of Rasoherina. As the last four syllables mean a silkworm, it became forthwith necessary to rechristen the silkworm zana-dandy, which signifies "offspring of the silk." As, when the sovereign of another powerful Malagasy tribe dies, he receives a new name, which is equally sacred, the difficulty only shifts. Other words have dropped out of the language through changes in customs. Many were used in connexion with divination, charms, and magical rites which Christianity has displaced. Thus, says Mr. Sibree, "the dictionary of the first missionaries will be to succeeding generations a kind of museum where alone they will find relics of the superstitions of their fathers." On the other hand, the same force of Christianity and civilization which has been destroying has been building up. Not only all the words denoting Christian rites are English, but so are most of the terms expressing grades in government, such as Prime Minister, and ranks and words of command in the army. Of the same extraction are nearly all terms which have to do with education and civilization. Such other evidences of intellectual culture as Malagasy embodies appear to be derived from the old Arab intercourse, which by many centuries preceded that of Europe, with Madagascar.

When the native intellect has created a new word, it is sure to be very significant. Thus a turkey is known by a combination which means "the not terrible bird." Probably the first turkey ever seen excited alarm by its crest and gobbling noise. When its helplessness was discovered, language avenged the panic. The people, having abundant leisure, let their imagination have free play in the coinage of words. The sun is called "the eye of day." The term for glory is "the flower of the grass.' The army is known as "needles of the kingdom, and wetted thread to bind it together." The people style the sovereign, and she by a far less usual courtesy styles them, "father-and-mother." The general application of this term to superiors has sometimes, according to Mr. Sibree, given a more political character to Christianity than was intended. The early missionaries rendered in the Fifth Commandment the words "father and mother" by this Malagasy term for parents. The result was that some loyal native preachers have been in the habit of making it a text for obedience to the Government. Between the word for girl in many tribes and the old English expression for an unmarried girl there is a close analogy. The Malagasy word means "spindle-child." The word for a child dying under two years of age will recall Keats's epitaph on himself. It is "rano," the word for water. Living youths are spoken of as "in the cream of it." Occasionally a moral sentiment is conveyed by a word. Thus the word for hypocrisy means "the becoming good by spreading a mat." In a Malagasy house the floor is seldom if ever cleaned; but when a visitor appears he is honoured by a clean mat being laid over the accumulated filth. Another word embodies, Mr. Sibree thinks, immorality rather than morality. He is very indignant that the act of divorce which a Hova husband can perform by merely sending to his wife a piece of money is called "thanking a wife." The act is doubtless a very bad act; but we do not know that it is made worse by "calling it by a fine name." The Hova thanks his wife for the rejected offer of her future company as the *table-d'hôte* guest thanks a waiter for the dish he passes by. Royal personages in Europe accumulate on their children baptismal names which would be a heavy infliction were they to become chief clerks in the Bank of England, but they are outdone in Madagascar. A recent Madagascar Queen had twelve syllables to her name, and a former Prime Minister ten. At one time it was the habit to prefix a baptismal name to a Malagasy who became a Christian. More lately Protestant missionaries have abandoned the practice, from the fear, we presume, of awakening political suspicion of an alien allegiance. A sufficient reason might have been the objection to increase even by a syllable the labours of human life. The names are often significant of supposed magnificent qualities. But contumelious names are not rare. Thus one high official is known as "Dunghill." The motive is the universal fear of exciting envy. It is common, Mr. Sibree says, if a stranger casually remarks that a child is pretty, for the relatives to reply, "No, it is ugly." Possibly something of this same dread of concentrating the attention of the powers of evil on a particular person may mingle with the sentiment of awe or politeness which makes it indecorous to utter, not only the sovereign's name lightly, but the name of any Malagasy "without making an elaborate apology for doing so." It is not hard to comprehend that a nation with such habits of constructing long words, and apologising in others still longer for not using them, is a nation of "ready and fluent speakers." "Almost all Malagasy," declares Mr. Sibree, "are born orators." He adds, "although"—we should have said "therefore"—"they certainly have also the power of saying a great deal without conveying a clear idea of what they mean." It is terrible to hear that to rhetoric they have lately added logic. Mr. Sibree says that an elementary Logic has become "a very popular work."

Life among the Malagasy is easy. There is not great wealth; but neither is there poverty. Mr. Sibree says that the country, were it properly tilled, could sustain a population from ten to twenty times its present three or four millions. We scarcely see that the total of happiness in Madagascar would be thereby greatly increased. In many respects Mr. Sibree testifies to the existence of so much practical prosperity in the island—at any rate so far as the sway of the Hova Crown extends—that we should be glad could the present condition of things continue. He reckons each missionary as representing in Polynesia a value to European and American commerce of 10,000*l.* a year. "In Madagascar perhaps it would not be too much to say that each missionary represents a value of from 2,000*l.* to 3,000*l.* per annum of foreign imports. . . . So true it always is that Christianity is the best civilizer and the harbinger of all honest trade." This may be a good argument at Manchester in the mouth of a travelling secretary of the London Missionary Society; but we do not know that Madagascar need envy Polynesia in this respect. We are glad to admit that Christian missionaries, not of the London Missionary Society alone, must be credited with having worked much good to Madagascar. They have abated infanticide and some of the worst horrors of war. They have shamed into secrecy the cruel superstitions connected with divination and charms. They have promoted, at all events, external modesty and sobriety. But their success is attributable in part to the very fact that European commerce has been slow to take advantage of the opening which missionaries have made. The Hova kingdom is in the happy state as yet of having Christianity to veto and prune down customs which degrade and brutalize, without the counter influence of an alien civilization to act as a universal solvent. Mr. Sibree's own account of Malagasy institutions indicates an elaborate and deep-rooted system, which might be overthrown but could not so easily be replaced. Hitherto Christian missionaries, conscious that they are left to deal alone with the native rulers, have contented themselves with interposing at the point at which a usage has degenerated into brutality or license. Did they know themselves to be supported by a powerful trading community we are not altogether sure but that they might attempt to import European institutions wholesale. As Mr. Sibree confesses, the extraordinary spread of Christianity through the Hova kingdom during the last sixteen years, and especially since the accession of Queen Rànavàlona in 1868, is due to the fact that the Government has been on the side of the new religion. "A vast proportion of the new converts would have probably become Roman Catholics, or even Mahometans, with almost equal readiness had their rulers favoured those forms of religion." That is not very satisfactory so far as the converts are concerned. But it is well that the missionaries themselves should feel indebted to a protection which binds them to respect a very remarkable national type. Such a sentiment Mr. Sibree himself shows to be entirely compatible with successful protests against the evil phases of Malagasy customs. The problem for missionaries in Madagascar is how to humanize those customs without involving good and bad in one common condemnation.

In solving this difficulty they may learn also how to release Malagasy life from an accretion of traditions and social distinctions which must go near to suffocating all energy. Everywhere in Madagascar life is broken up into sections and fenced about with forms which have lost their meaning. Thus there is the hereditary noblesse, the Andrians. They are buried in tombs different from those of the commonalty. Some of them may carry a scarlet umbrella. The highest grades may marry out of their own rank, though the inferior grades may not. For others the point of honour is that they may not mend a fence. None of them have any more prescriptive right than German nobles or Magyars to occupy State offices. The present Prime Minister, for instance, is not an Andrian, though his family has been wealthy and powerful for several generations. Andrians are often poor enough to be day labourers. One sept of them monopolizes the craft of making tinware. The sovereign is the single sun and centre of Malagasy society. When bricklayers' work has to be done in the Queen's palaces, "all ranks of the people, from the highest to the lowest, take a pride in doing with their hands some of the actual labour, under the eye of their Queen, who sits on a raised seat looking on." The sovereign is an autocrat. The lives and property of all her subjects are at her absolute disposal. It is death even to block the way to her cattle. But she is as much a slave to the ceremonial which environs her as her subjects are slaves to her caprices. She may not move except with an enormous retinue to escort her. On her progresses twenty to thirty thousand attend her. To walk is almost forbidden. From the great New Year's festival which she celebrates by majestically bathing in a silver bath, only screened from view of her Court by the silken mantles her attendants hold, to the moment when her royal corpse is yet more majestically interred, she is a figure in an often rehearsed pageant. The punctiliously regulated life of the sovereign is only an extreme illustration of the minute observances which encompass Malagasy life in all ranks. The best part of a Malagasy's year is robbed from him by a division of days into lucky and unlucky. Out of the twenty-eight days of a month twelve only are lucky. Some months are altogether unlucky. Children born in one month, or on certain days of others, were, until the missionaries interfered, put to death. "The new-born infant's head was placed face downwards in a shallow wooden dish filled with lukewarm water." In one Malagasy tribe a child born on a day of ill omen is buried alive in an ant-hill. The Hovas love their children, yet all infants born in an unlucky month had formerly to be laid down at

the entrance of the village cattlefold, that the oxen might be driven over them. The present Prime Minister survived this ordeal of hoofs and horns. The superstitions connected with burial are still more artificial and vexatious. A Hova whose house cost him ten dollars will spend a couple of hundred on a tomb. All sorts of fantastic forms, some of them exceedingly horrible, are employed when a funeral is solemnized. It is hardly affection which dictates them, but fear. The dead is supposed vaguely still to live and to have a ghost's power of haunting the living. The spirits of Malagasy monarchs are believed to make their abode in a lofty mountain called Ambondrombé. The neighbouring population fancies it hears the firing of cannon by way of salute whenever a royal ghost arrives to take up his abode in this gloomy Olympus.

We have been able to instance only a few of the many curious facts Mr. Sibree has collected. Our readers must go to him to learn how, according to the popular Malagasy doctrine, crocodiles habitually graze on pebbles, and eat oxen and men only by way of a whet; how ants kidnap serpents and cage them till they are fattened to the desired point; and how a Hova, very prudently, is more respectful to his mother-in-law than to his wife. We must also refer to the volume itself those who are curious on Malagasy painting, and carving, and architecture, and agriculture. We shall have effected our purpose, as Mr. Sibree will have effected his, if attention shall have been recalled to a very peculiar type, whether of civilization or of regulated barbarism, and to the interesting experiment of a body of Christian evangelists left to deal by their own unaided resources, not with a mere medley of isolated tribes, but with a powerful throne and a highly elaborate nationality.

HOUGHTON'S NATURAL HISTORY OF THE ANCIENTS.*

THE modest title of *Gleanings*, prefixed to Mr. Houghton's little work on natural history as known to the ancients, is intended, he explains, as a disclaimer of any intention of entering upon so wide a field as that subject would present if considered as a whole. Not a few lectures merely, but an encyclopædic volume, would be needed to give even in an abridged form a systematic view of natural history from the earliest times, even excluding altogether the botanical department of the inquiry, and limiting attention to what was known of the animal kingdom. Nor does Mr. Houghton propose to take his readers back to the earliest relations between man and the lower animals, as they may be traced by the juxtaposition of their remains in caves, kitchen middens, pile-dwellings, or other sources of knowledge prior to the dawn of written history. We are not to look to him for new light upon the stage of incipient civilization at which our rude and remote forefathers first made animals of use for other purposes than food, or to learn at what date the instincts of the dog were brought into use and trained for his master's service in the chase, or for carrying and drawing burdens. How long was it before sheep were gathered and tended in droves, and made to follow the wandering tribes in search of fresher pastures or more copious streams? When was it that the noblest conquest, as Buffon has taught us to regard it, that man has ever made, broke in the horse as his most efficient aid for transport and for war? Problems touching these obscure and rudimentary points of natural history still await the solution of the more scientific natural historian or palæontologist. As the popular expositor of what has been fairly well ascertained by zoological research, or is to be made out by critical study of the records of antiquity, Mr. Houghton has limited his notice to such animals as were familiarly known to the inhabitants of Egypt, Palestine, Assyria, Greece, and Rome from the earliest period of written history down to about the middle of the third century of the Christian era.

The sources on which our author has drawn for his information are in the main fourfold:—1. Natural history; 2. Literary history; 3. Figures of animals on monuments, coins, gems, &c.; 4. Names of animals. Within the range of time embraced by his inquiries there has been no discoverable break between the animal species disclosed by the earliest records and those found alive at the present day. In fact, as Mr. Houghton urges, such evidence as may be supplied unconsciously by prehistoric accounts may be more valuable to us than descriptions of animals in literary history. In the latter case, for instance, the authorities may make loose and inaccurate statements, perchance from hearsay, as to the occurrence of certain animals in particular places, their nature or habits; whereas the evidence of a pile-dwelling, a kitchen midden, or a bone graven with the image of a horse, a reindeer, or a mammoth, forms incontrovertible proof of the presence, be the period what it may, of such and such living forms upon the spot. For the literary material of our inquiry we begin with the records of the Old and New Testaments, with the Egyptian monuments and the lately deciphered cuneiform and bilingual texts exhibiting the names of animals known to the early Assyrians and Akkadians. Amongst classical writers the only approximation to anything like a system of zoology is Aristotle's well-known History of Animals, a work surprising for its width of knowledge and as a monument of diligent research, but, when tried by modern standards, lacking in scientific arrangement, and mixed with a vast amount of fable and error. In justice, however, to the great Stagirite, it must be allowed that his text has undergone an incalculable amount of tampering or falsification, and that, as regards many fundamental principles of biology, the judgment of experts like Professor Huxley has gone far towards vindicating as well his method of investigation as his exact appreciation of natural truth. Whatever ground may be afforded by many portions of what passes as Aristotle's work for the disparaging remarks of Mr. G. H. Lewes and other critics, the great Greek philosopher is not to be denied the credit of having anticipated by the keenness of his insight and the exactitude of his observation not a few of what have often been set up as discoveries of modern times.

Linguistic palæontology—a phrase borrowed from Professor Rolleston—or the evidence supplied by the names of animals, forms another source of information. Words have been well called fossil thoughts, and from the name of an animal in popular use we may derive a valuable clue to its identification or to a knowledge of its chief characteristics. What an admirable name, our author instances, is "flitter-mouse" for one of the commonest of our bats. The porcupine is the "pig-like creature armed with spines"; the Greek rhinoceros is "the animal with a horn on its nose." The squirrel—in Greek *σκίουρος*, "shadow-tail"—must clearly, he remarks, have sat for his name-portrait. Sometimes the name may speak to us of the country whence the animal originally came. Thus the Akkadian name for horse is "the beast of burden from the East"—*i.e.* Media and Armenia; the camel is "the beast of burden from the sea," the sea being the Persian Gulf across which the "ship of the desert" was brought to the Mesopotamian valley from its original home in Arabia. In Akkadian one name for wolf means "high-land"—*i.e.* the mountain district of Elam; the ravenous nature of this wild carnivore being expressed by another name which in English would read "the beast that eats like a dog," or the ravening beast. The first class of animals taken up by our author is that of the *Simiadæ*, or apes and monkeys, as known to the ancients. A conspicuous place in Egyptian mythology was held by the baboon (*Cynocephalus hamadryas*), a species not now found in Egypt, but the only one it would seem known there in early times. It is found often in large groups in Abyssinia and Arabia. This large and wise-looking ape was sacred to Thoth, the lord of letters or Egyptian Mercury. It is not unfrequently depicted seated above the balance in which the soul of the departed is weighed, or in the boat in which a wicked soul is sent back to earth from the presence of Osiris. Other monkeys, apparently some kind of *circopithecus*, occur upon the monuments as tribute to Egyptian monarchs. They are often found embalmed, and are known to have been held in religious reverence. No species of monkey is known to have been indigenous in Palestine. The word used in Scripture for the ape, *kōph*, is not Hebrew, but, like those for ivory (*shēn-hābbīm*, tooth of elephant, from the Sanskrit *ibha*) and peacocks (*tūkkiyīm*), found in combination with it in 1 Kings x. 22, derived from the Sanskrit *kapi*, in Greek *κῆβος*. It was most probably from India that Solomon drew these imports, as well as the almug ("algum") or sandal wood, a native of the mountainous parts of Malabar, though some, reading ostriches for peacocks, look to the eastern coast of Africa as the source of supply. In the Assyrian name for a monkey, *udumu*, it is easy to recognize the Hebrew word, *adam*, for a man.

In the Periplus of Hanno we come upon the name and the characteristics of the African gorilla. To what extent the ancients were able to distinguish between this and other varieties of the anthropoid ape we have no means of determining with any degree of accuracy. Aristotle speaks of three tribes of *simiadæ*—*pithecoi*, *keboi*, and *cynocephaloi*, the *pithecus* being a tailless species, the *kebos* having a tail, and the *cynocephalos* being a dog-headed baboon, corresponding with the designation of modern zoologists. Mr. Houghton has brought together from Pliny, Cicero, and other writers, a variety of notices illustrating the regard, and even religious reverence, in which monkeys of different kinds were held in Rome, and the prices paid for household pets. Not less curious and ample are the notices of the dog, carried back to the earliest times. On the Egyptian monuments the dog has very much the character of the Dalmatian hound or the Eskimo breed. One of the names used for it, *uńsu* or *uńsau*, "wolves," seems to favour the idea of the dog being derived from the domesticated wolf or jackal. In a letter of the nineteenth dynasty, translated by Dr. Birch, large packs of hounds are spoken of—200 of the kind called *unu*, and 300 more *uńsu*, in all 500. Many were pied or spotted, and show somewhat of the greyhound form. The oldest shown by the monuments is a house dog, of the time of Cheops, bound by a cord to his master's chair. The mastiff—never seen in Egypt—is vigorously drawn in several of the Assyrian bas-reliefs, of which our author gives a capital specimen from the British Museum. He considers it to have been allied to the Indian dog, known to Alexander the Great, mentioned by Herodotus, Aristotle, Xenophon, and Strabo amongst the Greeks, Pliny and Solinus among the Latins. Clay models of the noble dogs with which Assurbanipal, son of Esarhaddon, hunted the lion are to be seen in our national collection. The people of Colophon and Castabala, Pliny writes, kept troops of dogs for war purposes, which fought in the first ranks and never retreated. Arrian, who, like Xenophon, was a true sportsman, gives in his excellent work on coursing interesting particulars of the care and skill bestowed on rearing and training hounds for the chase and for domestic use.

* *Gleanings from the Natural History of the Ancients.* By the Rev. W. Houghton, M.A., F.L.S., &c. Illustrated. Cassell, Petter, & Galpin. 1880.

The Egyptians are the first people among whom we find notices of the cat. It figures largely upon the monuments as a domestic pet, and was honoured when dead. Comical stories are told by Herodotus of the anxiety to save the cats when a house caught fire, and of the grief when one died. The cat seems to have served as a retriever in fowling expeditions, and even in fishing. It seems strange that no mention of the cat occurs in the Bible or in any Assyrian record. Even in India Professor Max Müller is quoted as saying that it was but recently known as a domestic animal. Its Sanscrit name is mârjâra, from a root meaning to clean, from the creature's habit of licking herself at her toilet. Her mousing habits were well known to the Romans, and even to the Etruscans, as shown by antique gems and even wall paintings. The mouse-killer domesticated among the Greeks, called γαλῆ, described by Aristotle, and humorously referred to by Aristophanes in the *Peace*, has been shown by Professor Rolleston to have been our white-breasted marten (*Martes foïna*), a different animal from the γαλῆ ἀγρία or ἴκτις, which was larger, and a great lover of honey as well as a killer of birds. Mr. Houghton dwells upon the remarkably scanty occurrence in Latin writers of the word *felis* or *feles*, Cicero using it but once, and that when speaking of Egyptian cats. Ovid in a single passage speaks of a mythological *felis*, into which the sister of Phœbus was changed (*Met.* v. 330). Besides the cat the Egyptians domesticated the ichneumon, popularly known as Pharaoh's rat, which is still to be seen in houses at Cairo. The cattle and horses of the ancients, as well as their poultry and farm produce in general, are graphically brought before our eyes by the wall-paintings of Egypt and the tablets and bas-reliefs from Assyria which adorn our museums. Illustrating his pages with some of the most expressive of these, Mr. Houghton is able to make abundantly clear the points of resemblance and contrast between these early and foreign types and those familiar to ourselves. About two-thirds of his book are taken up with the domesticated animals of all kinds, the remaining third being given to the wild animals. Foremost among these is the king of beasts, who has now disappeared from Egypt, Palestine, Syria, and the whole of Europe, but who was well known and worshipped in Egypt, if not, as is thought likely, tamed and trained for the chase. The grand monarchs of Assyria are portrayed hunting the lion, and even encountering him single-handed. The hyæna was hunted in Egypt, and deer of many kinds excited the ardour of lovers of the chase, whose sport in its manifold forms is vividly described by Xenophon. The disputed identity of the unicorn—in the Hebrew *reëm*—is discussed by our author, who shows it, from Deut. xxxiii. 17, to have certainly had more horns than one, and makes it, with the greatest likelihood, the same as the wild bull of the Assyrian monuments, the Akkadian *am-si*, or ox with horns. Another controversy, never perhaps to be finally disposed of, why the beetle was worshipped by the Egyptians, is the last treated of in this excellent little work, and is still left in much uncertainty. Was it a symbol of the world, or of the sun or the moon, or of Pthah, the creative power of spring, or of fecundity, or what not? Our author is inclined to believe that the main idea involved was the insect's habit of forming balls of dung as depositories for its eggs, which came to be looked upon as a symbol of the sun's creative power. Others have seen in the action of its fore-feet the suggestion of the posture of worship. One of the best qualities of Mr. Houghton's treatment of whatever he takes in hand is that he is instructive and critical without being dogmatic.

ANGLERS' EVENINGS.*

IN Manchester, by the festering banks of the Irwell, in the very centre of river pollution and of all uncleanness, there exists a little missionary band which preaches the virtues of pure water. This band is called the Manchester Anglers' Club; and, as they cannot fish in the black and poisonous streams of their district, they meet in the evenings, and read papers descriptive of distant sport and scenery. These papers have been published, under the name of *Anglers' Evenings*, and form a very pleasant little book, which we heartily recommend to all who love to be quiet and go angling. The members of the Club have wetted their lines in some far-off and in many familiar waters; but, before following them to Scotland and to Norway, let us quote what Mr. Corbett has to say about the condition of the Irwell. The cynical stupidity of defiling rivers by making them common sinks (a practice which is destroying the salmon in the Tweed, the Eden, and the Inne) has never been more plainly demonstrated:—

> And now for the future of the Irwell. There have been put into it, as refuse, several materials which, with the progress of science and invention, have been found capable of better uses, and of these I will name a few. Gas-tar was put in; it now sells for thousands of pounds per annum, and forms the basis of many important trades. Ammonia-water was so wasted, and it is now sold and used. Gas lime was also freely put in the river before a better use was found for it. Cotton waste was put in, I have seen the river white with this material; we have now a group of traders called cotton waste dealers, who have an Exchange of their own. Dye stuffs have been redeemed from waste to a large extent, but they yet form a great portion of the river's pollution. Soap has been very largely put in, and in some cases profitably kept out and converted into fine tallow candles and alkalies. Metallic and chemical refuse, coal, ashes, and cinders are yet thrown into the river. And last, though not least, the valuable article called sewage is still put into the river, to an extent causing a loss, in my belief, of more than a million pounds a year to South Lancashire. At Wrexham, and many other places, it yields a clear profit to the sewage farm of more than 10*l.* per acre per year. The increase in the revenue of land so improved in South Lancashire, to the extent of twenty miles by twelve, would exceed a million a-year, and the sewage of the town would improve such an area very materially, without nuisance from over irrigation. Science has so far advanced as to show that it is profitable to keep sewage out of the rivers, and legislation must proceed to prevent the abuse of the water-ways of the country.

It is more pleasant to turn to Mr. Heywood's account of trout-fishing in Norway. When he has a fortnight's holiday Mr. Heywood crosses from Hull to Bergen, and instantly has his reward. At Dale he finds "the most beautiful spot in the world," and plenty of sea-trout fishing. By an admirable "dispensation" the sea-trout generally does live in the midst of lovely scenery. Mr. Heywood found that of Dale so glorious that he wisely declines to describe it. He was even tempted to throw down his rod for a time, and vow that it was a shame to let anything interfere with the enjoyment of landscape so pure and noble. But his better nature revived, and he was soon busy landing another "Stor fisk." This was wise, for there are plenty of beautiful places where one may go and stare at mountains and cataracts and yet can get no fishing. In many high districts of Switzerland, for example, the success of the cunning old village angler is a mystery unsolved by tourists. The only drawbacks to perfect bliss in Norway are the rather poor accommodation, the scantiness of food, and the existence of some English sportsmen who monopolize great stretches of river. Mr. Heywood was lucky enough to make friends with a fish-spearing but hospitable old farmer in a red cap, who gave him luncheon and leave to angle in his waters. If the inns are not sumptuous, they are not dear, and tenpence-halfpenny usually settled the bill. In one day's walk Mr. Heywood thrice filled his basket with trout, which seem to have varied in size from half-a-pound to three pounds. Minds peaceful and contented take this to be better sport than most salmon-fishing, and it is pleasant to wield a rod rather lighter than a weaver's beam. The bathing was found worthy of the hexameters of Clough—"The water is charged almost like soda-water, with bubbles of air." Norway is clearly the place for the energetic angler, now that commercial enterprise has ruined the rivers at our doors.

How few anglers have tried sea fly-fishing with stout, but not coarse, tackle! E. G. S. contributes a paper on this sport, as pursued by him off the Isle of Man. When a man is forced, for want of better sport, to fish in the sea, he commonly uses the very rudest rods and tackle—the poles, for example, with lines of string and big white-feather flies, common on the Argyleshire coast. With these weapons you may have some butcher-like and facile successes, or you may "grup" nothing at all. E. G. S. tried strong salmon tackle, a civilized rod, flies of some neatness of make, and he trolled with sand-launces by way of bait. He was rewarded by the capture of mighty mackerel, and of "corlig" or "lythe," as the Scotch call them, of seven or eight pounds weight. We can testify that lythe run like sea-trout, even when hooked with tackle that seems strong enough to land the kraken. E. G. S. says with perfect truth that "there is no greater mistake than to use coarse tackle for sea-fishing, whether with the rod or line. Doubtless a very large quantity of fish may be taken with any sort of tackle when they are on the feed; but the experience of those who have tried fishing with fine and carefully made tackle is, that even when fish are not greedily feeding, twice the number may be taken." It is an opinion which we have long held in secret; but the custom of most places is so strong in favour of brutally robust tackle, that to use anything lighter seems affected, unEnglish, and almost savouring of violent Radicalism. The paper of E. G. S. contains minute directions to guide the convert into a form of fishing which, prejudice aside, promises really excellent sport. Two big mackerel, hooked at the same moment on light tackle, can only be landed by skill and patience; and who can say that a "pollack" which runs out fifty yards of line at his first rush is a fish to be despised? E.G.S. adds to his essay the advice not to loose the light skiff with a companion who is a "non-fisherman." Such a being always gets bored and gives trouble, and a non-fisherwoman is a still greater plague. Mr. Edwin Waugh adds a short and humorous story about conger-fishing, told in the Lancashire dialect. Mr. Reid's paper on Grayling is straightforward and useful; for his practical advice we must refer anglers to his essay. A short sketch of cockney fishermen is contributed by Crabstick. This writer has found out an inn on the Tweed which we had fondly believed to be the secret home only of a small band of anglers who keep its whereabouts dark. We do not mean further to divulge the secret thoughtlessly revealed by Crabstick. At this excellent hostelry he met two Southrons in patent leather boots, who tried to fish in the Tweed with "floaters, floaters painted green and white," with the success that may be imagined.

A Manchester party in the kingdom of Galloway has had triumphs which simply amaze us. They followed the course of the Ken, from the two narrows which bear the name of the "College Loup" and the "Tinkler's Loup" (because a tinker and a student leaped across them at some unknown date) down to the "Lochinvar Arms" at Dalry. They declare that they filled their baskets with trout. Now we have fished the Ken with every possible and impossible lure (except worm), from trout-flies to the last thing in imitation minnows, and have never seen anything in

---

* *Anglers' Evenings: Papers by Members of the Manchester Anglers' Association.* Manchester: Heywood & Son. London: Simpkin, Marshall, & Co. 1880.

the water but parr and salmon. There are "splendid trouting streams," as our authorities say, but (at least in autumn) there seem to be no trout in them. Perhaps pike from Loch Ken demolish the trout, or other theories may occur to the scientific imagination. To be sure the invaders went north in spring:—

After the smoke and dust and din of busy Manchester, how serene and balmy the atmosphere of the Stewartry! How inspiriting and elastic the clear sunshine! How lovely the budding hedge-rows, and the mossy banks and woods dotted with pale primroses and sweet violets! The songsters of the woods had once more awakened to new life, and were pouring forth their thrilling strains of melody. The young lambs frisked and gambolled in an ecstasy of delight, the cattle browsed in the fields. The cuckoo gave forth its doleful but melodious note, and the mavis from the shaw saluted his brooding mate. The trees, which were recently so naked and skeleton-like, were fast assuming their beautiful appearance; with branches, lately so bleak and naked, now gracefully bending under the weight of bursting buds and blossoms.

It may be possible that a stream which is good in May is useless in August, only let no man, deceived by the prose and poetry of the Manchester anglers, expect to catch trout in the Ken in autumn. In August we may say of the Galloway waters, as Mr. Stoddart long ago sang of Yarrow,

Waes me! the ancient yellow fin,
I marvel whar' he's gaen tae;
Was ever trout in Forest rin,
Sae comely or sae dainty!

In or near the Forest—namely, at St. Boswells, on the Tweed —Mr. Vannan found good sport. The Tweed is sadly changed since Mr. Stoddart hymned it in verses whose music somehow keeps a kind of echo of the unresting river. All the "mills" of Galashiels have poured their filth into the beautiful pools and streams, and we agree with Mr. Vannan in holding that this pollution is the probable cause of the salmon disease. Here, however, is the record of the sport of William Rankin, a *blind* angler of St. Boswells:—

From twenty to thirty pounds is quite a common weight of fish for him to carry home as the product of one day's fishing; and that in a part of the river, say within a mile or two of St. Boswells, where it is necessarily very much fished. But then the water must be in perfect ply for the minnow, and other circumstances must be favourable. His most successful time is when the flood is falling, and the river assumes that deep-black, and yet clear colour, which all anglers love so well. He informed me that, during the spring of the present year (1879), on two successive days in April, he killed with *artificial* minnow, nine sea-trout, and two or three river-trout, the total weight being thirty-six pounds. On one occasion, with flies of his own tying, he took out of one stream in the Tweed ten trout, weighing seven and a quarter pounds; on another, below Mertoun Bridge, he hooked with fly eight sea-trout, five of which he landed. He now prefers minnow-fishing, because he can make heavier baskets. During two days' salmon-fishing, at the close of November, 1877, he killed on the first day three salmon, weighing twenty-two, thirteen, and ten pounds respectively; and on the second, two salmon and four sea-trout—the salmon twenty-two and seven pounds each; the largest sea-trout seven pounds, and the smallest three.

The dexterity of Rankin, who in spite of his blindness can wade a river so deep and treacherous as the Tweed, is really amazing. At St. Boswells another local angler, William Younger, is the son of a very remarkable man, a rural poet and fly-fisher, and the author of a capital little book on Tweed-fishing. The Tweed fishers are generally interesting companions; they live all their lives with nature, content with very slight gains, and a free, and one may almost say a romantic, existence.

We have hardly space for a full notice of Mr. Bantock's capital paper on Sutherlandshire. No better ground can be recommended to the trout-fisher, who from Inchnadamph can angle in that beautiful sheet of water, Loch Assynt, in Loch Awe, rich in well-fed trout, or in lonely Mulach Corrie, where the rare gillaroo is found. "Gott pless her grace, the goot Tuke of" Sutherland, is the prayer of every angler who visits the Northern county, where capital roads and comfortable inns do not spoil one's delight in the most remarkable of Scotch mountain scenery.

With a word of praise for Mr. Estcourt's "Bibliography of Angling," we close this review of a charming book with an extract to prove that "the mute little fish" are admirers of female beauty. The extract is from an otherwise rather unsatisfactory paper by Mr. Faraday, on "The Mind of Fishes":—

It was the blennies who manifested that appreciation of feminine beauty to which I have alluded. They were generally indifferent to the presence of spectators. On the occasion in question I had the honour of conducting a number of young ladies, pupils from one of our principal schools, round the exhibition. It is necessary to say that the young ladies were merging into womanhood and were exceedingly good-looking. No sooner had we arrived before the blenny tank than one of the fish, happening to turn his head, caught sight of the unusual spectacle and instantly rushed to the front. Other blennies, attracted by his sudden movement, turned round, and followed, and speedily every blenny in the tank (there were some hundreds in all), was pressing his nose against the glass, and a row of gleaming eyes was seen, expressing such intense and unmistakeable admiration and amazement that some of my fair companions actually blushed.

We wish the Manchester Anglers' Association good sport, and plenty of interesting papers to be read in "the winter of our discontent."

THE JUSTICES' NOTE-BOOK.*

MR. WIGRAM has succeeded in what might seem the hopeless task of writing a law book which is at the same time a valuable and trustworthy manual of the branch of law to which it refers, and is also really amusing and eminently readable. The author of this new "Mirror for Justices" is as full of "wise saws and modern instances" as the typical Justice described by Shakspeare, and his appearance on the bench must be hailed with delight by his brother magistrates, no less on account of his obvious acquaintance with his work than on account of the genial spirit which, if we may judge from the tone of his book, his presence must shed over proceedings which are sometimes of necessity dull and disagreeable. In treating of some departments of law, which require elaborate exposition and laboured argument, the light-heartedness of Mr. Wigram's style might be out of place; but the transaction of justices' business is for the most part, at least in theory, pretty plain sailing, and Mr. Wigram has taken the best possible means towards the desirable end of inducing gentlemen on the Commission of the Peace to acquaint themselves with the nature and method of their judicial duties, by rendering his book such as they may read through without weariness. Too many country gentlemen take their seats on the bench in the condition described by Mr. Wigram in his preface, never having heard a case tried, and with the instincts and education of an English gentleman as their sole credentials and qualifications. Such men are to an undignified extent dependent on the magistrates' clerk, and their legal experiments occasionally result in those glaring blunders of law or judgment which have—perhaps, on the whole, unfairly—made "justices' justice" a by-word. Apart from the actual wrong inflicted by erroneous or unduly severe punishments, the spread of education nowadays renders a blunder palpably apparent to classes which in former days were more apt to accept the authority of their social superiors as infallible; and it therefore behoves every man who has a position to sustain to be very careful that he does not lessen the influence pertaining to that position by exposing his incapacity to occupy it.

Mr. Wigram's book takes the form of a modest volume in two parts, the first comprising a brief account of the formation and practice of the tribunals in which justices exercise their functions; the second, a condensed digest of such portions of the criminal and civil law as fall within the province of the justice of the peace. Indeed it may be said that this digest contains, of course in very compressed form and with the omission of all technicalities, a complete synopsis of the criminal law, inasmuch as justices may have to deal with offences of any nature or degree in the course of preliminary investigations held for the purpose of deciding whether persons accused of those serious offences which lie beyond the jurisdiction of justices to decide summarily shall be committed for trial or discharged. The presiding at these investigations constitutes by no means the least important branch of a justice's duty, and Mr. Wigram shows a very just appreciation of the gravity of the issues sometimes involved. At p. 28 he says:—

The committal of a person for trial may in some cases be matter of the most ordinary routine, while in others it is a step involving very grave responsibility. Even upon the assumption that justice is certain to be done in the end, it is no light matter, when unconvinced by the prosecutor's evidence, to inflict upon a man the injury to character, anxiety of mind, and loss of time and money, which are the inevitable consequences of sending him before a jury. It is true that inconveniences of this kind must be resolutely inflicted when public interests are at stake. It is also true that very unpleasant surgical operations are at times indispensable. But if any such operation might have been avoided by a little more judgment or experience on the part of the ordinary medical adviser, he will hardly, if he be wise, attempt to pacify his patient by any truism of the kind.

The other branch of justices' work—namely, that of dealing summarily with minor offences and adjudicating on certain classes of civil claims—though less important in individual cases, yet covers an immense area and involves the application of numerous statutes, some of which are masterpieces of complicated and obscure legislation. Add to this what Mr. Wigram calls administrative duties—"the control of the liquor traffic in all its branches, the granting of licenses for various purposes, the general and authoritative superintendence exercised with respect to highways, lunatics, and the poor, the attendance at Prison and Asylum Committees, &c."—and it will be seen that a conscientious justice's office is no sinecure. In fact, it is marvellous how large a portion of the national welfare is entrusted to the care of the Great Unpaid, assisted only by a comparatively few stipendiary magistrates and recorders, and how well, on the whole, the system works.

With the minutiæ of Mr. Wigram's First Part we do not propose to deal at length. Brief rules are given for the conduct of the hearing of non-indictable offences and complaints, and as to the preliminary investigations of indictable offences, with observations and criticisms on the alterations introduced into the pre-existing procedure by the Summary Jurisdiction Act of 1879, accompanied by a short analysis of the provisions of that statute; whilst a chapter is devoted to the consideration of quarter sessions and appeal, the latter subject being, however, more fully dealt with under its appropriate heading in the Digest.

This Digest, which, as we have said, constitutes Part II. of Mr. Wigram's work, is really most admirable in its way.

* *The Justices' Note-Book.* By W. Knox Wigram, of Lincoln's Inn, Barrister-at-Law, J.P. Middlesex. London: Stevens & Sons. 1880.

The statement of the law is interspersed with shrewd commentaries, little bits of advice replete with common sense and good judgment, and illustrations the humour of which is only equalled by their appositeness. Cases are quoted where they are necessary or useful for exemplification, but not in such number as to be confusing or to divert attention from the principles enunciated. The only fault we have to find is that those offences which are not triable at sessions or summarily are not in every case sufficiently distinguished from those which are. Reference to other portions of the book would no doubt solve any question which might arise; but the information might be so easily conveyed in an abbreviated form that there should be no room left for possible hesitation, even at the risk of repetition. As an instance of this sort of omission, we may mention the offence of night-poaching by three or more persons armed, referred to at p. 191 of the Digest, where no indication is given of the fact that this particular offence is not triable at sessions; while, curiously enough, the same offence is also omitted in the list given at p. 45 of crimes only punishable at assizes or in courts of equivalent jurisdiction. Some few inaccuracies have crept in; but they are mostly such as are traceable to the plan necessarily adopted of laying down rules very briefly and comprehensively, without taking into account the exceptions which judicial refinements may have superimposed on those rules. But Mr. Wigram has been a little hasty in post-dating his book in the year 1880, inasmuch as the heading "libel" was obviously written before the late decision in the Labouchere case. After correctly stating that "Justices have no authority to examine into the truth of a charge of libel preferred before them as a possible ground for declining to commit the defendant for trial," he proceeds:—"But any witnesses tendered by the accused on this or any other point ought to be heard, and their depositions taken in the usual way"—a proposition distinctly negatived in the above-mentioned case. We would specially single out for notice, among the short articles in which Mr. Wigram summarizes the law upon different points, those which treat of the "Intoxicating Liquor Laws." The enactments constituting the system by which the sale of stimulants in this country is regulated are, as is well known, numerous and involved, being in many cases interdependent to a most perplexing degree. Mr. Wigram has, however, evolved order out of this legislative chaos, and, by dint of careful arrangement and explanation, has managed to present a comprehensive view of the present condition of the law on this point as administered by justices. Game, too, as a subject of paramount interest to country magistrates, comes in for due notice, and Mr. Wigram gives an elaborate exposition of the somewhat anomalous attitude of the Common Law towards the feathered and furred attributes of the soil, and of the efforts of the Statute law to encircle them with a protection equivalent to that extended to things falling within the meaner category of chattels. In protesting, as a justice should do, against the supposition that Game-laws are passed in the interest only of the rich and as an instrument of oppression against the poor, Mr. Wigram waxes quite warm, and we transcribe a portion of his justification as affording a good specimen of his lively but pithy style of writing:—

> It is supposed by a good many people that the Game-laws are framed in the interest of a privileged class. Into that controversy we are not now going to enter. It is only fair to remember, however, that the wealthiest landowner in England may not carry a gun across his own stubbles, much less knock over one of his own birds, without a ticket-of leave from the Excise first purchased and paid for. Even when the partridge lies dead at his feet it is his own only in a qualified and incomplete sense. It is game as much as ever. No charge of shot can drive that out of it, or reduce it to the level of unsanctified duck or chicken. He may dine upon it or give it away, but he has no right to sell it—except, indeed, to a licensed dealer with an Excise board over his door. He can't even sell it to him unless he hold a shooting certificate running over the entire year. We may warn the poacher out of our woods, but we certainly submit to restrictions which the poacher wouldn't if he stood in our shoes.

How enlightened are Mr. Wigram's views on the matters coming under his notice, may be judged from his expressions of anxiety for the speedy introduction of the Criminal Code; his wise cautions with respect to cases of alleged cruelty to animals by servants, in which humanity for the animal is combined with consideration for the servant, who may in many cases be infinitely less to blame than his employer; his obvious repugnance to punishments being inflicted on children which may tend to injure their prospects in life; and his intolerance of the senseless clamourers against vaccination.

We have hitherto forborne to quote any of the stories with which Mr. Wigram seeks to beguile his brother justices along the path of duty. The apparent paradox which he puts forward, under the head of Bigamy, of a couple who were married at their own parish church with every customary ceremony and observance, being both of full age, sound in body and mind, British-born subjects, and without the slightest obstacle in the way of kindred or affinity, and who yet are not legally man and wife, and might either of them marry again without any risk of being prosecuted for bigamy, is a curious legal problem only to be solved by the explanation Mr. Wigram gives later on in his book. Under the head of Malicious Mischief, the author gives a curious instance of what in his opinion constituted an offence of this nature, the case being that of a compositor who by way of joke altered one single letter of a word which he had set up, after the proof had been revised by the author. The word occurred in the middle of a solemn poem, the transformation rendered it "horribly grotesque," and the thing was not discovered until the whole edition of an expensive work had been printed and circulated. There are many incidents of a like character recorded in Mr. Wigram's book, but we trust that what we have already said will suffice to demonstrate that, both in its grave and its livelier portions, it is thoroughly good, and to recommend it to the attention of those for whom it is primarily intended. Further than this, it is a book which any one might read with profit, and with a strong probability of finding something therein to his advantage. We confess that we first learnt from Mr. Wigram's book the gratifying news that, at least within the Metropolitan Police District, a man may have the satisfaction of apprehending with his own hands an organ-grinder who insists on playing near his house after having been told to go. It would be still more satisfactory, however, if he could always be sure of finding a policeman at hand to do it for him.

A YEAR IN PESHAWUR.*

THIS work recalls to us the cynical remark of Gibbon about the discoverers of sacred relics, who invented names for skeletons, and actions for names. The author of this slender story has experienced what it is to live in a cantonment on the "unscientific" frontier of India, where officers may be shot at in the twilight if they venture beyond the "Circular Road" and the "Mall," and where clever thieves can carry off horses from under the very noses of the somnolent *syces*. Mrs. Trevelyan describes garrison life with a good deal of truth and without affectation, but she seems to us deficient in the ability to weave a consistent and animated story out of her experiences; and her characters, she is careful to tell us, are "typical," and not drawn from life. Practically, if not exactly like Sir Anthony Absolute's dummies, "fit only to dust the company's regimentals," her captains and subalterns are mere pegs to which the incidents are made to fit. The men and women are pen-and-ink sketches, and the whole story hangs together rather loosely. We could almost wish that the dashing lieutenants, the attractive married ladies, and their charming daughters just fresh from England, had been taken from living models. Anglo-Indian authors, in several recent instances, have proved that it is quite possible to draw from nature without encountering the averted looks of their friends and the indignation of the mess-room. Bereft of all individuality, even frontier officers in these stirring times are apt to become tame and lifeless in composition. Then Mrs. Trevelyan is rather unskilful in the development of her incidents. They lack coherence and sequence, and we are more than once tantalized by headings of chapters which lead nowhere in particular and do not advance the story at all. The Indian anecdotes and sayings, like Captain Clutterbuck's stories about Egypt, are somewhat threadbare; and the sentences in Urdu are such as, for orthography and idiom, would hardly satisfy the most lenient Board of Examiners. However, the ground chosen is comparatively unbroken; some of the events are not impossible, if slightly sensational; the style is fair; and the book is quite readable and not too long.

We must presume the 39th Regiment of page 13 to be intended for the 139th, or else for Thackeray's onety-onth. The famous English corps known as the 39th in reality fought at Plassey; and, nearly one hundred years later, was conspicuous at Maharajpore; and it bears, as Macaulay has told us, the proud motto "Primus in Indis" amongst its titles to distinction. Of this excellent regiment a certain Colonel Lindsay is in command, and amongst the officers are Captain or Lieutenant Gordon—for we are not told which—and Robert Hale. The former is a great athlete and a capital sportsman, but unluckily not a ladies' man. Somehow we are quite prepared to hear that these officers, so fearless everywhere but in female society, who are supposed to be confirmed bachelors, fall hopelessly in love almost at first sight when the right young lady with a "distinguée air" and an "unconscious hauteur" makes her appearance at the beginning of the cold season. Robert Hale is junior to Gordon, and has fair curly hair, is a light weight and a capital hand at Polo. Major and Mrs. Munro are exemplary characters. The Major exerts himself to relieve his men of what Mr. Matthew Arnold would term "the hideousness" of barrack life in the hot season. Mrs. Munro nurses young Hale through a fever, which we regret to note he had caught by persistently shooting during the middle of the day like an arrant *griff*, in a tiny cap. We should have thought no frontier officer need have been warned that a helmet of pith or other suitable material was the first condition of Indian sport. But then several of Mrs. Trevelyan's characters do very "griffinish" things, as we shall show. The adjutant, Captain Chaplin, has a charming young wife. The other characters are made up of Mrs. Jones, a flighty woman, willing to flirt whenever she can find an accomplice; the O'Dowds, with a large family and small means,; Mr. Brown, a young officer of Sepoys; the Townleys, a worthy pair, the husband having a turn for horseflesh and for selling Cabuli horses at double their cost price, while Mrs. Townley has the proper pride of the cavalry branch of the service, and can look down severely on the wives of officers of native infantry. A certain Colonel Carter is rather to be pitied. He is posted at Shub-

* *A Year in Peshawur, and a Lady's Ride into the Khyber Pass.* By L. R. Trevelyan. London: Chapman & Hall. 1880.

kuddur, one of the forts on the frontier, and lives in the tiniest of country quarters, and in the neighbourhood of wild tribes ever ready to shoot or stab an Englishman. But his daughter Flora, a sunny and bright companion, shares his solitude, and makes a palace of ease out of the couple of rooms allotted to her and her father.

The earlier chapters of the book introduce us to all these characters, and to the conversations and petty incidents which make up seven-tenths of the Anglo-Indian's life. There are the usual morning calls. There is a "paper chase," in which Mrs. Chaplin is very nearly meeting with an awkward accident, but is rescued by young Hale, without any ulterior scandal. There is a journey to the hills, brought in apparently for the purpose of showing that native ponies jib and kick, and that native coachmen make foolish excuses which deceive no one. We must, however, point out that for more prosaic and ordinary events of this kind Peshawur has no claim to superiority over the dullest station in Oudh or Eastern Bengal. So the real interest only begins when Gordon and Hale, and two officers of native infantry, Fuller and Peters, obtain a week's leave to shoot in the neighbourhood of the fort at Abazaie, an outpost corresponding to Shubkuddur and Michnee, which, readers will note, are real and not imaginary places. Now it is well known that sporting excursions on disturbed frontiers are occasionally full of danger; but it was hardly necessary to make dashing officers of the type described commence operations with a naïve simplicity worthy of a midshipman who has landed for a day or so from the Commodore's ship when it happens to lie for a time in one of the reaches of the Hooghly. The four sportsmen take neither ponies nor native attendants with them. They have nothing but dry biscuits to eat. They walk twelve miles straight on end without seeing a thing or firing a shot. At length they discern a small hill with a village at its foot some three miles off for which they make a push. On nearing the place they are met by a string of natives headed by a fine-looking man with a long black beard, who puts to them several very pertinent questions in a very independent fashion; remarking, in answer to their plea that they were true men and not spies, that they had no *shikaree* with them and had shot no game. The upshot of the parley, carried on by both sides in indifferent Hindustani, is that the four Englishmen are marched off as prisoners, stripped of their coats, and confined for the night. For food they are given milk and *chupatties*, which, as is truly remarked, forms an unpleasant contrast to the Christmas fare which their friends were enjoying at Peshawur. Three of the four are then taken on to another village, Hale remaining behind as a sort of hostage, though with what specific object is not very clear. How the captives are shut up in a sort of public building, and how they are regaled with greasy dishes, while the Headman of the village devises a plan, not to murder the Englishmen, but to carry off the daughter of a rival chief who had been refused to him by her father, is very fairly told. A row ensues, during which the captives escape, just in time to find the bride set down by the dismayed bearers in her *dhooli*, and the Englishmen escort the girl in safety to the village of her would-be husband. This incident, of course, completely turns the tables. Mahomed Ali, the bridegroom, is eternally grateful, loads the deliverers with presents, giving Gordon in particular, a curious silver ornament which figures subsequently in the story, and sends them back with all honour to British territory.

After this we are treated to one or two more stirring incidents. Flora Carter ventures on the Indus on a raft supported by *mussuks*, which the author interprets as "pig-skins." We must assume them to be goat-skins, seeing that the boatman is a Mahomedan. On this frail structure they shoot certain rapids, and as the young lady neither faints nor screams in the midst of dangerous rocks and foaming waters, it is quite natural that one of the officers should henceforth talk of nothing but Miss Carter, and should have an insatiable longing to pay another visit to Shubkuddur Fort. After this young Hale's pony bolts with him at Polo and shies his rider against a stone parapet; though, as we have said, this sort of incident rather impedes than facilitates the progress of the story, and things get flat and commonplace until the chapter about the dog-fight. It seems that one Major McMullin, who is at Michnee what Colonel Carter is at Shubkuddur, having no sunny or bright daughter, consoles himself with the affection of a dog, which can be backed, or, more correctly, can back itself, to beat off any pariah or native dog. After a set-to, in which the dog belonging to one Dalli Khan is worsted, the defeated owner revenges himself by attacking the unlucky Englishman with the aid of three other ruffians, and cutting off his head. We confess that the preceding chapters of social gossip and station amusements had by no means prepared us for this startling tragedy. To make matters worse, Gordon and Peters, who were present, very properly shoot two of the attacking party, and then have to make a clean bolt, though, if their guns were breechloaders, they might have reloaded and have given an account of the two others. Peters gets safe to the Fort and rides on to Peshawur. Gordon, who seems to have very "unscientific" notions of the geography of the place, makes for the hills instead of for British territory, and reaches a village the inhabitants of which deny him shelter. This treatment saved his life, because when Dalli Khan arrived in pursuit of his victim, Gordon had been taken in by some rival villagers who sent him off under a guard to the Khyber Pass. For a time this errant officer disappears from the story. Meanwhile it is not made clear to us why the authorities do nothing to revenge the dead or to rescue the living. Indeed the whole story in which some officers are allowed to go on shooting expeditions to the very foot of the hills while others never think of organizing an expedition to rescue their comrades, savours of a laxity which makes demands on our indulgence. Real officers have, it is perfectly true, been carried off ere now by marauders; but nothing else is thought of in every cantonment on the frontier until they are brought back uninjured. But Mrs. Trevelyan chooses to bring about her *dénouments* by a more pacific agency. Just at this crisis the Commander-in-Chief comes to inspect the troops at Peshawur, and insists on having a little morning's ride through the famed Khyber Pass on his own account. If we recollect rightly, there is some foundation in fact for this adventure, and some part of the Pass was actually explored before the late warlike expedition. Miss Lindsay, being of a fearless nature and having some qualms in regard to the missing Gordon, persuades her father to allow her to accompany the party—an act of indulgence for which some rigid martinets might think he ought to have been deprived of his command. We should state that an escort has been very properly sent by the Ameer of Cabul to protect the English party—an announcement at which we are much less surprised than we are at the statement that the Commander-in-Chief "seemed very pleased to have a lady in the expedition." However, away the riders go, and Miss Lindsay, who had at first led the expedition on a frisky mare named Finella, gradually drops behind with Major Munro, has a fall, and loses the protection of the escort. In this dilemma they think to save time by taking a short cut over a hill, but only get bewildered in steep paths, when, just as they are beginning to repent of their rashness, five men start up, apparently out of the ground, and lay hold of their bridles. The rescue is effected in a mode which resembles the escape of Waverley when he was under charge of Gifted Gilfillan. The audacious raider who was leading off Miss Lindsay receives a stunning blow on the head from the hand of a native soldier who has followed the party unobserved. The reader will scarcely have anticipated that this avenger, who displayed a jot black moustache and a fairer skin than the others, turns out to be Gordon himself. The production by him of the peculiar silver ornament bestowed by Mahomed Ali in the first escapade awes the villagers and ensures a safe conduct for the party. Gordon had been kept a prisoner and made to work like a cooly, till he bribed a native carpenter to aid him to escape in disguise and join the escort provided by the Ameer. We need not dwell on the improbability of this incident. An old Company's officer, versed in native habits, with a good knowledge of Persian and a little Pushtoo, might perhaps escape detection for a time; though we do not know very many men, except Captain Burton and Mr. Gifford Palgrave, whom we could back to pass such an ordeal. But an English officer who is not even credited with a decent knowledge of Hindustani, and who was never the spokesman of his party, would have long before left his bones in the Khyber. However, it was evidently undesirable to introduce a second tragedy into the twelvemonth, and it was necessary to provide Miss Lindsay with a suitable husband; an event which comes to pass with all practicable speed.

Mrs. Trevelyan, we must observe, has narrow ideas about the chances of success in an Indian career, and seems to think that there is nothing in India equal to regimental service with a Queen's corps. Colonel Lindsay had most properly made it a condition of the marriage that Gordon should qualify for the Staff Corps, and every Anglo-Indian knows that this line opens ample field for every diversity of talent. An energetic young officer, once duly qualified, might command the Guide Corps, might become First Assistant to the Resident at Hyderabad, or might fill a Commissionership on a difficult frontier, to say nothing of diplomatic missions and more exalted posts. But we are sorry to say that we detect in the author some slight traces of that supercilious feeling which, more than a quarter of a century ago, enabled a clever satirical draughtsman to give a series of sketches in the *Delhi Punch* on the lofty contempt of the "Royals" in India for the customs of Anglo-Indian society. Mrs. Trevelyan also falls into the not uncommon error of thinking that the massacre of General Elphinstone's force in 1841 occurred in the Khyber Pass. Every reader of Sir John Kaye's History knows that our countrymen were slaughtered in the Khoord Cabul and Jugdulluck defiles. Still we have no objection to Indian books written from an outsider's point of view, provided they are neither too long nor too ambitious. *A Year in Peshawur* fulfils both these conditions.

BEETHOVEN AND HIS CONTEMPORARIES.*

NOT the least curious part of Herr Nohl's industrious collection of matters of and concerning Beethoven is its long dedication to "The Master of Masters, Richard Wagner." Herr Nohl, it appears, had in 1865 dedicated to Herr Wagner the "Letters of Beethoven," and had received from him this not uninteresting reply:—"You must have known what you were doing in dedi-

* *Beethoven Depicted by his Contemporaries.* By Ludwig Nohl. Translated from the German by Emily Hill. London: W. Reeves. 1880.

cating this book to me; you must have known that you would offend that large class who constantly labour to impress the public with the idea that I despise our musical classics. Neither can you be ignorant of the reasons sought in support of this foolish notion; I therefore accept your dedication as a declaration of opinion, and offer you my best thanks." Shortly after this *Tristan* was produced, and Herr Nohl was "impressed by the tragic nature and lofty style of this marvellous dramatic creation," but "knew little of the profundity of its ideas, and the surpassing superiority of its artistic expression." This was much, but more was to come. Two years later Herr Nohl received from a bandmaster at Oldenburg a book of Herr Wagner's called *Three Opera Librettos; with a Letter to his Friends;* and while he was reading this any one entering his room "would have been greatly astonished at seeing a mere book produce such an effect on a man long past the inflammable period of youth." It may be said that "mere books" have been known on many occasions to produce more startling effects than this one did; but no doubt the *Three Opera Librettos* had a somewhat remarkable influence in this case. "Never," says Herr Nohl, "since the nights devoted to Shakspeare and Goethe, and the sunshiny hours spent with Beethoven, had I experienced such a convulsion of feeling; never had I seen such a reflex of my own thoughts or felt endowed with such clearness of vision." Here we have of course the secret of the admiration inspired by a good many "mere books," the reader of which finds or thinks he finds in them "his own sentiments, only infinitely better expressed," or perhaps rather expressed exactly as, if he had chosen to take the trouble, he himself would have expressed them. The sentiments inspired or recalled by the three librettos were peculiarly affecting, for, "as when reading *Faust* I often buried my face in the book in a flood of tears, and paused long before I could proceed, such were its pictures of psychological development and of superabounding life—

In wilden Leiden erwuchs er sich selbst."

We are presently told that what *Tristan* "could not accomplish by ideal beauty, and perfect freedom of poetical and musical expression," the *Meistersinger*, "passing beyond the limited sphere of historical narration, was able to perform by its sovereign mastery over all things, even over the most unpoetical forms and means of art." The writer, becoming less rhetorical, goes on to speak of Schindler's Life of Beethoven and of Herr Wagner's dissatisfaction with it, because, "apart from its miserably piecemeal character, this book does not afford any clear view of the artistic life of the great tone-poet," and to give some account of the plan of the present work. Upon this he is perhaps more to be congratulated than upon the extravagances of his dedication, which however, it must be remembered, sound odder to English than they would to German readers.

Among the earliest information about the great composer's life which Herr Nohl has collected with unflagging patience is an extract from a number of *Cramer's Musical Magazine*, published at Kiel in 1783-4. In this Christian Gottlob Neefe, the Electoral organist, wrote:—"Ludwig van Beethoven, son of the above-mentioned tenor singer, is a very promising boy of eleven." (He was really thirteen.) "He plays the piano with fluency and force, reads well at sight, and has mastered the greater part of Sebastian Bach's 'Wohltemperirte Clavier,' which Herr Neefe put into his hands. . . . This youthful genius deserves assistance that he may be enabled to travel; he will certainly become a second Wolfgang Amadeus Mozart if he continues as he has begun." Not more than three years after this prophecy we find a meeting recorded, which took place at Vienna, between Mozart and the young Beethoven. At Mozart's request Beethoven played something which the other took to be a show piece, and "praised with little warmth." Beethoven then asked for a theme for improvisation; and, "as he always played well when irritated, and was further stirred by the presence of the much-venerated master," he improvised with such striking effect that Mozart "went to the friends in the next room, and exclaimed with ardour, 'Look after him; he will some day make a great name in the world.'" After this there is a certain gap in the narrative; and we may pass at once to Tomaschek's description, in 1799, of Beethoven and Wölfl at Prague. Wölfl was six feet high; his fingers could stretch a thirteenth without an effort; his clothes hung about him like those of a scarecrow; his touch, if weak, was marvellously clear, and, with his unusual stretch, he could surmount difficulties which seemed impossible. When he arrived at Prague he spent all his time before his concert in a billiard-room, where, though he played very well, he lost over six hundred gulden to the master, whom he referred for payment to the receipts of his concert. Here he gave a *concerto* of his own, and followed it by playing "Mozart's Fantasia in F Minor, published by Breitkopf, for four hands, exactly as it was printed, without missing or shortening a note for the sake of execution, as the so-called romanticists of our time delight in doing; who, moreover, produce a fatal confusion of sound by means of the pedal, with which they imagine they cover all defects." After this startling performance he improvised and ended the concert with some brilliant and beautiful variations on a theme which he introduced. His playing, we are told, had neither light nor shade, and was wanting in masculine energy. One could not but admire his skill, but he failed to touch the heart. He was popularly known as "Crazy Wölfl." His performances were compared with Beethoven's in the *Allgemeine Zeitung* of April 22nd, 1799:—"Opinions differ as to their relative superiority, but the majority incline towards Wölfl." This, after what has just been said, seems odd enough. The writer of the article goes on to give as impartial an account as he can of both players. Beethoven's playing, he says, was "more brilliant, but less delicate," and failed sometimes in clearness. "He appears to most advantage in improvisation, and it is indeed marvellous to see how easily and logically he will extemporize on any given theme, not merely by varying the figures, but by a real development of the idea. Since the death of Mozart no one has given me so much pleasure as Beethoven." What follows about Wölfl corresponds pretty closely to what has been already said, but gives him somewhat more credit for feeling. The article ends, just as an article in an American newspaper might end now, with "Wölfl's unassuming and amiable behaviour naturally contrasts favourably with the somewhat haughty manners of Beethoven." Probably the great composer had snubbed the critic. A longer and far more ornate account of the two players was given by Ignaz von Seyfried, who, after pouring forth a cataract of words to describe the emotional effect of Beethoven's playing, says:—"But who can fathom the depths of the sea? Beethoven's improvisation was like the sacred Sanscrit language whose hieroglyphics the initiated alone can decipher. Wölfl, on the other hand, trained in the school of Mozart, was always equal, never dull, and, being invariably clear, was more accessible to the majority. Art served him merely as a means to an end, he never made it a pompous show-piece of dry learning; and he never failed to excite and sustain interest by a well-arranged succession of ideas."

Passing over, amongst other matters, an interesting but brief account of the first unsuccessful and second successful production of *Fidelio*, we come to another reminiscence of Seyfried's. Spohr had been remarking to him upon Beethoven's extraordinary method of conducting, in which he used the strangest gestures, and Seyfried related what happened at Beethoven's last concert at the Theater an der Wein in 1808. He was playing a new pianoforte *concerto* of his own, but at the beginning of the first *tutti* forgot that he was the soloist, and, jumping up, began to conduct in his usual style. At the first *sforzando* he flung out both his arms so violently as to extinguish both the piano lights. The audience naturally laughed, and Beethoven stopped the band and began again. Seyfried now gave the candles into the hands of two choir-boys, one of whom incautiously drew close to look over the pianoforte part. "When the fatal *sforzando* arrived he received such a smart slap in the face from Beethoven's right hand that he dropped his light in terror; the other boy, more cautious than his companion, had been anxiously following Beethoven's every movement, and by suddenly stopping escaped the blow. If the audience had laughed before, they now bust (*sic*) into a truly Bacchanalian roar." This threw Beethoven into a rage, and the first *allegro* of the concerto was quite lost. At another concert of the same period Beethoven's deafness prevented him from hearing the *piano* passages, and, having probably forgotten them, he beat ten or twelve bars in advance of his orchestra. The consequence was that having, according to his method, disappeared under his desk to indicate a *pp*, he rose gradually, and finally leapt into the air for a *forte* which did not come, and then stared round in horrified amazement until he heard it. Fortunately this took place only at a rehearsal. Another account of his conducting at a concert in 1819 is given by the Swedish poet Atterbom, who "perceived by a decided though brief confusion in the time, and by the omission by the performers in their anxiety of a *piano*, that he could hear nothing, for both mistakes escaped him. He stood as if on a distant island, directing his dark, demoniacal harmonies with the strangest movements. For instance, Beethoven indicates a *pp* by gently kneeling down and stretching out his arms to the floor; but for a *ff* he springs up like an elastic bow set free, seems to rise above his usual height, and spreads both arms widely out; and between these two extremes he constantly oscillates.

There are many personal descriptions of Beethoven in the book, from which we may select one given by Friedrich Rochlitz, who wrote of him thus:—

We were introduced to each other. Beethoven seemed pleased, but embarrassed. Had I not been prepared, I too should have been disconcerted by the sight of him; not merely by his negligent and almost savage exterior, nor yet the thick black hair which bristled around his head, but I should have been startled by the *tout ensemble*. Imagine a man about fifty, rather below the middle height, but very sturdy and compact, with an exceedingly powerful frame, something like Fichte's, only stouter and with a fuller, rounder face; restless, sparkling, piercing eyes; a red, healthy colour; hasty in his gestures; in the expression of the face, and especially in the intelligent and vivacious eyes, a union or a rapid alternation of genial good-nature and dislike; in the whole bearing that tension, that restless, anxious listening peculiar to deaf persons with keen perceptions; now talking cheerfully, now relapsing into gloomy silence; and added to all this, the observer's own preconceived ideas. Such is the man who gives pure and intellectual pleasure to millions.

An English lady, who saw Beethoven in 1825, gives what seems a queer account of his poetical taste:—"He preferred English to French authors; for, said he, 'Ils sont plus vrais.' Thomson is his favourite, but he has very great admiration for Shakspeare." A note, however, informs us that he could not read English.

The last chapters of the book are chiefly taken up with accounts, some of them perhaps needlessly painful, of Beethoven's death "in

the midst of a storm of snow, thunder, and lightning." The book is full of interest, which from its nature is of a somewhat scrappy kind; and the translator may be congratulated on the performance of her task.

SWINBURNE'S STUDY OF SHAKSPEARE.*

THERE can be no denying that Mr. Swinburne, especially in his prose works, offers more difficulties to a conscientious reviewer than almost any other writer of our times. His genius is as irregular as it is indisputable, and the judgment of the critic is subjected to more shocks by the eccentricities of this poet than even by the productions of Mr. Ruskin and Mr. Carlyle in their extremest and most painful development. Every eloquent and ardent writer is tempted sooner or later to kick over the traces and say his mind without much regard to the accepted conventionalities of style. But in Mr. Swinburne's case the disease came on very early in life. His first prose essays, published while he was still on his probation, had striking vigour and melody, chastened to a great degree by a taste which seemed generous and delicate even in its exuberance, and which gave promise of much better things. But no sooner had the public accepted Mr. Swinburne as a writer whose utterances were to be received with interest and respect than he gave the reins to his fancy and his rhetoric, and became, as we have said, one of the most embarrassing phenomena that lie in wait for the critic on his thorny path. So deeply marked were the faults and excesses of style in his last important prose work, the *Note on Charlotte Brontë*, that many even of his stanchest admirers deemed it absolutely hopeless to attempt, by calling attention to them, to induce the author to prune and correct his mannerisms. But at last, we are glad to say, the tide seems to have turned of its own accord. Mr. Swinburne's newest prose work, the present *Study of Shakespeare*, is much more sober and dignified in style, and much less overweighted with ornament, than anything we have received from his pen of late years. To give praise to writing that is so good as Mr. Swinburne's when at his best is hardly necessary, but the general improvement in manner encourages us to explain a little more fully where we think there is still great room for improvement.

It is the special danger of Mr. Swinburne to become unreadable, and this is entirely his own fault, for what he has to say is very seldom wanting in interest. Among the tricks that make his prose style fatiguing we place his allusiveness, his love of reference. He is a learned thinker; his mind is stored with memories of parallel events in literature, many of which have never presented themselves hitherto to any mind but his own. He takes for granted that his reader is not only as learned as himself, but in exactly the same condition of sympathy and memory; so he lightly touches on the distant reference that has occurred to him, and neglects to give the puzzled student enough clue to prevent his being obliged to break off his reading and try to summon up the object so dimly hinted at. For instance, in the present volume, in the midst of a disquisition on the *Taming of the Shrew*, the author suddenly reduces his readers to desperation by casually remarking:—

> The recast of it in which a greater than Berni has deigned to play the part of that poet towards a lesser than Bojardo shows tact and delicacy perhaps without a parallel in literature.

Nothing has been said or is going to be said regarding Bojardo or Berni, and to nine-tenths of its readers this passage will remain simply unintelligible and impertinent. The book even opens with a phrase to which the same objection may be made:—

> The greatest poet of our age has drawn a parallel of elaborate eloquence between Shakespeare and the sea.

Now we know perfectly well whom Mr. Swinburne means when he speaks of the "greatest poet of our age," and we are not at all disposed to contradict him; but we regard the trick of style as tiresome and rhetorical, and we think it would have been more convenient to write "Victor Hugo has drawn a parallel."

Another fault which affects Mr. Swinburne's prose style is the oscillating movement of his sentences, their cumbrous construction, and their inordinate length. It would be paying him but a poor compliment to compare him to Dr. Samuel Parr; but we confess that, as we read the laborious sentences before us, we are reminded again and again of the pomposity that awoke the ridicule of Sydney Smith. Of course, when Mr. Swinburne is happy and alert, his sentences are admirable; but when he is constrained by the nature of his theme to traverse ground which does not specially attract him, he reminds us of Satan pursuing that arduous earthward journey outside the gates of Hell. We quote almost at random a single sentence:—

> This minor transformation of style in the inner play, made solely with the evident view of marking the distinction between its duly artificial forms of speech and the duly natural forms of speech passing between the spectators, is but one among innumerable indications which only a purblind perversity of prepossession can overlook of the especial store set by Shakespeare himself on this favourite work, and the exceptional pains taken by him to preserve it for aftertime in such fullness of finished form as might make it worthiest of profound and perpetual study by the light of far other lamps than illuminate the stage.

This remarkable sentence has some of the worst faults that a sentence could have. It is overloaded with words, its parenthetical clauses are entangled in one another, and nothing but the energy of the writer brings us to the close at all. It is declamatory in its essence, and yet so long that human lungs are scarcely fitted to declaim it. After achieving it, the voice pauses exhausted, and is not ready to proceed without resting; while its excessive redundancy—as, for instance, in the needless repetition of "forms of speech"—must be obvious to every one.

When, however, we pass from manner to matter, we have hardly anything to say but praise. After so much weary pedantry, so much homage paid to that obscure deity, the "New Shakspere," it is refreshing to read the sensible and conservative criticism of a poet whose insight teaches him to revere the old traditions and venerable canons of Shakspearian faith. Mr. Swinburne proceeds on the same lines as Dryden and Coleridge before him; he expounds the general scope and aim of the dramatist, without wasting his time on subtleties of scholarship or on the paradoxes of imaginary allusion. About nearly all the plays he has something fresh and bright to tell us, not lingering on any longer than suffices to put before his readers in a glowing light the one point or phase which commends itself to him as hitherto disregarded. For one or two plays, as for *Twelfth Night* and for *Cymbeline*, he has more to occupy his pen; but, as a rule, he confines himself to a rapid survey of three periods which he conceives can be traced in the development of Shakspeare. The first of these is a lyric and fantastic period, the highest point attained in which is in the domain of comedy and romance. The second period, a comic and historic one, represents the great dramatist at the height of his constructive and practical powers, fitted at every point to meet the requirements of the stage. The third period begins with *King Lear*, and displays Shakspeare at the height of his tragical power and in the sweetness of his reflex romantic tendency. Something of all this, of course, has been said before; but the great interest of this newest study is the light which Mr. Swinburne throws on missing links and collateral branches of the main argument. It is perhaps natural that every commentator who approaches Shakspeare should seem to bring out his own essential quality rather than any very fresh feature in the universal genius of the greatest of writers. Pedants pore for a lifetime over the dramas, only to persuade us that Shakspeare possessed, almost intuitively, the learning that they themselves have laboriously gained. To naturalists he seems above all a great zoologist, to lawyers a consummate student of legal practice, and it is therefore not surprising that Mr. Swinburne draws from the study of Shakspeare those brilliant qualities which pervade his own best lyrical writing. It is almost more as a study of Swinburne than as a study of Shakspeare that this book will attract posterity. We see in it perhaps more clearly than anywhere else what it is in literature that the author of *Erechtheus* really values and delights in, and what figures he would depict, what virtues he would celebrate, if his genius were more fully under his own control. Reading the noble passage in which he analyses and eulogizes the greatest personage in the play of *King John*, we begin to realize that Chastelard is not, after all, the model of masculine virtue to the poet who can thus eloquently and fully appreciate the character of the Bastard.

A copious appendix contains a note on the historical play of *King Edward III.*, with which we cannot say that we sympathize very much, and a humorous Report of the Proceedings on the First Anniversary Session of the Newest Shakespeare Society, a parody of the funniest description, which is yet quite within the limits of good taste. We do not know that Mr. Swinburne ever displayed his genuine vein of fantastic humour more happily than in this delightful piece of fooling. After a preamble, in the course of which Mr. A. proves that Chapman wrote *A Midsummer Night's Dream*, which Mr. B. is surprised to hear, since a tabulated statement of the number of times "to" and "from" occur in this play prove beyond question that it is to be assigned to Anthony Munday, the following paper is considered:—

> Mr. C. proceeded to read the argument by which he proposed to establish the fact, hitherto unaccountably overlooked by all preceding commentators, that the character of Romeo was obviously designed as a satire on Lord Burghley. The first, and perhaps the strongest, evidence in favour of this proposition was the extreme difficulty, he might almost say the utter impossibility, of discovering a single point of likeness between the two characters. This would naturally be the first precaution taken by a poor player who designed to attack an all-powerful Minister. But more direct light is thrown upon the subject by a passage in which "that kind of fruit that maids call medlars when they laugh alone" is mentioned in connexion with a wish of Romeo's concerning his mistress. This must evidently be taken to refer to some recent occasion on which the policy of Lord Burghley (possibly in the matter of the Anjou marriage) had been rebuked in private by the Maiden Queen, "his mistress," as meddling, laughable, and fruitless.

Nothing could be devised more ingenious than this as a parody of the mode in which historical allusions are not so much discovered in as thrust upon the text of the poet. The late Mr. Simpson's careful, and in many respects valuable, *School of Shakespeare*, is full of theories as alluring and as baseless as this which pretends to see Burghley typified in Romeo; above all, because there is not one single point of similarity between their characters. We wish, however, that Mr. Swinburne had always confined himself to satire of this innocent and laughable kind. Unfortunately he has once or twice employed language which it were best to leave to the pariahs of literature. We entirely agree with him in re-

* *A Study of Shakespeare.* By Algernon Charles Swinburne. London: Chatto & Windus.

pudiating the so-called discoveries, emendations, and restorations of the latest and most pernicious class of Shakspearian commentators; their mechanical tests please us no more than they do Mr. Swinburne, and we look forward with a cheerful satisfaction to seeing their writings gathered into the garner of oblivion. But our eloquent poet should recollect that for the time being, as a great prophet of his own has said, "we have all of us a right to exist, we and our books," and that private differences about such questions as whether Shakspeare measured his verse by the ear or the fingers hardly deserve such a display of public anger.

BROTHER AND SISTER.*

THIS story opens with a blunder. "A little boat," we read in the first paragraph, "was lying in Fernlie Bay, right across the track which the moon was throwing on the water." It is not the first time that we have come across a novelist who believes that the path of the moon, as it is called, is a certain definite track on the water. We remember a story in which the hero, who had been shipwrecked, was saved from drowning by taking care to keep along it as he swam. He was thus seen by a passing boat, and picked up. Miss Scott would certainly have done well to leave the moon alone; but she is one of those writers who use sun, moon, stars, and nature in general to swell out their story to its proper dimensions. Perhaps, however, we are doing her a great injustice. She may be so young and so inexperienced an author as not to be in the least aware of the base use to which the universe is put by so many of her fellow-novelists. Doubtless she has been a diligent reader of modern novels, and has come to the very natural conclusion that the entrance and the exit of a hero and a heroine are always made to the sound of what may be described as picturesque nonsense. We would beg leave to assure her that even people of middle age can well remember the time when a novelist was expected to keep about him such senses as he had, and when he was not granted the privilege of making himself ridiculous merely because he attempted to tell a tale. All that, however, is changed by this time, and no silliness can be too great but that it will pass muster in a story. The heroine of this novel, for instance, Miss Muriel Ravenscroft, goes to church. So far there is nothing very wonderful. Heroines have gone to church for many an age, and doubtless will go to church for many an age yet. But a wonderful thing happened to Muriel. As the hymn was sung, "the waves of sweet sound seemed to encompass her like a background of pure gold, while a warm ray of sunshine, floating through a painted window, illumined the pale clear profile as with a saint's halo." For nonsense this is very pretty, no doubt; but then it is nonsense pure and undefiled. It is bad enough to have waves of sound compared to pure gold, and to have a ray floating. We will allow these to pass muster, however, if our author can explain how any object in nature, or out of it, so far as that goes, can encompass a person like a background. The preacher, who was Muriel's brother Walter, was almost worthy of her. He described so well in his sermon the dancing in Herod's palace that "the whole picture flashed out visibly before his hearers." A visible flash does not strike us as being anything very remarkable in nature. Next time we chance to be in the midst of a thunderstorm we will carefully notice whether the lightning flashes out visibly or merely flashes. The brother and the sister have a talk after the service. She says she can hear the waterfall tangibly. We have reached but the sixty-fourth page of the first volume, and yet we have already come across an encompassing background, a picture that flashed visibly before hearers, and hearing tangibly. We have passed over, too, Walter's almost weird aspect, who "might fitly have been compared to a sable cloud, to which Muriel was the silver lining." In the next line she seemed, we are told, in her light, soft garments, surrounded by a calm radiance. It is well that it was not in church, at the time when she was encompassed by the background of gold, that she was a silver lining to a sable cloud, and surrounded at the same time by a calm radiance. If our readers have not by this time a picture flashing visibly before them of this charming heroine, we would add that her fair face was illuminated by large almond-shaped eyes of an undefined colour. Her bringing up had been admirable. She had mixed on an equality with the few good families in the neighbourhood. She had made friends with all the poor people; "but there was hardly any middle class, there were no *nouveaux riches* in their society, and vulgarity was almost unknown to her." If vulgarity was almost unknown to her, she must have kept very clear of novels and novelists. There is a vulgarity of the middle class, no doubt, as of all other classes, and there is also the vulgarity of thinking that where there are only county families and poor people there vulgarity is not known. But we have wandered somewhat widely from the natural phenomena which first caught our attention. Before we give a description of the plot, we must not forget to notice some tall spiritual-looking fir-trees, a clarid sky, the great pink orb of the moon in a violet-tinted sky, and the last point of the setting sun that flashed like a diamond over the crest of some dark mountains. The fir-trees screened a church from a road, and perhaps on that account they looked spiritual. The clarid sky we give up altogether. It looks a little like clear sky done into the English of some very poor imitation of Mr. Swinburne, but very likely it was never meant to have any meaning at all. The point of the sun that flashed like a diamond might perhaps be seen in a clarid sky, and so might the pink orb of the moon; only that, we are told, is seen in a violet-tinted sky.

The plot of the story is not very easily described, owing to the abundance of heroes. In the first place, Walter Ravenscroft must justly be reckoned one, as he is the brother who gives his name to the story. Besides, he is the victim of a wicked step-grandmamma and an unjust uncle. He is for years kept out of his ancestral property by a trick. Deprived of his estate, he is jilted by the young lady to whom he was engaged. He suffers from what the author calls a mental blight. He takes opium and he raves. He sees a vision, and it vanishes into a clarid sky. He is only calmed by a skilful doctor, who gives him "a morphia hypodermically." This last is a good long word of no less than six syllables, but it is a pity that it is not to be found in ordinary dictionaries. He has, indeed, many of what may be called "the notes" of a hero; but then he is without a heroine till almost the end of the book, when a Maud or an Ethel—we forget which—is suddenly found for him. The real hero, for at least half the book, is a German poet. He, it is clear, is the man after the author's heart. She had, we believe, half intended to let him marry and be happy; but young writers—above all, young lady writers—too often cannot resist the temptation of killing off their favourite characters. So the unfortunate Rudolph von Stein joins the German army at the outbreak of the war, and is killed at the siege of Paris. The reader could have spared him much earlier, for he is not made away with till he has had time to write a great deal of poetry. Of his poems an English version is given in a footnote. The two following stanzas will perhaps reconcile our readers to the untimely death of the bard:—

> Thou art as fair's a floweret,
> As meek, and mild, and true,
> Beaming beneath the sunlight,
> As bright in meadow's dew.
>
> Fairer than fairest roses
> In speechless beauty still,
> Thy eyes alone are telling
> The wonders of thy will.

When he disappears there is happily no need for the heroine to follow him. She had refused to engage herself to him, alleging as her reason the fact that her father had died in a mad-house. This difficulty is, however, got over later in the story, and she marries a medical man. In this worthy gentleman there was, so far as we can call to mind, nothing more remarkable than an enjoyment of light comedy, and a capability of laughing heartily even at tolerably extravagant farce. Buckstone amused him infinitely. His acquaintance with Shakspeare could scarcely have been very accurate. At all events, he makes what seems to be a very singular adaptation of a well-known passage. He had asked the heroine in token of forgiveness to shake hands; she consented. "It was mad presumption," he said, "to ask her hand, but she gave it me and 'all the perfumes of Arabia are not sweeter than that little hand.'" It would seem as if he had a liking for tragedy as well as comedy and farce, and had a confused recollection of Lady Macbeth. It too soon becomes clear that the German poet is not meant very long for this world. The heroine's brother had, the very first time he met him, an instinct against speaking to him. Moreover, he shivered just after speaking to him. Von Stein himself was haunted with a foreboding that something was going to happen, and at once took to writing verses. He shuddered and shivered and more than once felt that some one had that moment walked over his grave. He discovered at last that it was the heroine's brother who had thus walked. "And yet," he exclaimed, "he is a man I could have loved." To have a capacity for loving a man who walked over his grave some months before he was buried showed that he had about him not a little that was heroic. He is, as we have said, killed at Paris, but has time before he dies to send off some farewell verses to the heroine in England.

With his departure the real interest of the story begins. The wicked uncle shows signs of his uneasiness. He tries to soothe his conscience by presents to his injured nephew and niece, which are always returned. The reader is let into long-buried secrets. A diary which had been kept, most conveniently for the plot, by a man on his death-bed is discovered. An old woman turns up from Australia, after an absence of thirty years, and brings with her the remaining fragment of a will which the wicked step-grandmamma had meant to burn. She goes to the wicked uncle, and tells him what she knows:—

> For a moment a fiend seemed to take possession of Lionel. He flew at the miserable old woman, and seizing her by the throat, held her, gasping for breath.
>
> "Dare to utter those words again, and I will shake every breath out of your wretched body," he hissed. "Miserable old hypocrite! How dare you come fawning to me, only to breathe slanders against the dead? Do you think that will serve the living, or bring you peace and competence in your old age?"
>
> "Mercy! Mercy!" she gasped.
>
> "There—say your prayers," he cried, suddenly letting her drop, and turning away to wipe off the perspiration which stood in heavy drops on his forehead.

Old sinners of course cannot go on like that for any length of time when they are so near the end of the story as the uncle was. He goes to Switzerland, tumbles down in descending a glacier, is taken to an inn where, by a wonderful chance, the injured nephew and niece happen to be staying, makes a full confession, and dies penitently. In his will "he bequeaths Netley

* *Brother and Sister.* By Lucy Scott. 2 vols. London: Macmillan & Co. 1878.

Hall, with all its revenues and encumbrances," to the rightful owner, Walter Ravenscroft. The encumbrances he might perhaps have left to take care of themselves; but the author no doubt wished to give her language a legal turn. The hero—if indeed the nephew is the hero—is not so forgiving as he ought to have been. He has the remains of his wicked step-grandmamma removed from Netley Church and taken to Kensal Green Cemetery. No doubt he was the squire of Netley; but even squires in their own parishes are bound by the law, and cannot quite so easily disturb the graves of their enemies. Besides, Netley had been bequeathed to him with all its encumbrances, and amongst these he ought surely to have reckoned the remains of his penitent uncle's impenitent mother. However, he was, we must remember, a man of weird aspect, and like a sable cloud. Besides that, he was for a long time a clergyman, and now, turning layman, he had become a squire. He had certainly left off taking opium, and had become engaged to a Maud or an Ethel. Nevertheless, his conduct was still likely to be at times eccentric; and, if he committed sacrilege, at all events he was not guilty, like the German, of writing verses.

AMERICAN LITERATURE.

WE regret to learn that the author of this laboured and heavy —we cannot call it elaborate or weighty—treatise on the Civil Service of Great Britain (1) is the Chairman of the Commission to which General Grant, under an Act of Congress passed in 1871, entrusted the preparation of rules and regulations supposed, if not intended, to effect the one great reform upon which all Americans, except the politicians, are agreed, and which it would seem that nearly all professional politicians of both parties are equally resolute to defeat, if not openly to oppose. From the first page to the last the book is characterized by all the worst faults of the second-rate American critic of English institutions. Such an American, sent to this country expressly to find in one part of its administrative system a model on which to reform the worst part of the political structure of the United States, can of course lose no opportunity of sneering at what he does not understand, of imputing motives, of vilifying classes, of depreciating the very merits of which his mission is an enforced acknowledgment. Mr. Eaton begins with a radical misconception of the very question he was sent to investigate. There is not, and never has been, in this country, anything like what he calls "the spoils system" of political nomination to the Civil Service. He applies that phrase persistently to practices which never bore the slightest resemblance to that which, under the phrase "To the victors belong the spoils," has been since General Jackson's time the opprobrium of the United States. An official entrusted with the formation of a scheme for the correction of that grand abuse, who sets out with the determination to represent the appointment of civil servants in the first instance by party and personal patronage as exactly equivalent to the periodical clearance of civil offices to make room for the adherents of the victorious faction, displays an utter ignorance of his subject. Ever since England has had a distinctive Civil Service it has been the point of honour of permanent officials to cease from the moment of their appointment to be party men, as it has been the rule of their political superiors to treat and trust them as servants, not of a party, but of the Crown. It is the misfortune of Republics to have no authority placed, like the Crown, above party influence or superior to mere party motives. It may be on this account the more difficult to preserve freedom from partisanship in a service which can look up to no non-partisan chief. But to represent the periodical "clean sweep" of the whole official body of the Federal Government, from Secretaries of State to local postmasters—the system of rotation in office—as analogous to anything that has prevailed in England since the Revolution, is to falsify all the facts of the case. Again, to call the system of competitive examination the "merit system" is to misrepresent all the reasonings of its opponents, which were based on the allegation that examination was no decisive test of merit. Indeed one paramount object of the conservative section of the official world, while the question was still open, was to prevent the supersession of proved merit by literary cramming—an object which they did to some extent accomplish by the drag which their experience and the reasonings drawn from it imposed on the rash enthusiasm of the innovators. It is needless to say that such a critic wholly ignores the fact that practical English sense refuses to apply the competitive system to those offices in which personal character and capacity are of supreme importance. But perhaps the worst feature of the work is the persistent vituperation of those who resisted the competitive system. Whatever may be thought of the merits of the controversy, only profound ignorance or unscrupulous partisanship can have suggested what Mr. Eaton throughout assumes—that the opposition of the permanent officials was otherwise than disinterested, and based upon practical considerations affecting solely the good of the service. That a mere politician, appointed to the Chairmanship of a reforming Commission by a President who carried the abuse to be reformed to its extreme height, should be mistaken on such points might seem a matter of course, and would hardly be worth noting if Mr. Eaton did not lay stress on the opportunities he has enjoyed of acquiring real knowledge of those facts of English life and administration of which he is most signally ignorant. The value of the treatise from an American point of view may be judged by one single fact. The warmest American reformers would be well content with that old English system against which the book is one long invective. What Mr. Eaton represents as closely analogous with the abuse to be reformed would almost content the highest aspirations, would more than satisfy the utmost hopes, of those who are labouring to correct it.

"The Army of Virginia" (2) is, no doubt, the correct technical title of that force which for a few months in 1862 served, and was signally beaten, under General Pope, the then favourite of the Federal War Office, as distinguished from the Peninsular army under command of McClellan. But probably to nine in ten Americans, certainly to all English and European readers, the Army of Virginia is not that Federal force whose commander first introduced the practices of plunder and arson which afterwards disgraced the conduct of the war on the Northern side, but that which, first under Beauregard, then under Joseph E. Johnstone, afterwards under General Lee, defended the Old Dominion against the successive waves of invasion under McDowell, McClellan, Pope, Burnside, Hooker, and Grant. There is obvious unfairness in this technical appropriation of a name which belongs to an army whose fame and cause were as opposite as possible to those of the force of which Major-General G. H. Gordon is the historian, if not exactly the panegyrist. It is noteworthy that the Army of Northern Virginia—such is the proper designation of the first and most famous army that defended the Southern cause—boasts a General Gordon, whose reputation bears to that of his namesake something like the same relation that the achievements of that army bear to those of Pope's command. General Pope was selected for no merit that either the enemy or his own countrymen knew of, except that of boasting more loudly of smaller achievements than any other soldier in a service which counted Banks and Butler among its distinguished commanders. If it be true that the Federal soldiers nevertheless did some things which deserve commemoration, the repute of those who served in that brief and luckless campaign can only be redeemed by showing, what we must admit their historian labours persistently to show, that under such a chief no army could have escaped disastrous and overwhelming defeat. We should, however, note two redeeming merits in this panegyric on a force whose component parts would probably prefer that this brief and inglorious episode in a struggle, not generally inglorious for either side, should be forgotten. The writer speaks with soldierly respect of the Confederate troops and their distinguished leaders, and does justice to the most grievously wronged of Federal commanders—the General who, more hampered and hindered by his own Government than baffled by his opponents, nevertheless organized for the first time the armies of the Union, led one of the best of those armies to some of its not least honourable battlefields, extricated it from a position in which its total destruction by inferior numbers appeared but too probable, saved the Federal cause at Antietam, when President Lincoln was forced to supplicate the aid of the man whom he had throughout thwarted and disgraced, and carried with him into retirement the admiration and gratitude of every soldier who served under him. We trust that history will one day do full justice to General McClellan. Treated as Grant and Sherman were treated, he would probably have eclipsed both; and but for him neither of them would have had an army capable of the exploits by which the fame of both was won. The result of Major-General Gordon's narrative is, we think, rather to intensify the ridicule already attached to the name of his unlucky commander than to redeem the credit of his comrades.

Judge Caton (3), ex-Chief Justice of the Supreme Court of Illinois, appears to have been on the whole a more moderate and more respectable politician than most of those who took any active part in politics during the period immediately preceding and following the Civil War. He belonged to that section of Northern Democrats whose attachment to the Union was proved by the loyalty with which, despite discouragement, insult, and at last deliberate bad faith on the part of their opponents in power, they adhered to the Federal cause during the war, and supported a Government whose conduct they could never have approved. But the few political papers contained in this collection of the Chief Justice's writings have now little other interest than attaches to distinct and trustworthy statements of the impression made on his countrymen by the professions of President Lincoln during the first two years of the war, and of the objects with which the war was undertaken by the great majority of the Northern people, and probably by their rulers. From the first, the English partisans of the North represented President Lincoln and his Cabinet as waging war on slavery; and his panegyrists since 1865 have asserted the same thing yet more strenu-

(3) *Miscellanies.* By John Dean Caton, LL.D., ex-Chief Justice of the Supreme Court of Illinois, Author of "A Summer in Norway," &c. Boston: Houghton, Osgood, & Co. London: Trübner & Co. 1880.

ously. It is worth repeating, even now, that those who take this view inflict upon the President and his advisers the stigma of deliberate and systematic falsehood. Mr. Lincoln denied over and over again, in the most absolute terms, that he had any intention of meddling with slavery in the Southern States. He acknowledged that he had no right to do so; he appealed to the Northern people on the ground that he would not, that he did not dream of so doing; that he waged war for the Union, and for the Union alone; for the Union with slavery, if the Southern States could be brought back in time; for the Union without slavery, if the destruction of slavery were necessary to the salvation of the Union. Only by these protestations did he obtain the confidence and support even of the Republican majority; without them, he would have been opposed by the votes, very probably by the arms, of the entire Northern Democracy. Without them, therefore, he and his Government would have been crushed at the outset. We believe, as did Judge Caton, that Mr. Lincoln was perfectly sincere; that he cared very little about slavery; that, like the War Democrats, he regarded as his first and paramount duty to preserve the Union of which he was the chief magistrate, with very little regard for any law or right that stood in the way. What was the real necessity, the *sine quâ non*, if not the cause, of the Northern determination to maintain the Union at all costs and hazards, is well set forth by Judge Caton. In 1860 the centre of gravity of the North lay west of the Alleghanies, lay in the great body of Prairie States between the Lakes and the Ohio. Of those States the Mississippi was the natural outlet; and to let the Lower Mississippi fall into the hands of a foreign, a rival, and possibly a hostile Power was a sacrifice to which no nation and no statesman could be compelled by anything but superior force. The Prairie States, in truth, are the political and social keystone of the Union. They can dispense neither with the Atlantic nor with the Gulf States, and are strong enough for the present, probably for long years to come, to hold together these antagonistic and independent elements. The most interesting, however, of Judge Caton's essays have no relation to politics. He appears to have been a close and thoughtful observer of natural phenomena, and his descriptive papers on the Hawaiian volcanoes and on the formation of the prairie, which he ascribes to the destruction of trees by fire, as well as a sympathetic and touching paper on the fate of the great Indian tribe of the Illinois, and the doom of the Red Man generally, are more valuable than his political lucubrations can have been even at the time of their first appearance.

Shakspeare resembles Homer in the misfortune of being so overlaid by layer after layer of comment, the race of commentators multiplying and spreading in each successive generation, that there is no little risk lest ere long the original dramas should lose their hold, not on fame, but on real popularity, by the size of that mountain of comparative rubbish beneath which they are in danger of being buried. Any man of ordinary intelligence can read and, in a general way, understand Shakspeare. But no such man, unless possessed of more than ordinary courage, will long venture to have an opinion of his own upon the merits or meanings whereupon so many volumes have been written to so little purpose. The least offensive of commentators, but perhaps the most mischievous to the permanent popularity of their author, are those who collect either "beauties" or passages supposed to illustrate particular merits, and thus enable the indolent reader to think and talk as if he were familiar with works of which he has read only scattered and ill-combined fragments. Mr. Gilman's panegyric and "suggestive selections" (4) profess to illustrate the morality of a dramatist who no doubt was in his time a sufficiently honest man, but who was far too true to his art to affect the moralist. A much less pretentious—perhaps somewhat less readable—production of the same kind (5) contains, in a pamphlet printed in the closest type on the thinnest paper, the miscellaneous remarks of an anonymous commentator on passages that have suggested to his mind criticisms more or less practical, more or less uninteresting, and hardly more attractive perhaps in substance than in appearance.

We may note, but need not dwell upon, two public documents of considerable importance and interest in their respective ways. The Comptroller of the Currency has put forth in pamphlet form his Annual Report for 1879 (6), showing how easily and completely the resumption of specie payments has been accomplished—the one great service which since the war has countervailed the manifold demerits of the party in power. The Report of the Commissioner entrusted with the supervision, or rather the inspection, of Fish Culture and Fisheries in the waters of the United States (7), has many interesting facts to tell; but these are so overlaid by a mass of uninteresting details—for instance, 450 pages are given to the natural and industrial history of the menhaden, a fish chiefly used for manure—that few will have the courage to hunt them out.

(5) *Scattered Notes on the Text of Shakespeare.* Philadelphia: Wilson & Co. London: Trübner & Co. 1879.

(6) *Annual Report of the Comptroller of the Currency to Congress, 1st December, 1879.* Washington: Government Printing Office. London: Trübner & Co.

(7) *United States Commission of Fish and Fisheries.* Part V. *Report of the Commissioner for 1877.* Washington: Government Printing Office. London: Trübner & Co. 1879.

The large share taken by Frenchmen in the discovery of North America is little appreciated, probably because, of the European nations among whom the New World was at first divided, France alone retains none of the possessions bought with much blood and treasure. Mr. Parkman has done good service to the history of his country, as well as justice to the memory of many enterprising men, and to the energy of a nation which at one time seemed likely to rival England at once in the East and the West, in more than one former volume relating the adventures of French missionaries and explorers. The work of which an eleventh edition is now offered to the public (8) is probably already known to many of our readers; but its issue in a new and revised form has given the author an opportunity of rendering fuller and well-deserved honour to the name of La Salle, the original discoverer, or at least the first explorer, of the Missouri and Mississippi.

It is impossible in this place to do more than mention a work so elaborate and so valuable as Mr. Short's *North Americans of Antiquity* (9), a complete account of the various prehistoric civilizations of the North-Western continent, from the mound-builders of the region between the Lakes and the Ohio to the founders of the lost cities of Central America. We hope to return to it on a future occasion.

Professor Anderson, of the University of Wisconsin, has done not a little to familiarize the rising generation of Americans with the early history of the most daring and adventurous branch of the great race from which they descend—those Scandinavian sea-rovers of the middle ages, to whom, not without more than mere legendary ground, the first discovery of North-Eastern America is ascribed. His translation of many parts of Snorre's or the prose *Edda* (10) will prove, we doubt not, as attractive as any of its predecessors, and may do as much as his sketches of their history and mythology to render the heroic and poetic character of the sea-kings and their followers intelligible to American as well as to English readers.

A-ló-ha! (11) a word signifying welcome in the Hawaiian language, furnishes the title of a readable and not over-lengthy account of a family visit to that most interesting among the numerous island groups of the Pacific archipelago.

Mr. Knox's *Boy Travellers* (12) is a more ambitious, but not more readable, work, a sort of geographical *Sandford and Merton*, in which the adventures and questions of two young travellers in China and Japan afford their elders occasion to dilate, often at somewhat wearisome length, upon the history, politics, and antiquities of two of the oldest nations of the East, among the last to which the commerce and diplomacy of Europe have forced an access.

A series of Health Primers, put forth by a Philadelphian publishing firm, contains two tolerably readable as well as useful little treatises on the influence of summer and winter respectively on human health (13, 14), and the precautions obviously required and generally neglected against the extremities of either season.

Poets' Homes (15) does, at greater length and evidently with a perfect unconsciousness of impertinence, for the dwellings and private life of the most distinguished, and one or two not very distinguished, American poets, what our "society" journals have recently done, or affected to do, for celebrated or notorious English writers.

The biography of Mr. Octavius Perinchief (16) sets forth at enormous length the religious and practical experiences of an earnest, but by no means very eminent or generally known, pastor and preacher of the present generation.

Mr. Winsor's Handbook of the American Revolution (17) is an account of the most important and exciting episode in the history of the New World, so arranged and so written as to render the story of the War of Independence repulsive even to the ardent patriotism of American schoolboys. It may perhaps have the good effect of associating the 4th of July in the minds of some of the

(8) *La Salle and the Discovery of the Great West.* By Francis Parkman, Author of "Pioneers of France in the New World," &c. &c. Eleventh Edition, revised, with additions. Boston: Little, Brown, & Co. London: Sampson Low & Co. 1879.

(9) *The North Americans of Antiquity; their Origin, Migrations, and Type of Civilization Considered.* By John J. Short. New York: Harper Brothers. London: Sampson Low & Co. 1880.

(10) *The Younger Edda: also called Snorre's Edda, or the Prose Edda.* An English Version, with Introduction, Notes, and Vocabulary, by Rasmus B. Anderson, Professor of the Scandinavian Languages in Wisconsin University. Chicago: Griggs & Co. London: Trübner & Co. 1880.

(11) *A-ló-ha! a Hawaiian Salutation.* By G. L. Chaney. Boston: Roberts Brothers. London: Sampson Low & Co. 1880.

(12) *The Boy Travellers in the Far East: Adventures of Two Youths in a Journey to Japan and China.* By T. W. Knox, Author of "Overland through Asia," &c. Illustrated. New York: Harper Brothers. London: Sampson Low & Co. 1880.

(13) *American Health Primers.—Winter and its Dangers.* By Hamilton Osgood, M.D. Philadelphia: Lindsay & Blakiston. London: Trübner & Co. 1879.

(14) *The Summer and its Diseases.* By Hamilton Osgood, M.D. Philadelphia: Lindsay & Blakiston. London: Trübner & Co. 1879.

(15) *Poets' Homes: Pen and Pencil Sketches of American Poets and their Homes.* By R. H. Stoddard and others. Boston: Lothrop & Co. London: Sampson Low & Co.

(16) *Octavius Perinchief; his Life of Trial and Supreme Faith.* By Charles Lauman. Washington: J. Angbin. 1879.

(17) *The Reader's Handbook of the American Revolution, 1761–1783.* By Justin Winsor, Librarian of Harvard University. Boston: Osgood, Houghton, & Co. London: Trübner & Co. 1880.

rising generation with recollections even more wearisome than those of antiquated rhetoric and exaggerated boasting.

Of verse we have no fewer than five volumes, none of them of the highest order of merit. The list includes a solid volume under the title of *Thou and I* (18), by Mr. Theodore Tilton, a well, if not very pleasantly, known name; some new poems by Mrs. Piatt (19); a duodecimo, whose size is due rather to the excellence of the type than to the quantity of matter contained, by Nora Perry (20); and a collection of pieces, mostly brief and spirited (21), by a young Marylander whose sympathies seem to be divided between the section to which his State belonged and the cause of the Union, but who writes with heart and spirit when he takes for his theme the less familiar episodes of the Revolutionary war in which citizens of Maryland took a leading part. Mr. Peterson's *Cæsar* (22) is a poetic glorification of the great demagogue, dictator, soldier, and statesman by whom the Roman Republic was finally overthrown. Those who have studied without prejudice the later history of that Republic may think its destruction no great offence against the interests of humanity; but it is a somewhat curious subject of American eulogy.

The American press is almost as prolific of monthly and other magazines as of daily and weekly journals, but none have reached the influence or popularity of the leading English monthlies and quarterlies. Among the best is the *North American Review* (23), the number of which for November, 1879, contains, with some not very interesting political papers, some passionate diatribes on the Other—that is to say, the "strong-minded"—Side of the Woman Question, by five of its most passionate advocates of either sex. *The United Service* (24) may fairly claim to rank with its elder brethren on this side of the Atlantic devoted to the interests of the same professions. *The Californian* (25) is a magazine of the livelier class, filled chiefly with interesting tales and sketches, among which, however, are one or two papers of graver value, all bearing unmistakably the stamp of that peculiar humour which characterizes the young community—we might almost call it a new nation—growing up under the Federal flag upon the Pacific coast. Among purely professional publications, *The American Journal of Otology* (26) (or of Acoustics and Aural Surgery) appears to possess a genuine practical and scientific value. *The American Art Review* (27) contains some valuable and interesting illustrations well explained by the accompanying text. The *Journal of Mathematics* (28) has been noticed in our columns on a former occasion; we will only say now that its style and execution indicate a "recklessness of expense" which would seem to suggest that its editors appeal to a not inconsiderable public.

(18) *Thou and I: a Lyric of Human Life; with other Poems.* By Theodore Tilton. New York: E. Worthington. London: Sampson Low & Co. 1880.

(19) *Dramatic Persons and Moods; with other New Poems.* By Mrs. S. M. B. Piatt. Boston: Houghton, Osgood, & Co. London: Trübner & Co. 1880.

(20) *Her Lover's Friend; and other Poems.* By Nora Perry. Boston: Houghton, Osgood, & Co. London: Trübner & Co. 1880.

(21) *Lord Stirling's Stand; and other Poems.* By W. H. Babcock. Philadelphia and London: Lippincott & Co.

(22) *Cæsar: a Dramatic Study.* By Henry Peterson, Author of "The Modern Job," &c. Philadelphia: Peterson & Co. 1879.

(23) *North American Review.* November, 1879. New York: Appleton & Co. London: Sampson Low & Co.

(24) *The United Service.* January, 1880. Vol. II. No. 1. Philadelphia: Hamersly & Co. London: B. F. Stevens.

(25) *The Californian.* January, 1880. San Francisco: The A. Roman Publishing Company.

(26) *The American Journal of Otology.* July, 1879. Vol. I. No. 3. (Quarterly.) New York: Woods & Co.

(27) *The American Art Review.* Vol. I. No. 2. Boston: Estes & Lauriat. London: Sampson Low & Co.

(28) *American Journal of Mathematics, Pure and Applied.* September, 1879. Vol. II. No. 3. New York: D. Van Nostrand. London: Trübner & Co.

THE MEETING OF PARLIAMENT.

THE Ministerial and Opposition leaders in both Houses performed their recognized duties in the debate on the Address in strict conformity with established precedent. The Duke of ARGYLL alone attempted to deviate from the moderation of which Lord GRANVILLE had set the example. Little disappointment has been caused by the omission of the Ministers to make any new or startling communications. It is usual on the first night of the Session to inform Parliament that papers will be distributed for general information, and to deprecate discussion which, in the meantime, will be premature. Lord BEACONSFIELD, though he professed to be surprised by Lord GRANVILLE's criticisms on the Treaty of Berlin, was perhaps not displeased with the prominence given to a topic which has long ceased to be exciting. It would be difficult to disturb the equanimity of any audience at the present moment by an inquiry whether the English plenipotentiaries a year and a half ago brought back peace with honour. No overwhelming curiosity is even felt as to the delimitation of Montenegro, though Lord BEACONSFIELD wisely answered a grave question asked by Lord GRANVILLE on the subject. It is generally known that, in that rugged and turbulent region, a triangular or polygonal quarrel is still undecided. The Albanians, who are as warlike and nearly as independent as the Montenegrins themselves, have offered an active resistance to the surrender by Turkey of a certain district which they claim as their own. The Porte seems for once to have acted in good faith, and the Turkish Commissioner has made some approach to a settlement of the dispute. The Montenegrins have, by the Treaty of Berlin, acquired a considerable increase of territory; but, on the other hand, they have become much less interesting since they have lost the power of disturbing the peace of Europe by their feuds with their neighbours. Henceforth they will have to deal with Austria instead of with Turkey, and probably they will find it expedient to abstain from disturbance. Lord BEACONSFIELD says that the controversy is likely to end in a satisfactory conclusion; and the House of Lords was apparently not anxious to elicit further information. The much more important difficulties which have arisen in the settlement of the Greek frontier appear also to approach a solution. The Turkish and Greek Commissioners have alternately made inadmissible proposals, and there seemed to be little hope that they would arrive at a conclusion. In these circumstances M. WADDINGTON suggested an International Commission; and his successor has since intimated his concurrence. Lord SALISBURY has accepted the proposal; and it may be assumed that the matter will practically be taken out of the hands of the principals in the transaction. If the Turks were capable of understanding their own interest, they would welcome the termination of the dispute; and they would not even grudge the aggrandizement of a neighbour whose interests are likely to coincide with their own in resistance to foreign aggression.

The Turkish Convention and the acquisition of Cyprus furnished the Opposition with a familiar subject of censure; and the Duke of ARGYLL, with questionable judgment foretold, and therefore invited, the seizure by Russia of the whole or part of Armenia and Kurdistan. It is scarcely probable that the policy of Russia will be determined by the tenor of partisan speeches in England; but a statesman of the Duke of ARGYLL's official rank ought not to provide excuses beforehand for measures which might probably involve war between Russia and England. The imprudence is the less excusable because, as the Duke of ARGYLL must be aware, his voluminous pamphlet on foreign and Indian affairs has already supplied Russian apologists with arguments in defence of measures which are adverse to English interests. Lord HARTINGTON, in more moderate language, repeated objections to the Convention and to the acquisition of Cyprus which have never been sufficiently answered; and he was fully justified in condemning the continued misgovernment of Armenia and Asia Minor. The CHANCELLOR of the EXCHEQUER confessed his inability to defend the Turkish Ministers; but he referred with good reason to the opposition which the English AMBASSADOR, under the direction of the Government, has, in season and out of season, offered to the crimes and follies of the Porte. As long as KHAIREDDIN was in office Sir H. LAYARD apparently made some progress in inducing the Turks to begin the promised reforms. The present Ministers — who enjoy in a much higher degree than their predecessors the favour of the SULTAN —appear to be thoroughly hostile to English influence, which is identified with the welfare of the subject population. The best extenuation of the evils of the Convention is that they might in any case have occurred, because in the absence of written obligations the English Government would have endeavoured to save Turkey from destruction by promoting improvements which offer the only chance of safety. The motives of England are well understood at Constantinople, and they are fully appreciated by the victims of oppression in Asiatic Turkey. There is no want of evidence of the trust and gratitude which have been produced by the incessant and benevolent remonstrances of the English authorities.

The most important Ministerial statement was the admission by Lord BEACONSFIELD that the Afghan war may, perhaps, result in the dissolution of the monarchy. It is well known that, as he said, the union of the Afghan territory under a single ruler only dates back two or three generations; but when the policy of the present Government first superseded the inaction of their predecessors, there was no thought of breaking up the kingdom of DOST MOHAMMED. As the Opposition speakers pointed out, a country divided among several chiefs could scarcely have a foreign policy to be controlled by the Indian Government; and, it may be added that petty potentates regarding one another as rivals would be habitually open to foreign intrigues. The settlement which Lord BEACONSFIELD indicates may perhaps be unavoidable; but it is not in itself desirable. It may be hoped that he was well informed in his belief that some of the principal chiefs are not unfriendly to the English. They may probably be hesitating until they are assured of protection on the withdrawal of the English army. As might have been expected, the Ministers were unable to inform Parliament whether there was any prospect of an early evacuation of the territory which is controlled by the army. There will be an early discussion of the whole subject; and perhaps by that time the course to be pursued may have become clearer. The Government will also have received full information as to the executions which took place some time since at Cabul. The instructions of the VICEROY to the military commanders

appear to have been wholly unobjectionable. The only criminals designated for punishment were accomplices in the conspiracy against the Envoy, or in the attack on the Residency. The General in command was specially warned to exercise his personal discretion in administering punishment, and not to devolve the responsibility on subordinates. The language of Sir F. ROBERTS's proclamation is less satisfactory; but Lord CRANBROOK appears to be satisfied that no Afghan has been sentenced to death for armed resistance to the invader. In expressing the same belief, Lord BEACONSFIELD can scarcely have foreseen that he would be exposed to an ill-natured and ill-bred taunt consisting in a reference to the language which he used on the first rumour of the Bulgarian massacre.

No direct answer was given to the inquiry whether it is proposed to retain possession of the Transvaal. The Government is quite right in reserving to itself for the present the decision of a difficult question. One element of deliberation will be the wish and opinion of the Parliament of the Cape. A despatch has been received from Sir BARTLE FRERE which shows that the colony is at length inclined to discuss the terms of a South African Confederation. In the scheme which has been approved by Sir BARTLE FRERE's Ministers, the Transvaal is allowed a certain proportion of votes, so that the project must have been founded on a belief that the Republic would not be re-established. There will probably be debates in both Houses on a question which involves many difficulties. It would be desirable that Lord CARNARVON, who is principally responsible for annexation, should state whether his opinion has been changed by later events. It happens that Parliament at first approved the measure almost without discussion. It is scarcely a sufficient excuse for those who now disapprove of the policy of the Government that they were misled by inaccurate representations as to the feeling of the Boers. The acquiescence of the people of the Transvaal may have been too hastily taken for granted; but, on the other hand, it is doubtful whether they really objected at the time to a measure which ensured their protection against a formidable enemy. No objection can be taken to temporary reserve on the part of the Government.

HOME LEGISLATION.

THE Government cannot be reproached with having offered at the opening of the Session one of those ambitious and exhaustive programmes of domestic legislation which are doomed to certain failure, and the failure of which brings discredit on their authors. The Criminal Code and the Bankruptcy Bill are two measures of cardinal importance which the Government does not so much introduce as carry over from last Session. In one respect, however, the Government has made a useful change in its method of dealing with its two principal measures. Both are to be started in the House of Commons, and the ATTORNEY-GENERAL is to be charged with them. Experience has shown that it is of no use to begin a Bill like the Bankruptcy Bill in the House of Lords. The Peers play with it for a time, but do not care to criticize or improve it. There is no one to point out how the provisions of the Bill will really affect the classes whom it professes to aid or control, and at the end of two or three months the Bill comes before the Commons as a new Bill. It is simply the measure of the Government, and all that is known beyond is that the Bill, if approved by the Commons, would be approved by the Lords. This may be confidently said of any Bill approved by the CHANCELLOR, and it is useless to waste time in proving what may be safely assumed without proof. There ought not to be any great difficulty in getting a reasonable Bankruptcy Bill through the Commons, for the mercantile community, irrespective of party, earnestly desires such a Bill, and the abuses denounced last year by the CHANCELLOR are so flagrant and so indisputable that no one can deny that, if Parliament is to legislate at all, they ought to be stopped at once. The Criminal Code is a measure more difficult to pass; for, if its details are criticized, criticism will be endless. On the other hand, it would be rash to calculate that the House of Commons will accept a proposed Code so intimately affecting the liberty of the subject without looking into it. The difficulty is to devise a mode by which the House shall look into the Code sufficiently to discharge its duty of investigation, and yet not so jealously and minutely as to stop the progress of the measure. In the ordinary course of things such a Bill would be referred to a Committee; but a Committee is usually a body so arranged that the Government has a small majority in it, the end of all discussion being that what the Government thinks right is carried by the majority, and what the minority thinks right is reserved for discussion in the House. A Committee thus composed would carry the Criminal Code a very short stage on its way to becoming law. But it is conceivable that a Committee might be composed, and might be so directed in its operations, that it would not consider whether it was defeating or supporting the Government, but what was for the public good. Everything will depend on the composition of the Committee and on the character and scope imparted and assigned to it. An exceptional Committee can alone deal with so exceptional a measure as a Criminal Code.

The minor measures announced by the Government are a Bill for enlarging the powers of life owners to sell, a Bill for consolidating and improving the Lunacy laws, and a Bill for simplifying conveyancing. The CHANCELLOR is the best judge of what reforms are needed in a matter so entirely within his province as the Lunacy laws; and there is so small a prospect of any hostility to a reasonable measure about lunatics, that the only cause of wonder is why it was thought necessary to put such a measure into the very limited list of Government proposals. Perhaps it was introduced to give beforehand a sort of contagion of mildness to the other two proposals between which it was inserted. The Government may have wished to hint that it would do something towards altering the Land laws, but that it was going to do very little. The enlargement of the powers of life tenants is a very small and unobjectionable proposal, but the simplification of conveyancing may mean anything. The CHANCELLOR will have an opportunity of stating his most recent views as to the possibility of giving increased facilities for the transfer of land, and this may be all that the Government considers necessary. It is probable that before long there will be a real separation between parties as to some of the numberless questions which any system of ownership of land must suggest, and the Government may desire not so much to pass particular measures regarding land as to clear its own ground, and relieve itself from the responsibility of seeming to maintain that everything is perfect in a system which in the main it wishes to see maintained. There are many other measures not noticed in the Speech which the Government must introduce or will probably introduce. But, either they are measures in the regular course of business, like the continuance of the Ballot Act, or they are measures like the revision of the Corrupt Practices Act, which every one agrees it would be desirable to get through before a dissolution, but as to the carrying of which the Government may think it imprudent to pledge itself. The Government knows that it is impossible to say what turn things will take in any Session, and what amount of time it will have at its disposal. The countless notices of private members might seem to show that they at least think that the time which Parliament has to give them is unlimited; but the bulk of these notices may be regarded as being principally intended as election addresses. The enterprising member hopes that his enterprise will be remembered in his own little sphere if it remains unnoticed in the large arena of Parliament. It is something for a candidate to be able to explain what great things "my Bill" would have effected if only Parliament could have been got to listen to it.

The harmony of the meeting was not quite uninterrupted during the first night of the sitting of the Commons. The usual review of the policies of the Government and the Opposition was gone through with the proper observance of the ceremonies befiting the occasion. But the Irish longed for a fight too ardently not to create some occasion for it. Mr. SHAW proposed to move an amendment to the Address, imputing the present miseries of Ireland to the criminal neglect of the Government. There was no technical objection to such an amendment. The Speech referred to the distress in Ireland, and any one who chose to take the responsibility might insist that the Address should notice the true causes of this distress. Directly the seconder of the Address sat down, Mr. SHAW was ready to bring forward his amendment; but the SPEAKER could not catch the eye of any one but Lord HARTINGTON.

It is the business of the leader of the Opposition to criticize the Address as a whole, and it is evidently conducive to convenience that the general review of the Address should precede the attack of any one member on a special part of it. When the general consideration of the Address was over the time came for Mr. SHAW to move his amendment; but he would not move it. He and his friends proposed instead that the House should adjourn, on the ground that since the beginning of the debate a paper had been put into the hands of members which he much desired they should study before he tried to prove his case. To the adjournment on such a ground the Government reasonably objected, or seemed to object. Lord HARTINGTON strongly supported the Government, for reasons which seemed intelligible and just. The debate on the Address may be supposed to be confined to matters within the cognizance of Parliament at the time of its meeting, while the new matter which Mr. SHAW wished the House to study had been brought to the knowledge of Parliament in order to prepare it for the examination of a Bill which the Government proposes to introduce. Lord HARTINGTON was immediately made the object of violent attack by the Home Rulers, who said that he always deserted them when they wished him to lead them. It was very desirable that Lord HARTINGTON should have had an opportunity of showing that he is occasionally not afraid of them. But it turned out that he was more Ministerial than the Ministers themselves. With them it was a question of the most technical kind. They distinguished between a debate on the Address and a debate on the Report of the Address. On the occasion of the Report they were themselves going to introduce totally new matter, by making a full exposition of their views on Irish distress, and then Mr. SHAW could make any use he pleased of any materials he could get hold of. Mr. SHAW complained that, if the Government had but told him that they were going to put him in precisely the same position in all but a technical point as he would have occupied if the debate on the Address had been adjourned, he would not have wasted his time and that of other people in pressing for an adjournment. It is unfortunate that in any matter which touches the excited feelings of Irish members the Government should either not know its own mind or should be unable to make it clear what its mind is.

THE LIVERPOOL CONTEST.

THE Liverpool election would in any case have excited political attention and curiosity; but the interest of the struggle has been unexpectedly concentrated on the probable motives and consequences of Lord RAMSAY'S acceptance of the Home Rule test. The scandal would have been somewhat less flagrant if he had not changed his course in the middle of the contest. He in the first instance declined to vote for an inquiry into the proposed restoration of the Irish Parliament. He was willing to inquire into other Irish demands, but it was understood that he objected to the mention of a Parliament, which means the dissolution of the United Kingdom. Although the Irish vote was in consequence professedly withheld, Lord RAMSAY again and again assured his supporters that he was thoroughly satisfied with the prospect of his return. Since the coalition he has stated, probably on sufficient grounds, that, on the contrary, the state of affairs was then very gloomy. There is no doubt that his second version was true; for, if he had expected a majority of the English voters, he could scarcely have submitted to the degradation of retracting his former refusal. He now discovered that his objection was not to an Irish Parliament, but to a restoration of the old Irish Parliament, which no human being had at any time proposed. As one of the Home Rule speakers said, Roman Catholics and Dissenters were excluded from the Irish Parliament before the Union. Apparently Lord RAMSAY had fancied that the zealous Catholics who are now his welcome allies had asked him to assist in repealing Catholic Emancipation, as far as it affects Ireland. It is difficult to measure the ingenious credulity of a candidate determined to win. The Home Rule agitators are in no way responsible for Lord RAMSAY'S incapacity to understand their intentions. At Liverpool, as in Dublin and London, they have announced with perfect [illegible] that the Irish Parliament is to exercise exclu-[illegible]ol over all Irish affairs. It would probably commence the exercise of its functions by imposing prohibitive duties on English manufactures.

The distinction between a vote for an inquiry into the policy of separation and a vote for the actual establishment of an Irish Parliament is almost ostentatiously futile. Every man of ordinary intelligence is capable of judging, without the aid of evidence or argument, whether an Irish Legislature is compatible with the unity of the kingdom. If any theoretical doubt could have existed, it would be dispelled by reference to the history of Ireland during the only period in which it possessed legislative independence. The concessions of 1782, which were extorted by a display of armed force, were followed by the rebellion of 1798, and by the conviction of English statesmen that union was indispensable. The new Parliament which Lord RAMSAY contemplates would be much more unmanageable than the old. Before the Union the Government exercised much control over Irish members by the distribution of favours, places, and pensions. It would have nothing to give to the PARNELLS and BIGGARS of a new Parliament. The Chairman of the Liverpool Home Rule League said a few days ago that five-sixths of the members must be Catholics. It is more certain that the great majority would be enemies of the English connexion. To inquire whether such a measure is desirable is to allow that it is not essentially inadmissible. If Lord RAMSAY and those who accept similar pledges are convinced beforehand that the result of inquiry would be unfavourable to Home Rule, they are acting with bad faith to their new confederates. It is not necessary to discuss seriously commonplace fallacies, such as the proposition that the wishes of a large body of Liberals are entitled to examination. There is nothing to learn which is not known already, and the Home Rule party have proved that they are not in the ordinary sense Liberals by their refusal to vote on general grounds for the Liberal candidate. No political section can be recognized as entitled to moral weight which avowedly maintains a neutral position on all English and Imperial questions. It is intolerable that Irishmen who demand separation from Great Britain should control English elections. A body of Russian ratepayors settled in an English port might as reasonably claim to dictate the policy of a nation which they might professedly desire to injure and to weaken. They could scarcely improve on the hostility which is constantly expressed by the PARNELLS, the O'CONNOR POWERS, and the SULLIVANS. Lord RAMSAY, in courting the professed enemies of his country, cannot be surprised if he alienates the goodwill of Liberals who retain some patriotic feeling.

More important than the Liverpool election, and perhaps dependent on its result, is the policy of some of the Liberal leaders. It is improbable that a political novice, even though he may have just confidence in his own ability, should have ventured on the decisive step of a coalition with the Home Rule League without consulting persons of higher authority. Some principal members of the Opposition probably recommended an experiment which may be abandoned if the election proves that it was impolitic. Lord HARTINGTON has cleared himself from the suspicion of original and direct complicity in the Liverpool intrigue. It appears that Lord RAMSAY had not informed him of his intention, and Lord HARTINGTON adheres to his former refusal to accept the Irish pledge. It could perhaps scarcely be expected that the leader of the Liberal party should not desire the return of an avowed and able supporter; but nevertheless, by expressing a wish for Lord RAMSAY'S success, Lord HARTINGTON makes the repeal of the Union an open question. If advocacy of the disruption of the United Kingdom is no longer incompatible with the principles represented by Lord HARTINGTON, the Liberal party will be as responsible for the consequences as if it openly allied itself with the Home Rule League. Perhaps Lord HARTINGTON, though he is still leader of the Opposition, may not know whether he is to retain his position in a future Liberal Ministry. The candidate whom the extreme section of the party confessedly prefers has for some time past not repeated his disclaimer of willingness to resume office. It is not known whether Mr. GLADSTONE was one of those who advised Lord RAMSAY to give the pledge at a time when, as his subsequent confession shows, he had no other chance of success at Liverpool. It was probably in compliance with a request from Lord RAMSAY'S supporters that Mr. GLADSTONE has written a letter in support of his candidature, which includes no reference to the question on which the decision of the constituencies almost

exclusively depends. With feminine and almost hysterical vehemence Mr. GLADSTONE once more repeats the charges which he has repeatedly urged against the Government, from the frivolous crotchet about the duration of Parliament, and the obsolete grievance of Lord BEACONSFIELD'S empty mention of the Income-tax, to the more pressing and serious topic of the Afghan war. On the main issue of Home Rule he is suspiciously silent; yet he knows that Lord RAMSAY is the first member or candidate in Great Britain who has ventured to pronounce the formula devised by the Irish managers. One of the most active among them, Mr. SULLIVAN, who emulates Mr. PARNELL in violence of language, declared that he was himself a Nationalist, and he insinuated that Home Rule had been a temporary compromise between the Separatists and the English Conservatives. There is, in fact, no Home Rule party in Ireland, though the name is still retained for the purpose of negotiating with pliable candidates for large English towns. Mr. SULLIVAN and his friends, while they impose on Lord RAMSAY an obligation to vote for inquiry into the expediency of a subordinate Parliament, make no secret of their intention to achieve, if possible, absolute independence. The concession of a provincial Legislature, with nominally limited functions, would be gladly welcomed as a step to the attainment of their ultimate object.

A judicious adviser, though his warning might probably be neglected, would recommend the so-called Home Rule party to exercise a certain amount of self-denial during the present Session. The pleasure of obstructing public business would not compensate them for the irritation which their efforts might provoke in constituencies where they hope to decide doubtful elections. It was evident at Liverpool that dislike of Irish dictation has penetrated far down among the mass of the people. Mr. GLADSTONE'S hesitation or reticence may perhaps be explained by his experience of the advantage derived by his opponents from his harangues on Irish grievances during the general election of 1868. While his party obtained an overwhelming majority in other parts of the country, he confirmed the Conservative feeling in Lancashire which had been originally produced by a reaction against the followers of Mr. COBDEN. On some later occasions, as two or three years ago at Salford, the Liberal candidate lost his election because he had given pledges to the Home Rule party far less strong than those which have been exacted from Lord RAMSAY. If the Irish agitators make themselves more than ordinarily disagreeable in the House of Commons, they will both diminish their capacity for mischief at the election and discredit any members who may be thought to have owed their seats to Home Rule support. Recriminations against Conservatives who may, according to Mr. SULLIVAN, formerly have tampered with Home Rule, will produce little popular effect; though impartial politicians may deem their conduct more discreditable than the similar proceedings of their opponents. Mr. SULLIVAN'S statements, if they were true, would prove, not only that some members of the Conservative party had engaged in mischievous intrigues, but also that they had found willing accomplices and tools among the Home Rule managers. He apparently shares the general belief that a suspicion of connivance with Home Rule is likely to make a candidate or a political party unpopular in an English constituency.

THE SITUATION IN EUROPE.

THE dim prospect of a great war has overshadowed Europe for some months, and no one who has any acquaintance with the present state of the Continent would venture to prophesy that all danger of such a war is over. But there are symptoms which may tend to reassure those who need reassuring. The increase of the German army has been treated as totally unimportant everywhere except in Germany itself, where Count MOLTKE has had to explain to an inquiring peasant that not even "our EMPEROR himself" can remedy the corruption of human nature and make it inclined to peace and good will, and where, in Bavaria at least, a free opposition to the augmentation of military expenditure has found expression. Russian critics consider, or are ordered to consider, the increase as solely directed against France, and France has treated the news of more German soldiers being raised with perfect equanimity. It would be difficult to see how France could take umbrage at it. The French, in the first place, have no fancy for a new war, and have no more present intention of attacking Germany than of attacking England. And, in the second place, they must be supposed to know what they themselves are doing. They are going to spend over twenty-eight millions sterling on their army this year, and four millions more for material; while it is said that the autumn manœuvres are to be on a scale which will show what the strength and qualities of the army generally would be if it took the field. It is certainly not for France to complain or affect alarm if Germany makes a small addition to its standing force. Perhaps it may even be said to conduce to the prospects of peace that the minor confidants of Prince BISMARCK are allowed to renew vague hints of coming disturbance, and to disclose what they imagine should be the line of this or that State in cases which it pleases them to imagine. It is not inexpedient that outsiders should be placed on their guard. In a war between France and Germany it would naturally be the aim of Germany to act on the offensive. But, if Germany thought it expedient to take the offensive against Russia, there is serious reason for Prince BISMARCK and his friends to fear that France could not look on with indifference at the balance of power in Europe being disturbed to her lasting detriment. The French would obviously in such a case be in a much more advantageous position if they could take, or seriously threaten to take, the offensive. The ingenuity of Germany has thus been set to work to discover, if possible, some means of preventing France from assuming such a position, without Germany having to take any trouble or to spend a farthing to secure this object. The bright thought has occurred to a journal which is supposed to be "semi-inspired" that England would be a most useful tool for the purpose, and it has been gravely proposed that England should not only close every avenue by which French troops could get at Germany outside French territory, which is not perhaps going beyond the treaty obligations of England, but that England should protect the coasts of North Germany against the French navy. The suggestion is, from an English point of view, unworthy of discussion; but it deserves a passing notice as an indication of the direction in which the thoughts of the German war party are running.

Nothing can be less warlike than the tone of opinion in Austria. The representatives of Austro-Hungary will not listen to any proposal for adding to the military strength of the Empire, and it seems doubtful whether they can be got to vote the necessary funds for the defensive fortifications in which Austria is said to be deficient. The PREMIER is engaged in the difficult task of riding on two horses at the same time. He has got a coalition Cabinet, composed in almost equal proportions of what are termed Autonomists and Constitutionalists. By Autonomists are meant persons who want more Home Rule, although they do not know how much, and by Constitutionalists is meant people who think they have got quite as much Home Rule as they can stand. The Autonomists have a very small majority in the Lower Chamber, while the Constitutionalists have the Upper Chamber at their command. A Minister who has to lean on the support and play off the rivalries of parties so equally balanced is not likely to nourish grand schemes of external extension, or to take any step which one set of his friends would regard as too favourable to the other. Nor have the new commercial relations of Austria with Germany, the nature of which is still as much a secret as ever, diminished the desire of Austria to make herself in some degree independent of Germany by the construction of a railway which will place Austria in direct connexion with Switzerland. The cost of the line, which traverses or penetrates a high mountain range, will be heavy for a country so open to financial embarrassment as Austria; but Austria seems resolved to find the money at any cost. Everything seems to show that Austria will not go crusading beyond her Eastern borders, unless she is pushed forward by Germany. Whether she will be so pushed forward is the unsolved problem of European politics; but it is satisfactory to observe that she will need strong pushing before she runs the risk of going into new adventures. Italy, again, is not a very important Power, but still it tends to the tranquillity and reserve of Austria that Italy is now doing everything in her power to please Austria. A Ministerial circular has been issued directing the local

authorities to repress with firmness any manifestations of hostility to Austria; and it rather adds to the significance of the circular than detracts from it that Italian Ministries are not in the habit of issuing such circulars until they have satisfied themselves that the manifestations which they discountenance either will not take place or will be of trifling importance.

Whatever she may be doing or planning in Asia, in Europe Russia is keeping, to all appearance, as quiet as possible. Her internal troubles may reasonably engross her entire attention. What is the real state of things in Russia no one outside Russia, and probably very few in Russia, can pretend to say. In some ways, it may be surmised, her internal troubles have not as yet hurt her very much. She still manages to keep on foot her enormous army, on which she spent last year nearly twice as much as Germany spent on her army, and she still manages to keep up her financial credit, and Russian stocks are higher than when her internal troubles began. The Russian revolutionists, too, seem to be of the class which, as experience teaches us, seldom succeed, and work in ways which usually fail. The revolution seems to take the form of a struggle to outwit the police, and it must be owned that the revolutionists have played their game better than the police have played theirs. Assassins ride off in daylight, holes are bored, and treasure stolen, houses are set on fire, and the secret press spreads its publications through society. But when the revolutionists are caught they seem to be persons who, as individual operators, may be very dangerous to particular officials, but are outsiders in Russian society. They are old soldiers with one idea in their heads, that of doing mischief, or discontented nobles, or old plotters who have been wanted for years by the police, or young women. It is difficult to believe in the future of a revolution in which girls take a serious and prominent part. Not that the girls have it all to themselves. The boys seem as if they too would like to pronounce. A manifesto of Russian students has been brought to light, in which they threaten to shake society to its foundations because they are made to learn more clasics than they like. It is the sad waste of time thus involved that seems especially to harass their souls. They cannot bear throwing away their precious hours on what they term the sophisms of musty philosophers. Consequently, the whole Government of the Czar must be pulled down. This seems rather like asking that the Queen should abdicate in order that the modern side at Harrow may be properly encouraged. No doubt the education question is a difficult one for the Russian Government. Like some other of the difficulties of Russia, this difficulty has arisen from the premature introduction of Western ways. A zeal for the higher education seized on the Czar and his advisers some years ago, and it was only gradually discovered that no one knew what was to be taught, who was to teach it, or what those who received the education were to do or live on when their training was supposed to be finished. In the same way juries were introduced, and the judges were told that the essence of the institution was that they should be quite independent of the Government. The injunction was taken so literally that the trials became proceedings, not in which the police indicted the prisoners, but in which the prisoners indicted the police. Russia is a very young nation, and the young people of Russia seem to be of a fervid temperament; but despotisms do not crumble under the touch of hands so gentle and so impotent.

TURKEY.

Two articles on Turkey, published respectively in the *Fortnightly Review* and the *Contemporary Review*, contribute, though in unequal proportions, to a knowledge rather of the difficulties of the Eastern question than of the means by which they can be removed; yet it is remarkable that two writers who have few feelings or opinions in common should agree in recommending as the only hopeful measure the revival of Midhat Pasha's Constitution. The writer in the *Contemporary*, who describes himself as "An Eastern Statesman," is bitterly prejudiced, not perhaps against the Government of Constantinople which deserves his strictures, but against the general Mahometan population. He cannot even solicit relief for the unhappy fugitives from Bulgaria without striving to defeat his professed object by asserting, without a shadow of reason, that many of them were concerned in the massacres of 1876. He could not have received any proof of the guilt of these obscure exiles; and he might have remembered that they came from a different part of the country from that in which the outrages were committed. It is perhaps impossible to denounce in too strong language the corruption, the wickedness, and the folly of the Turkish Government, and especially of that part of it which is commonly designated as the "Palace"; but incessant vituperation is tiresome and unprofitable, and the "Eastern Statesman" always seems, perhaps unintentionally, to hold the English Government in some indefinable way responsible for the crimes of Turkish officials. There is no doubt that the Sultan and his Ministers have lately assumed a defiant or insolent attitude towards the English Ambassador. The honour conferred on the Minister of Police soon after Sir H. Layard had required his dismissal was a gross and deliberate affront; and the Ministerial newspapers of Constantinople have been instructed to use language which is not unlike the daily declamation of the journals of Moscow and St. Petersburg. Even within a few days the Sultan has conferred decorations on the Ulemas who sentenced a Mussulman to death for assisting a missionary in the translation of the English Prayer Book. For the present, the Sultan and his Ministers appear to prefer the patronage of Russia to the friendship of England. It is impossible for persons who are not acquainted with diplomatic details to judge whether the Foreign Secretary and his representative have uniformly adopted the most prudent and vigorous course. Political opponents who are incessantly on the watch to discover and expose their failures wilfully diminish for selfish objects the influence of their country.

The writer in the *Contemporary*, though he carps at the policy of the present Government, seems to dissent still more strongly from the doctrines of the Opposition. He truly says that it has been stated again and again since the Crimean war, by Liberal and Conservative Ministers, that British interests demand the independence and integrity of the Ottoman Empire. He adds that no serious effort has been made by English statesmen of either party to secure the execution of the Sultan's edicts in favour of the Christians. He more than hints at the expediency of annexing Asia Minor and Syria; and there can be no doubt that such a measure would be in the highest degree acceptable to the suffering population. It is nevertheless out of the question for the English nation to undertake a task which would not only be burdensome in itself, but dangerous, as it would excite the jealousy and probably the resistance of Russia and France. Even the alternative measure which the "Eastern Statesman" apparently recommends would be embarrassing both in relation to foreign Powers and as the certain occasion of violent attack on the part of the Opposition. It is suggested that Lord Beaconsfield should have sent an expedition to occupy Smyrna, and that he should have announced that it would be retained until a free Parliament had met at Constantinople. Of the feeling which would have been produced in foreign countries by such an enterprise some judgment may be formed by reference to the statement of the same writer that all the Consuls at Sofia, with the exception of the English Consul, encouraged the Prince of Bulgaria in his unconstitutional conduct to his first Assembly. The confidence reposed in England by the Turkish people, and the animosity against England sometimes displayed by the Turkish Government, are equally founded on the knowledge that English policy has been uniformly, though not always wisely, directed to the improvement of the condition of the people.

The anonymous author of the article in the *Fortnightly Review* describes himself as a British subject who has lived much abroad, and chiefly in the East. He professes to be absolutely without political bias, and he confirms his statement by impartial criticism of the errors which he attributes to both parties. He says that to Englishmen abroad "England has for some time past "presented very much the appearance of a ship suddenly "overtaken by a storm, in which one half of the crew "were doing all they could to frustrate the attempts of "the other half to navigate it, thereby bringing out into "painful relief the inexperience and want of nautical skill of "the latter." It is perhaps, on the whole, less discreditable to sail the ship unskilfully than deliberately to impede the prosecution of the voyage. Like the "Eastern Statesman,"

the writer believes that Turkish subjects of all denominations would gladly accept English government. He confidently asserts that, as a rule, there is no animosity between Moslems and Christians, though he is inclined to draw a strong moral distinction between them. "If once we "could get rid of the absurd fiction that in these coun-"tries the term Christian implies a follower of the teach-"ing of CHRIST, we should be better able to bestow our "sympathies in accordance with that teaching upon those "who are most deserving of them. There can be no doubt "that, in so far as the practice of the Christian virtue in his "daily life is concerned, the Moslem is in every way "infinitely superior to the Christian in Turkey." Of the Bulgarian agitation and its consequences the writer expresses a strong opinion. "Had wise counsels, instead of "an ignorant impulsive agitation, prevailed in England at "this time, more than a million of lives would have been "spared. The European provinces of Turkey would not "have become a theatre in which Bulgarian atrocities "were repeated again and again; and Christian nations "would not have been responsible for an amount of blood-"shed, spoliation, and consequent misery, unparalleled "in the annals of our time." "What," said NAPOLEON to METTERNICH, "are a million of lives to a man like "me?" To factious philanthropy also a million of lives form but a secondary consideration. The main contention of the writer in the *Fortnightly* is that the remaining framework of government and society should, as far as possible, be preserved. As the substitution of English for Turkish rule is practically impossible, anarchy will be only increased and accelerated by discrediting existing authority. The inveterate corruption of Constantinople can, in the opinion of the writer, only be counteracted by the establishment of a Parliamentary government. When the experiment was first tried by MIDHAT PASHA under unfavourable conditions, few foreigners thought that Turkey contained the elements of a representative system; but when the Parliament met, the members, to the surprise of critical observers, displayed an independent spirit which, if the institution had been maintained, would have thrown great difficulties in the way of central maladministration. Like members of the early English Parliaments, the representatives were seriously bent on the redress of grievances in the various districts from which they came; and if the war had not intervened, and if MIDHAT had remained in office, his Parliament would have given him invaluable support in his projects of reform. It is not surprising that the Russians after their victory insisted on the discontinuance of an experiment which might have regenerated the Ottoman Empire. It is unfortunately improbable that the SULTAN will at any time consent to renounce his despotic power; and the objections to coercion, though it would be for his own good, are not to be surmounted.

As far as English intervention for the protection of Eastern populations from domestic misgovernment and external cupidity is practicable, there is reason to believe that, notwithstanding the efforts of party orators, a generous and active policy is on the whole not unpopular. Mr. COWEN lately addressed at Newcastle an audience of the same character with the multitudes who applauded Mr. GLADSTONE's condemnation of foreign policy in general, and Sir W. HARCOURT's joyous exposition of the disasters which, according to his version of history, had befallen the Government. Mr. COWEN's constituents well knew that he was no supporter of the present Ministers, and probably they would have applauded a denunciation of a policy which, whether right or wrong in itself, was that of a Conservative Government; yet they listened to his bold and eloquent vindication of the national position of England with sympathy and unanimous approval. It would be difficult for Mr. GLADSTONE to reconcile Mr. COWEN's protest against the attacks on the Government with his own assertion that the present Parliament is more deficient in independence than any of its predecessors. In general Parliamentary independence might be defined as unwillingness to prefer party ties to public duty. As Mr. COWEN said, thirty or forty Liberal members have habitually agreed with him in the successive stages of the Eastern question. He added that several more would have been added to the number if the House of Commons had voted by ballot. It is satisfactory to know that some able members of the Liberal party are not inclined to acquiesce in the issue which has been raised by Mr. GLADSTONE and his docile followers.

THE LONDON SCHOOL BOARD'S BUDGET.

THE first Budget of the new London School Board has a natural interest for all who bore any part in the contest of last November. The issue most frequently raised at that election was the issue between possible economy and alleged extravagance, and the calculations of the Board for the year ending the 25th of March, 1881, are the first-fruits of the reflections brought home to the members by their recent canvass of their constituents. The sum of these calculations is that a rate of 6¼d. in the pound will be required to meet the needs of the Board, being an advance on the rate levied during the current year of about ¾d. in the pound. The two main items which call for this increase are of course the provision and maintenance of schools. For some time to come these items must go on increasing. There are still a number of schools to be built, and of the children who ought to be receiving instruction an appreciable percentage still manage to escape it. Even when the provision of schools shall have completely overtaken the present wants of London, and all the children for whom places are provided shall have been brought to occupy them, the steady increase of London will be represented in the budgets of the School Board. This, as we have often pointed out, constitutes the best answer to the charge of building more schools than are necessary. Let it be granted that a school here and there is not full and not immediately likely to be full, there is not the least danger that its benches will long remain empty. What is not wanted to-day will be wanted to-morrow. What is superfluous this year will be short of what will have to be provided three years hence. The net cost—the cost, that is, after allowing for the Parliamentary grant—per child during the current year has been 36s. 11d., but various reductions will bring it down next year to 34s. 4d. This saving has been effected partly by reducing the teaching staff, and partly, so far as can be made out from the abridged report of Mr. FREEMAN's speech, by reducing the provision of books and apparatus. The wisdom of both these economies is perhaps doubtful. Probably, however, as time goes on, the whole question of the provision of teachers will have to be reconsidered. During the most active part of the School Board's existence trade has been depressed, and the labour market has consequently been overstocked. If, as there seems reason to hope, that depression has passed away, the demand for labour of all kinds will greatly increase. Hitherto the main source from which the teaching staff of elementary schools has been recruited has been the pupil teachers; and it is yet to be seen whether pupil teachers will be forthcoming in sufficient numbers as other ways open in which parents may turn their children's labour to account. It is possible that the teachers in elementary schools may eventually be mainly taken from a class above the children ordinarily attending them. Why, for example, should not a boy who now leaves a middle-class school at fifteen go at once to a training college and be ready in two or three years' time to take the place of an assistant-teacher in an elementary school? He would, supposing secondary education to be properly organized, have the advantage by several years of an ordinary pupil-teacher, and might therefore begin real work at an earlier age. The middle classes are finding it more difficult to provide their sons with careers than the working classes, and, as things go, the post of an elementary teacher is not an ill-paid one.

It is, therefore, clear that no considerable further reduction in the School Board estimates can at present be looked for. Reduction in one direction will be more than balanced by growth in another. At the same time the desire for keeping down expenditure will remain, and the temptation to gratify it as far as possible will remain also. The danger will be that the methods taken to gratify it will involve a kind of saving with which we are but too familiar in the public service. The pennyworth of tar is an economy specially dear to official minds. It is the one point in which expenditure can be reduced, and this fact is quite sufficient to outweigh the other fact that if it is reduced at this point, the money which will still have to be spent will be in a great measure wasted. The main lines in which the outlay of the London School Board must proceed are marked out for it beyond the possibility of revision. But the efficient working of these main lines will often depend on their being properly fed by many side outlays. If these are withdrawn in order to save a far-

thing in the pound; the ratepayers will be the richer no doubt by that amount; but they will have the dissatisfaction of finding out eventually that they have sustained a far more than proportionate loss in the value they receive for all the rest of the money spent. The truth seems to be that there is only one way in which an appreciable reduction of expenditure can be effected without a more than corresponding reduction in school efficiency. When the Education Act was under discussion, a great deal was said for and against the principle of free education, and the feeling of the country proved decidedly adverse to any such arrangement. The importance of making parents pay for their children's schooling was maintained to be in all respects equal to that of making them pay for their children's food and lodging. As not unfrequently happens, as soon as the principle had been triumphantly vindicated in argument it was in a great measure abandoned in practice. A working man is supposed to pay for the education of his children, but the sum demanded from him bears no relation either to the cost of the article or to his ability to pay for it. As regards the cost of the article, he is only called upon to make good the deficiency left after reckoning the Government grant and the contributions of the ratepayer. In London alone, the latter amount for next year to about 650,000*l.*, and to that extent, together with the payments made by the Education Department, the education of the children of the poor is gratuitous. As regards the parent's ability to pay for his child's education, no attempt is made to measure it. At a given school each child pays the same fee, which is usually calculated on the supposed incomes of the poorest class among the parents.

We are not blind to the very great difficulties which compulsory education imposes in the way of a more satisfactory arrangement. All we say is that a vast number of the parents whose children are now receiving a partially gratuitous education in School Board schools are perfectly well able to pay a much larger fee than they do. The only person who would suffer if a larger fee were exacted from them would be the publican. They would have so much less in the week to spend on drink, and in so far as they were subjected to this privation, both they and their families would be all the better for it. No doubt the unfortunate tendency which there is to take the side of the parent who is summoned for not sending his child to school, and the equally unfortunate tendency which sometimes seems to lead a School Board officer to bully the wrong man, would interpose very serious obstacles to the exaction of really adequate fees. But when the Education Act supplies a power of paying or remitting school fees in cases of indigence, we fail to see why the average fee charged should not be larger than at present. No doubt the applications to be excused from paying it would be more frequent; but if a rigid rule were laid down that, where the father was in receipt of decent wages, the payment should never be remitted, we suspect that the increase of expense under this head would be very much less than people suppose. At all events, it would be more satisfactory to know that those who could afford to pay a higher fee were paying it, while those who had a fair excuse to urge were excused from paying, than to know, as we do now, that a large proportion of the parents of children in School Board schools are paying not only less than they could well afford, but less than, down to the building of a School Board school in their neighbourhood, they were paying in a voluntary school. For free education resting on a really consistent and universal basis there may be something to be said. For an education for which the parent is supposed to pay, and, to a considerably greater extent than he does at present, could pay, while it is mainly provided by the taxpayers and the ratepayers, there is extremely little to be said. If any considerable saving is effected in the education rate in London, it must be by a somewhat nearer approach to the principle that a parent is bound, when he has the means, to supply his child with necessaries and to be prepared to pay for them.

M. FERRY'S BILL AND THE SENATE.

NEITHER of the two parties into which the French Legislature is divided upon the question of education seem anxious to bring matters to a decisive issue. By general consent the battle is to be joined upon the 7th Clause of the Bill relating to superior education. In the Chamber of Deputies this measure was passed so long ago that it is already almost forgotten. Principles, important as they are, must yield in interest to persons, and when every morning brings its new crop of dismissals and appointments in the public service, a deputy cannot be expected to trouble himself much about a Bill which, as far as he is concerned, is already an old story. The Government, however, might have been expected to show rather more zeal for their own legislation. Delightful as it may be to feel that the 7th Clause has been safely navigated through the Lower House, this pleasing reflection must be a little dashed by the consciousness that its trials are only half over. It has to pass the Senate as well as the Chamber of Deputies; and, by the practice of most Legislatures, it should have been taken up to the Senate as soon as the Chamber of Deputies had disposed of it. Instead of this, the Senate have not even yet been seised of it. They have debated an Education Bill indeed, but it is one that excites infinitely less popular interest than that with which M. FERRY's name is especially associated. So far as the relative importance of the two measures is concerned, it is by no means clear that the composition of the Educational Council ought not to take precedence of the exclusion of the non-recognized religious orders from schools. But Bills stand to one another in the ratio of the importance attributed to them quite as much as in that of the importance they actually possess. It is far from improbable that, if the 7th Clause is passed by the Senate, the ecclesiastical authorities will so modify their teaching arrangements that schools will continue to be taught by members of religious orders, with the single difference that the recognized orders will concern themselves with teaching, and leave the non-recognized orders to carry on charitable works. In that case the clause will really become—what it has often been represented as being—an anti-Jesuit clause pure and simple. Teaching will be given as now by religious orders, only it will not as now be given by the religious order best qualified to give it. For the moment, however, it matters little whether the 7th Clause is likely to answer its purpose or to fall short of it. It has become by this time a test question, around which parties are forming now combinations that may hereafter have results extending beyond the particular controversy which has given rise to them. Frenchmen are beginning to see that the convenient word Republican has concealed differences of opinion as deep and as irreconcilable as any aroused by the dispute as to the form of government. Men who take opposite sides upon the question whether the State or the parent is to choose the kind of instruction a child shall receive, or upon the question whether the Catholic Church shall be recognized as a French institution, or treated as an enemy to be banished as soon as may be and kept under strict surveillance until it can be got rid of, may in the end discover that the sympathies which bind them together on matters of this order supply a more real ground of union than more directly political issues.

One cause possibly of the delay in bringing the Education Bill before the Senate is the desire of the Government to strengthen their ranks in the interval. Life Senators drop off from time to time, and as the Government command a majority, though a small one, in the Senate, each new vacancy gives them a fresh recruit. On the last occasion this process seemed in danger of being interrupted. A Life Senator had to be elected in place of M. DE MONTALIVET, but the Left no longer presented a united front. According to the arrangement existing between the several groups of the party, it fell to the turn of the Extreme Left to choose the candidate of the majority. Their choice was in itself an excellent one. Dr. BROCA is well known as a man of science, and on the theory—perhaps as good a one as can be devised when tradition supplies no rule—that the Second Chamber is to be composed of eminent men of all kinds, he had a very good claim to the support of the united Left. But passions are rising too high to allow of any arrangement made before they were aroused being rigidly adhered to. Dr. BROCA may have every virtue under heaven, but he is a supporter of the 7th Clause, and to an influential section of the Left Centre this is a sufficient condemnation of his pretensions to enter a political Assembly. About twenty Senators, headed by M. DUFAURE and M. JULES SIMON,

brought forward a candidate of their own, to whom the Right consented to give their votes. At the first ballot Dr. BROCA failed to secure the necessary majority, and on Thursday a second vote was taken. The Government succeeded in carrying their candidate, but not without taking extraordinary pains. It will be difficult for them to hold their own in the Senate, if upon every critical division they have to recall their Ambassadors from Vienna, Berlin, and Switzerland. By doing this they managed to carry Dr. BROCA by three votes. In itself this might seem conclusive as to the fate of the 7th Clause. The same urgent whip, it might be said, will again be issued, and though the division may be close, it will be decisive. It seems doubtful, however, whether every Senator who voted for Dr. BROCA can be trusted to vote for the 7th Clause. The circumstances of the election were such as may well have indisposed moderate members of the Left Centre to break up an understanding to which the extreme Left had honourably adhered in previous contests. It would certainly have been better if full notice had been given of the intention of a part of the Left Centre not to vote with their party in future elections, and if the time chosen for this notice to take effect had coincided with a complete revolution of the rota. As it is, the members of the Extreme Left have some reason to complain that the Left Centre has accepted their support and not given its own in return.

The importance of this division in the Left Centre is not limited to the particular question of Dr. BROCA's election. It indicates a growing inability on the part of a particular group of moderate Republicans to work any longer with the Republican party. The wonder is, not that this inability should now be beginning to show itself; it rather is that it should not have shown itself long ago. The Left Centre and the Left seem every day to have less in common with one another. The one point upon which they cordially agreed was the establishment of Republican institutions, and now that Republican institutions are established and the agreement as to their merits no longer counts for anything, the Left Centre cannot help seeing that the Government which they are expected to support is one with which they have absolutely no sympathy. The Republic as it is understood by men like M. JULES FERRY is not the Republic as understood by M. DUFAURE. It is in no sense a Liberal Republic. It aims not at securing freedom for all parties, but at denying freedom to all parties but one. Instead of throwing the doors of the Republic wide open, its apparent object is to shut them close. The more Frenchmen can be left outside the better those inside are pleased. A Republic in which they had to live on equal terms with their fellow-countrymen of opposite parties would, for them, be little better than a monarchy. They like not to defeat their adversaries merely, but to crush them—not to prevent them from overthrowing the Republic, but to taste something of the bitterness of life under a Republic. This temper of mind is altogether opposed to the anticipations entertained and held out by the Left Centre at the time when it exercised a controlling voice in the Republican councils. The great mistake committed by the moderate Republicans has been in acquiescing without remonstrance in the change which has been going on. That error has been due to the mistaken views of conciliation which led M. WADDINGTON and M. LÉON SAY to think that wrong measures became right if they were carried by the right men. If a year ago these two politicians had retired from the Ministry rather than accept M. FERRY's Education Bill, the Left Centre would by this time have exercised a controlling voice in the Senate, instead of, as now, being divided at the very moment when it is important that it should be united. But, though wiser counsels have been listened to late and partially, it is something that they should have gained a hearing. Though it is only the first step towards the creation of a Republican Opposition, it is better than no step at all.

RAKING UP GRIEVANCES.

THE fact that the Rev. MALCOLM MACCOLL should, in the *Contemporary Review* of this month, have written an article on "Forgotten Aspects of the Irish Question," may not seem in itself a very important one. Mr. MACCOLL is a man of an active pen, as well as of other active qualities, and his articles are proportionately many. But at a time when political excitement is increasing, and when it is to a very considerable extent already directed towards Irish matters, it may seem a little surprising that any one should endeavour to recall "forgotten" aspects of the interminable "question." True, there are some such aspects which might not without advantage be recalled, such as the perpetual disunion of the Irish among themselves, the political incapacity which they have more than once evinced, and so forth. But these are by no means the aspects to which Mr. MACCOLL invites his readers' attention. These are simply the old accusations of English tyranny, the forgetting of which is certainly not due to any want of reminder in the most picturesque terms on the part of Irish politicians. At a moment when the actual distress in Ireland, the lawless agitation which Mr. PARNELL began last summer beyond the Channel and is now continuing beyond the Atlantic, and the relations of the English Home Rulers with some members of the Liberal party, are making the question of Ireland a hot and almost a burning one, Mr. MACCOLL thinks it well to recapitulate the old tyrannical legislation of the fifteenth century, the cruelties of the Elizabethan commanders, the enormities of the Penal Code, the restrictions once imposed on Irish commerce, and so forth. This is his Eirenicon; his contribution to the settlement of a vexed and difficult problem. The party which calls itself Irish is not sufficiently alive to the injuries which it has to revenge, so Mr. MACCOLL is good enough to put in a reminder. The debate is already so unimpassioned and conducted with such an absence of feeling, that Mr. MACCOLL feels constrained to add a little fire and life to it.

We shall not attribute to the author of this mischievous article the important position of an *Éminence grise*; but he may possibly be allowed by those who are conversant with the politics of the last few years to possess some of the functions and peculiarities of a stormy petrel. A certain very famous passage of Greek oratory characterises, not, if we remember aright, very complimentarily, the persons who make themselves busy and obvious in times of public danger and difficulty. Something of the same kind may have been noticed perhaps in modern times, and philosophic observers may have admired the adjustment of means to ends which manifests itself whenever a Church is to be disestablished, a difficult question between the outlines of bean-stacks and human bodies to be settled, a new alliance between Home Rulers and Liberals to be negotiated. Certainly it is singular to find, in an article where it has no conceivable fitness, a long citation from a speech of a Conservative member denouncing Mr. GLADSTONE. But Mr. MACCOLL's argument is, to do him justice, quite consistent from the first, though it may be occasionally diversified by such digressions as this. It is not a new one; it is not, even in strict literalness, a true one; and it may be left to all impartial judges to decide whether it is fair. It simply comes to this:—In time past England has done great wrongs to Ireland; therefore in time present England ought to concede everything to Irish demands. To the feeble folk who point to the enormous reforms, concessions, or whatever they are to be called, of the last fifty years, Mr. MACCOLL has his answer at once. These are only instalments, and quite insufficient instalments. Indeed, by an ingenious misuse of language, he contrives to minimize even such an admission as this. The Land Act, he said, was passed to secure to the occupier "the legitimate fruit of his capital and toil." Clearly, if this fruit was already legitimate, no thanks are due to those who made it legal. At any rate, says our author, the Irish are still unhappy. Perhaps it may be said that this is because they are unreasonable; but Mr. MACCOLL assures us, on the respectable authority of Sir JOHN DAVYS, that it is far from being the case. "There is no people," says this authority, "that doth "love equal and indifferent justice better than the Irish, although it be against themselves." We fancy that in the course of two or three centuries the last clause has somewhat lost its validity, but this is a trifle. Mr. MACCOLL soon gets into his main line of attack, and this is, as we have said, simply a reiteration of the worst charges against England that he can pick out of Irish history from the time of the invasion to the end of the eighteenth century. Not merely direct cruelty, but all the incidents of military operations, such as famine, are made articles of impeachment. It is needless to say that the very ample vengeance which the native

Irish took more than once, is barely alluded to, and then (with the help of BURKE) dismissed as "provoked." It is also needless to say that no hint is given of the fact that, at any rate since the seventeenth century, the worst barbarities and the worst enactments were due, not in any sense to England, but simply to the fratricidal rage of Irishmen against Irishmen. Mr. MACCOLL's readers will look equally in vain for any acknowledgment of the fact that, bad as the repressive policy of England towards Irish trade undoubtedly was for a long time, it was simply the general commercial policy of the period, which almost any other country would have pursued towards a dependency, even if that dependency had not been a constant trouble and drain. Such reflections as this are not in this writer's way. He is concerned merely to pick out the plums of past tyranny and exhibit them. He does indeed remark on the encouraging fact that "Irish disaffection has retired step by step before "English justice." It might possibly strike some people that Irish disaffection, if not at the present very obvious in its usual form, is somewhat busily engaged in the tempting occupation of expropriating, or endeavouring to expropriate, its landlords. You cannot expect people to do several things at the same time. Yet an anthology might be made from the speeches of Irish orators during the last twelvemonth which would not, we think, in any country but England be accepted as evidence of the "retirement of disaffection."

It is by no means our intention to bandy words with Mr. MACCOLL as to the particular historical facts which he mentions in his article. We are inclined, indeed, to think that, though no just and instructed Englishman can exactly be proud of the relations of this country with its sister island, we have of late years been rather too prone to accept sackcloth and ashes for the crimes of our forefathers in this respect. But even supposing that the extreme theory of our ancestors' guilt be true, we do not see that the consequence which is sometimes drawn from it follows. For an entire generation, we might almost say for two entire generations, no one who pretends to historical accuracy or fairness will say that Ireland has been under any artificial or external disadvantage as regards Great Britain. If she has no manufactures, it is now entirely her own fault. If her people are in many cases poor and miserable, so are improvident agricultural peoples all over the world. Only rigid thrift and self-denial, like that of the French, can secure small owners or small occupiers against occasional distress, unless (as in the often and most ignorantly quoted case of the Channel Islands) their profits are largely supplemented from other sources. If the capital which might make Ireland fertile, or, by means of manufactures, supply her want of fertility in parts, is driven away, whose fault is that? The fault of the wickedness of Queen ELIZABETH's generals, or the fault of the incurable delusions of the Irish peasantry as to the rights of property? All these things being so, the raking up of the evil deeds of the sixteenth, seventeenth, and eighteenth centuries is as illogical as it is inflammatory and mischievous. Perhaps, indeed, those who resort to it are as careless of logic as they are of the laws of respectable political controversy. The reckless assertions of Mr. PARNELL in his American tour are not much more than on a par with these revivals of old stories, and what they lose in accuracy of fact they gain in logic. For if women and children had actually been shot down by the Mayo process-servers at this time of day, there would certainly be a *primâ facie* case against England. Supposing that massacres and outrages were committed two centuries ago, the connexion between this fact and the inferences drawn from it would still be impalpable and invisible. In both cases, however, the object is the same, and an old one. Atrocities at any price; historical and actual atrocities, if possible; but in any case, atrocities. Stories of cannibalism and suicide, and of terrible penalties imposed or proposed upon Roman Catholic priests, may be absolutely *nihil ad rem*, but they will serve to influence a people inflammable and ignorant beyond most people, and perhaps to excite some sentimental and illogical Englishmen as well. There is another obvious consequence. They will not only do this, but they may too easily lead to reprisals. The story of 1641, of the siege of Derry and the methods employed to reduce it, of the wild deeds of that truly "Mad" Parliament, the last Irish Parliament of JAMES II., is as open to intemperate Irish Tories as Mr. MACCOLL's arsenal of antiquated horrors is open to him. Now that the Liverpool contest has made Irish politics more prominent than ever in English elections, this fact opens out a very pretty prospect. Give the electioneering historian a good library, or even half-a-dozen well-known books, abstract from him any lingering sense of logic and decency, and it will be hard if some spirited appeals cannot be concocted. The appropriateness of the temper which such argumentations is likely to induce for the discussion of social, political, and economic problems of the utmost difficulty and perplexity need hardly be further insisted on. We have had, indeed, but too vivid experience of its working in the last few years. Transfer the tactics from Bulgaria to Ireland; confuse the circumstances of half-a-dozen different centuries, and point the moral that "ask and have" is the only proper course for a people so burdened with sins as the English to pursue towards a people so laden with wrongs as the Irish. Such it would appear is the *mot d'ordre* implied in Mr. MACCOLL's article: it remains to be seen how and by whom it will be obeyed or openly pronounced.

A CRUEL SPORT.

THE managers of the Royal Aquarium and the public for whose peculiar tastes they cater bear a curious resemblance to the "corner men" of whom we had occasion to speak last week. The characteristic feature of these latter gentry is the skill with which they inflict every conceivable injury, and yet stop short of taking life. They reduce their victims to insensibility, they break their limbs, they knock out their teeth, they go as near murdering them as a prudent regard for their own safety will allow. But they hardly ever pass this limit. Long practice has taught them where to pause; and though they will go on to the very edge of the forbidden ground, they almost always manage to stop short of it. This is precisely what happens at the Aquarium and other such places. The chief advertised amusement is usually an exhibition which has no merit whatever beyond the fact that it is attended with appreciable and visible danger to the performer, and yet that the performer usually comes out of it alive. Whether we ought to add, and that the performer is a woman, is not clear. Undoubtedly the ZAZELS and the ZAOS who have of late become a constant element in a music-hall entertainment are women; but this may be attributable to other causes than the public indifference to male danger. The chance of seeing a man fall violently on the ground and taken up all but dead might perhaps draw as large a crowd as the same cheering probability in the case of a woman. The reason why managers prefer to put women's lives in peril may either be that they think there are too many women in the world, or that they can be had more cheaply, or that they are less troublesome to train, or that they are willing to come, while men are not. The only thing that is certain is that, for some reason or other, women far oftener than men are to be seen risking their lives to give pleasure to a crowd which is too brutalized to care for any less stimulating amusement.

Some three months ago we had occasion to notice an exhibition of this kind at the Alexandra Palace. One ZAO, "the flying trapeziste," was advertised to execute a feat called the "Balista flight," the point of which consisted in the performer's being shot from a box by a powerful spring, under the impulse of which she was to make several evolutions and then descend into a net. In one of the rehearsals ZAO struck her head against a projecting iron, and fell into the net senseless and streaming with blood. In speaking of this accident we said that, after what had happened, there need be no fear of the "Balista flight" being actually performed. In this respect we underrated the zeal of the British manager. Possibly at the Alexandra Palace it was not performed. But, if so, others were ready to rush in where the directors of the Alexandra Palace feared to tread. The "Balista flight," or something closely resembling it, has been performed at the Aquarium, and on Saturday the waiting public were gratified by the accident which they had presumably hoped to see. The cause of the accident this time was not a projecting iron, but the over-strength of the spring by which the performer is shot out of the box. ZAO was sent forward with so much force that she broke through the net placed to receive her, and struck the ground beneath with a crash which, according to one account, "was heard all

man. In 1839 he gave practical testimony to his new views, when he left Oxford to take the incumbency of the Proprietary Chapel in Margaret Street, of which Henry Drummond was lessee, and which had been previously held by the late Mr. Dodsworth—who himself joined the Church of Rome some years after Mr. Oakeley—and had before belonged to the Unitarians. It is here that his theological career may be said to have begun.

Mr. Gladstone spoke of Mr. Oakeley six years ago, in an article in the *Contemporary Review*, as one "who united to a fine musical ear a much finer and much rarer gift in discerning and expressing the harmony between the inward purposes of Christian work and its outward investiture, and who had gathered round him [at Margaret Chapel] a congregation the most devout and hearty that I, for one, have ever seen in any community of the Christian world." In that congregation Mr. Gladstone himself and the late Mr. Hope Scott were constant worshippers, while many others who had little sympathy with Tractarian views, such as the late Bishop Thirlwall, were attracted by Mr. Oakeley's thoughtful and weighty sermons, which dealt mainly with the ethical aspects of religious truth. But the speciality of Margaret Chapel in those days was to be the pioneer of what was afterwards called "Ritualism" in the Established Church, though scarcely any of the distinctive details now associated with the term would have been found there. Mr. Oakeley's fondness for ritual, which he carried with him into his new communion, probably received its first impulse from his boyish delight in the services of Lichfield Cathedral, where, as we have already seen, he used to play the organ on week days. But choral services and Mr. Oakeley's single surpliced chorister were then considered a startling innovation anywhere out of a cathedral, and the "eastward position" must have looked still more unusual; of vestments, or even of lighted candles—except, as Mr. Oakeley afterwards explained, "on foggy mornings"—there was no thought; while the plain wooden altar cross was quite alarming. It is curious to find a letter in Bishop (then Archdeacon) Wilberforce's Life expressing his disgust after going to Margaret Street at the oddness and Romanizing character of what would now be thought very moderate ceremonial, hardly above the average of many "Evangelical" churches, and his consequent determination never to go there again. It would however be hardly too much to say that to Mr. Oakeley's ministry at Margaret Chapel, as much as to any other single instrumentality, is due that marked restoration of musical and ritual solemnity which has triumphed over the parson-and-clerk duet which formed the almost solitary ideal of Anglican worship in the days of our grandfathers, though it has now almost faded into a dim tradition of the past. It may be difficult for those of a later generation to understand how in 1844 (which falls within the period of Mr. Oakeley's incumbency) the *Times* was fiercely asserting "the repugnance of the laity to the introduction of these obnoxious novelties," which involved "a contest not about words but about principles," and their indignant demand "to be allowed to worship as their fathers worshipped, and to observe the same ritual they had been accustomed to from infancy"; and how mobs of thousands of persons would wait for hours in pouring rain to hoot and yell at the clergyman who introduced these "obnoxious novelties," the whole dispute being about the wearing of a surplice in the pulpit. It is still harder perhaps for us to realize how a year later a huge vestry meeting was gathered in London to complain that "a parish containing upwards of 43,000 souls (of whom it may be doubted if 43 had been in the habit of attending the parish church) was disturbed to its centre at the will of one individual, who at his mere pleasure disturbed and deranged *the beautiful and solemn ceremonial of Church service* which had been handed down to us unchanged for more than two centuries," *i.e.* the parson-and-clerk duet. At last the matter found its way to the House of Lords, and the Bishop of Exeter (Phillpotts)—who had been sharply admonished by the *Times* "as a conscientious man to retire from the bench, and let the people of England have the sacred service of the Church as their sires and grandsires had it"—ventured to ask Earl Fortescue "what these obsolete forms and usages were" which he had denounced, and which, as was asserted, "forced the son to pass the grave of his father, the widower of his wife, the mother of her child, to seek in some remote and unaccustomed house of worship that spiritual sustenance which the novel practices at their own church had rendered unacceptable?" Lord Fortescue, being thus brought to book, had to reply that "the innovations complained of, and which had caused all the mischief, were three in number—namely, preaching in the surplice, the sentences in the Offertory, and the collection after service." We are almost afraid our extracts may raise a smile of incredulity; but it is necessary to bear these things in mind in estimating the nature and extent of the ritual reform, as most people would now agree to call it, to which Mr. Oakeley gave the first impetus in his services at the obscure little chapel which has since grown into one of the stateliest churches of London.

It was while Mr. Oakeley was still at Margaret Street that the disturbance arose at Oxford about his friend and brother fellow Mr. Ward's *Ideal of a Christian Church*, for which he was deprived of his M.A. degree by a decree of Convocation of very questionable legality. Mr. Oakeley, who had nothing to do with the book, chivalrously placed himself by his friend's side, declaring that he also "claimed the right to hold, though not to teach, all Roman doctrine"; and this avowal led to one of the earliest of those ecclesiastical *causes célèbres* in the Arches Court which have of late become only too frequent. But the defendant did not care to await its termination. Within a few months his great leader Mr. Newman had decided on leaving the Church of England, and Mr. Oakeley almost immediately followed him. After going through a theological course at St. Edmund's College, Ware, he was re-ordained by Cardinal Wiseman, and in 1850 appointed to the charge of St. John's, Duncan Terrace, to which was added two years afterwards the titular dignity of Canon of Westminster, and he retained both offices till his death. At Islington, as before at Margaret Street, Mr. Oakeley paid great attention to musical and ceremonial arrangements, and he may be said to have effected no inconsiderable reform in these respects in his new as well as in his old communion. Discarding the services of the "shrieking sisterhood" of female professionals, then almost universally in vogue in Anglo-Roman places of worship—though expressly forbidden by the Roman ritual—he entrusted the singing to a well-trained choir of men and boys, and had soon established for his church the reputation of one of the best musical services in London. But it would be a great mistake to imagine that either there or at Margaret Street his attention was absorbed by externals, however important. Both in his Anglican and his later ministry he always showed himself an indefatigable parish priest, and his church was thronged by a multitude of devout worshippers. It may perhaps be regretted that the career of active usefulness which he had deliberately marked out for himself since he gave up residence at Oxford left him so little time for literary work. Some volumes of sermons and devotional treatises, and several pamphlets and review articles, he has left behind him, which go far to show that under different circumstances he might have made a name in literature. The first and one of the most popular of the Littlemore Series of *Lives of the English Saints*, edited by Mr. Newman, was from his pen, the Life of St. Augustine of Canterbury. His style was evidently, though perhaps unconsciously, modelled on Cardinal Newman's, and has much of the grace, though it lacks the concentrated force, of that great master of English prose. It should be added that his controversial writings, if such they can be called, are free, as he was himself, from any taint of bitterness. Nothing would be more out of harmony with his whole tone than *e.g.* to designate the Church of which he was once a minister, as another clerical convert has lately done, "a monarch's cast-off mistress, now in her dishonourable age vainly striving to cover her nakedness with the gifts which purchased her seduction"—rather an unintelligible phrase, as the Church was not enriched but greatly impoverished at the Reformation—or to describe English Protestantism generally as an "offensive centipede." He kept up through life, as was observed before, habits of friendly intercourse with his old associates, and six years ago he might have been seen at the Union Jubilee dinner at Oxford sitting by the side of Mr. Matthew Arnold, who was an undergraduate at Balliol when he was a Fellow there. One can hardly help wondering, as the converts of that generation are passing away one by one—there are few of the more eminent left now besides the greatest of all—how far their departure may affect that better understanding between members of the rival communions on which Cardinal Newman was discoursing the other day. There can be no doubt that the influence of their antecedents and personal character has done much indirectly in many ways to bridge over what once seemed an impassable chasm, the more so as many of them, like Mr. Oakeley himself, had shared to the full in their earlier days that hatred of the Pope and all his works which Dr. Hook's biographer tells us he used once to consider the essential duty and characteristic of an Englishman. It would be another point well worth inquiring into, but far too wide a question to discuss at the fag-end of an article, what kind and amount of permanent impression the Tractarian converts have made on their adopted communion. There is certainly a conspicuous difference, which can hardly fail to strike outsiders, between the general tone not only of Roman Catholic society in England but of Roman Catholic worship and preaching, as it is now and as it was thirty years ago.

THE MYSTERY OF DOMESTIC SERVICE.

THE distinguished author of the *Servant's Practical Guide* is already known to the public by a learned and discriminating treatise on the manners and tone of good society. Although a member of the aristocracy, he had shown himself to be entirely free from the spirit of exclusiveness which is sometimes assumed to be characteristic of his class. He can contemplate without misgiving the possible diffusion among the masses of those exquisite social graces which have hitherto been the sacred possession of the few, and, as if to vindicate yet more emphatically the breadth and liberality of his sympathies, he now undertakes to discourse upon the manners and customs of domestic servants. Like Orpheus, he has been led by strong devotion to pursue his ideal even to the lower regions, and, having wandered through all the labyrinths of the kitchen and the servants' hall, he at last returns to the light of day to expound to an ignorant public the mysteries of the under world. We were at first disposed greatly to marvel at the Shakspearian grasp of character which could enable one and the same person to pronounce with equal science and familiarity upon the proper bearing of a bishop and the fit behaviour of a butler. It seemed almost too much to expect of "a member of the aristocracy" that he should be able to distinguish between the duties of the first and second housemaid, and allot to the second footman his exact share in the

labours of the household. But this sentiment of astonishment was considerably diminished when we came to consider calmly the general fabric of modern society. Here, as in all other human affairs, the law will be found to hold good that extremes finally meet; and thus we are forced to acknowledge that the noblest product of our later civilization, next to a genuine "member of the aristocracy," is a servant who has grown up under the influence of aristocratic tradition. Following this train of thought, we are brought at last to perceive that the subjects of these two treatises are intimately connected; and that, if the author had so chosen, they might even have been combined. For in what way could the beauty of aristocratic manner and deportment be so aptly illustrated as in the person of a well-educated butler? A member of the aristocracy desiring to elevate his species might seek in vain among his own personal friends for a single example of faultless bearing; and yet among the servants of his friends he could scarcely go astray. Indeed the butler and the footman together may be taken at their best as a complete epitome of the mingled condescension and stateliness of English society. In the plushed and powdered beauty of the one is enshrined a perfect image of the outward magnificence befitting a powerful people, while the grave simplicity of the other would seem to be rather designed to reflect the spiritual qualities of his master's greatness. To pass at once and without some intervening agent from the footman to the host would be too severe a trial of faith even to the most devout. No man, however elevated his position, could hope to bear the test of direct competition with the stately creatures who stand at his doors; and by the cunning economy of our domestic life it has therefore been wisely ordained that the butler should be employed to break the suddenness of the fall and reconcile the mind by a gradual decline of splendour. Although he is dressed with all the simplicity of his master, he is nevertheless endowed with a lofty dignity of bearing which his master cannot rival, and yet at the same time he extends to all visitors to the house a measure of tolerant indulgence which, immediately following the unconcealed contempt of the footman, partly prepares them for the warmer greetings of their host. It has always been a matter of surprise to us that creation, so sparing in the production of other forms of greatness, should have multiplied the race of butlers with such a lavish hand. Nor is it less surprising that their noble qualities and the intricate mysteries of their craft should never until now have attracted reverent studentship. From time to time they have been forced to endure, in common with other rulers of the earth, the feeble satire of professed caricaturists; but it has been left to "a member of the aristocracy" to make that subtle and sympathetic analysis of their virtues which we should expect from one who desires to spread a knowledge of the tone and manners of good society. For it must be remembered that real stateliness of manner is fast falling into decay. It can no longer be learned from our equals, or even from our superiors, and the time must soon arrive when it will be found to have survived only in our servants. It is impossible in these democratic days to predict a very long life even for the dignity of a butler; and it therefore behoves us not to neglect the opportunities of study that are still offered to us.

It should be stated, however, in justice to the liberal scheme of his work that the "member of the aristocracy" does not limit his attention merely to butlers. He even condescends to describe in detail the duties of a nurserymaid, and the shining buttons of the page-boy are found to come within the limits of his inquiry. In short, there is no form of domestic service, however humble, that he will not undertake to discuss if only his readers will agree to be serious. He rightly repudiates at the outset any attempt to approach such a subject in a light or irreverent humour. And even the most frivolous mind must admit that this is indeed no joking matter. We may indulge a laugh now and then at our Parliamentary system, but the more complex machinery of domestic government compels a serious demeanour. It is therefore not wonderful that the writer should have seen fit to adopt "a didactic and unrelieved mode of handling the subject." A man who undertakes to discuss the "method of waiting-at-table, and every branch of domestic service in force in the upper circles of society" cannot by any assumption of gaiety escape a sense of deep responsibility. To write of the "tone and manners" of the great must by comparison have seemed an easy task, for if he had failed in his endeavour, he would only have subjected himself to the criticism of his equals, or his superiors. But even a member of the aristocracy must needs tremble when he has to meet a butler on his own ground. However much he may have fortified himself by consultation with "experienced and competent servants," he must still feel that he is embarking upon a perilous enterprise. Servants, by long-established tradition, are allowed freely to canvass the qualities of their employers, but the corresponding right of a master to criticize his servants has never been conceded, and we cannot but fear lest this endeavour to lay down with exactness the duties which each servant is to discharge should lead to a serious curtailment of that indulgent consideration which servants have hitherto extended to other and less fortunate classes of society. We must admit, however, that even the most sensitive and high-spirited inhabitant of the servants' hall can scarcely take offence at the tone which our author has adopted. Taking the work as a whole, it may be said that the "member of the aristocracy" has been uniformly considerate and respectful. No one could feel more deeply the dignity of the calling which he undertakes to discuss; and there is abundant evidence throughout the volume that his mind is peculiarly susceptible to the grand and imposing effects which a fine array of servants is calculated to present. Here, for example, is a vivid little picture of the majestic spectacle offered to the afternoon caller:—"The bell being rung, the footman opens the hall door wide; he does not hold the handle of the door itself in his hands, but opens it to its full extent, and stands in the centre of the doorway." These few words serve to conjure up a scene of dazzling beauty, while at the same time they serve to provide exact information to a footman ignorant or forgetful of the dignity of his profession. Within our limits it would be obviously impossible to take account of the many little touches of a like character which adorn these pages, and give reality and delicate finish to this interesting gallery of servants' portraits. The "member of the aristocracy" may be said to possess something of the patience and minuteness of Defoe. With the keenest watchfulness he notes every slightest movement of butler, footman, or page-boy; he tracks the progress of the domestic servant through every occupation of the day, and follows him in the exercise of his art with such a loving and searching glance that we are forced to believe that although a hero may miss the applause of his valet, yet the valet is in no danger of having his greatness undervalued by his master. It is of course to be understood that these portraits are in some sense ideal, and they are intended in the first place for the instruction of masters and mistresses. When, for instance, we are reminded that "heavy dining-room chairs are sometimes difficult for a lady to move as near to the table as requisite, therefore a little assistance from the footman is required, which he renders by holding the back of the chair, and gently pushing it forward," we know that this is intended as a delicate mode of conveying to the mistress, or to the servant through the mistress, a noble conception of duty. And yet it is impossible not to feel that such touches are derived from the actual observation of nature. The picture of some perfect footman "holding the back of the chair, and gently pushing it forward," has been indelibly stamped upon the writer's memory, and the young housekeeper is not therefore to be disappointed if her own servants do not always exhibit the excellences described in these pages. The member of the aristocracy has perfected his ideal from the observation of many footmen, and it is easy to perceive that, in spite of his respect and veneration for servants as a class, he still retains the recollection of certain isolated examples of human frailty. He has reminiscences of dinners in which the cucumber was not handed with the salmon, and when the jelly did not accompany the mutton; but these sadder experiences have not been allowed to embitter his general survey of the servant's life. After all, even butlers and footmen are only human, and it is by such little faults as these that they show their sympathy and kinship with a fallen humanity.

ST. JOHN OF RYLO.

I.

BULGARIA, if we take the word not in the special and limited sense actually assigned to it, but in a sense corresponding to its historical and ethnological extent—that is, as denoting the portion of the Balkan peninsula chiefly inhabited by Bulgarians, and which may be defined as reaching from Servia to Adrianople, and from the Danube to the neighbourhood of Salonica—includes within itself three centres of almost equal importance, three hearts corresponding to as many different yet correlated modes of vitality. The political life, once radiating from Preslava, then from Ochrida, and, later, from Tirnova, now centres at Sofia; the popular or national life has even now in a peculiar and distinctive fashion its main seat at Tirnova; but the heart of the religious or ecclesiastical life, intimately connected, though not absolutely identified, with the two former, pulsates at the Monastery of St. John of Rylo.

Rightly to understand this, we must call to mind that while among most other East-Christian nationalities—Armenian, Syrian, Greek, and so forth—the episcopal hierarchy long formed, and in a measure yet forms, the mainstay of the national existence, of which it is itself the most prominent, though not always the truest representative, this very position and these duties have for centuries past been occupied in the Bulgarian nationality by the monastic brotherhood. Compelled by the policy of their Ottoman conquerors to admit a Greek, that is an alien, Episcopacy over them—an organization in which they recognized little else than an instrument of Mahometan oppression and which they hated accordingly—the Bulgarians transferred their religious loyalty to their own native monastic institutions, whence the intrusive Fanariote element was jealously and, in general, successfully excluded; and lavished on the monks of their own kindred the affection and reverence bestowed by other Christian races on the Episcopate and its train. Nor erroneously so. For while the Greek Prelate of the Bulgarian town and plain was too often a mere servile tool and second edition of the reigning Pasha, and his ready co-operator in the task of effacing every vestige of the old nationality, the monk, village-born and bred amid the traditions of his kindred peasantry, himself denizen of some cell ensconced amid the wild recesses of the Balkans where few of the ruling caste would care to follow, kept alive by tale and legend, by mystic rite and secret exhortation, the memories of Bulgaria's glories and greatness, the marvels of her saints, the triumphs of her Czars. His cell was,

for long centuries of forced submission and smouldering revolt, the school of the patriot, the refuge of the outlaw, the link with the past, the hope of the future. And hence it comes that even now, when a native hierarchy has at last occupied the sees left vacant by the expulsion of the Fanariote intruders, while the national spirit itself has borrowed a new inspiration of life from outside influences and contemporary examples, the monastery still maintains its pre-eminence as of all Bulgarian institutions the most characteristic, the most popular, the most revered.

The monasteries of Bulgaria were, and indeed are, legion; they range in size from the solitary hermit's cell up to the crowded "Laura"; but the chiefest of all in the number of its indwellers, the extent of its resources, and the reputation of its sanctity is, and has been for well nigh nine centuries past, the Monastery of St. John of Rylo.

Loftiest of the Balkan ranges, the Rylo mountain, of which Vitos may be geographically considered an outwork or spur, forms the four-fold watershed and limit at once of Bulgaria, Roumelia, Macedonia, and Servia. Its rugged peaks, towering to an altitude of nine thousand feet, from amid a confused wilderness of splintered rocks, precipices, and deep forest-clothed glens, are never free from snow; the view from the topmost summit is said to reach from the Danube to the Ægean. In a winding gorge on the southern flank of this natural fortress, down which a tributary torrent rushes to mingle its waters with those of the Strymon, there nestles at a height of three thousand six hundred feet above the sea-level the monastery of St. John. For seven or eight months of the year it can only be approached, nor, if the winter be severe, even thus, from the valley-entrance opening to the south-west, close by what is now the Turkish frontier. Traversing the long straggling village of Rylo, which, with the vine-covered slopes around it, is included in the demesnes of the monastery, a horse-path leads up between huge perpendicular rocks, into a winding defile, where amid hazel and alder it follows now one bank, now the other of a broad torrent, sometimes keeping close by the water's brink, sometimes suspended high up on a precipitous ledge. Bare at the entry of the pass, the mountain walls, as we gradually gain a higher level, become clothed, first with brushwood, then with trees thickening more and more into dense forest, poplar, ash, maple, oak, till at a level of about three thousand feet the beech, in its noblest forms of growth, takes place of all the rest, and extends in a continuous zone of glossy green till it mingles with the dark pine-groves above; pasture-slopes of a lighter verdure run up here and there between the trees, studded with grazing flocks, the property of the monastery. The red skull-caps and plaited kilts of the herdsmen bear witness, as also do their sallow faces and long hair, to Macedonian origin. Yet they are Bulgarians, nor less genuinely so than their fur-capped, tight-trowsered, ruddy-faced brethren of the North. The apparent difference is the result of disparity, not in race, but in circumstances and climate.

After riding thus for several miles we quit the wide mountain-gorge and its river, said to have run red with blood for seven days when the victorious Turks, at the close of the fourteenth century, penetrated these passes and massacred every inhabitant, monk and priest, cottager and herdsman, man, woman, and child of the many villages that occupied the heights whence these waters descend, since which time to the present this region has remained comparatively uninhabited. We now turn North-Eastward into a pass narrower and wilder than that before traversed, up a rapid ascent overshadowed as we climb by giant trees, and ever hearing, though only seeing by occasional glimpses between red crag and mottled tree-trunk, the foaming torrent below; till of a sudden the rocks to our left hand draw back, leaving a small green plateau between them and the precipice on the right, the trees open out, and the monastery of St. John rises lofty and grey on the level close before us. Seen from without, its appearance is that of a huge quadrangular fortress—with walls sixty feet in height, over which peer out the glittering tops of clustered cupolas, surmounted by gilt crosses. The entrance door is low and iron-grated; the windows, except on the upper part of the side that overhangs the torrent, are mere loopholes; a high-pitched roof, with countless stone chimneys, picturesque in their irregularity, completes the outline. The date of the entire building, with one remarkable exception which we will describe further on, extends from the year 1767, when the older monastery was levelled to the ground during the reign of Sultan Mustapha III. by Turkish—some say Albanian—destructiveness, down to 1844, the year of its completion as it now stands.

Escorted by half-a-dozen monks, who, attired, Basilian fashion, in coarse gowns of dark serge with cowl and girdle, have come to our welcome at the gate, we enter the court—a spacious, but irregular, quadrangle, its greatest breadth being about one hundred and ten yards, its least about seventy. Tiers of arcades, varying somewhat capriciously from three to five, one above another, form the sides of the area; behind them wide galleries run all round the building, one as yet incomplete corner excepted; and broad, open staircases lead up to story after story from the court. Opening into these galleries, from which they chiefly receive light and air, are the cells and other apartments of the monastery. The refectory, stone-vaulted and supported on massive columns, but used only on Sundays and feast-days; the huge kitchen, famous for its cauldrons of Homeric dimensions; the cellars, in one of which is a wine-cask nearly equal in size, though not perhaps in the quality of its contents, to that of Heidelberg; the store-rooms, the library, the wardrobe, and the like, occupy most of the lower or ground story. The upper rooms—second, third, fourth, and fifth stories—are on two sides of the quadrangle, partly tenanted by the monks, partly left to guests of the higher classes; those on the two other sides are allotted to the pilgrims who, to the number of two thousand and more, throng the monastery at certain stated festivals, the most popular of which are that of the Assumption and that of St. John of Rylo himself in the fall of the year.

The monks' cells are comfortable, clean, and tolerably well furnished; that of the hegemonos or abbot, a larger apartment than the rest, does duty for general parlour; though, indeed, no convent rules of enforced silence or churlish seclusion interfere to prevent conversation in any part of the building. The monks themselves, once reckoned by hundreds, now make up barely eighty; and, judging from the small and yearly diminishing number of students or novices who present themselves for admission, will probably dwindle to a yet lower sum. This is not owing to any growing indifference on the part of the people at large to the national faith and rites, to both of which the Bulgarians of our day are sincerely attached; it is merely the natural and inevitable result of those recent events which have opened access to so many secular careers closed during past centuries of Turkish rule to Bulgarian youth. From forty to fifty lay-brothers help the priests in the cultivation of the monastery lands, which extend from the very crest of the mountain far down into the plain. A small body of guards, called pandours, is, by immemorial usage, attached to the establishment; they are said to have done good service in keeping off Turkish marauders during the late war. Their quarters are without the gates. Female pilgrims, if accompanied by their guardians or relations, are however freely admitted within the building; a liberty which seems somewhat startling at first sight, but which is, in truth, apter to prevent scandal than to give rise to it. The monastic rule here followed is, as everywhere throughout Bulgaria, that of St. Basil, but not according to the stricter form of observance, each monk having a right, under certain conditions, to private property; the vow that binds to the order is indissoluble. In administrative matters the hegemonos is supreme, but the bishop of the diocese has the right of visitation, and any serious breach of discipline is promptly and severely punished.

From five to eight hours, according to the varying prescriptions of the calendar and the ritual, allotted to daily chant and prayer, afford a tolerable guarantee against idleness and its consequent evils; while the practice of manual and field labour is doubtless an additional safeguard. Yet the absence of study, or, indeed, of any kind of literary occupation whatever, among the monks is much to be regretted. True, the monastery once possessed, or is said to have possessed, a copious library, rich in manuscripts and historical records; but the part of the building which it occupied was in 1830 ravaged by fire, and a small and insignificant collection, in which catechisms and treatises of Russian divinity and Prayer-Books sent from Moscow figure conspicuously, is almost all that the brethren have now to show. A charter bearing the signature in vermilion of Shishman III., the last of the Bulgarian Czars, is the oldest document yet preserved among the convent records, which also include several firmans granted, not gratuitously, by succeeding Turkish Sultans, from Mahomet II. down to Abd-el-Azeez. The popular belief that creates, in secret vaults somewhere below the building, stored up treasures and chests full of costly relics, is as idle as such imaginings usually are; the reserve wealth of the establishment is, in fact, deposited in Roumanian and Russian banking accounts much more securely than it could be in the underground cellars and secret chambers, real or fancied, of the often-pillaged monastery itself.

WHAT IS USURY?

THE defending of theses which have no practical interest has not, it is believed, yet entirely lost its old attraction, and therefore it may be anticipated that the correspondence between Mr. Ruskin and the Bishop of Manchester which appears in this month's *Contemporary Review* will not lack readers. The subject is an extremely important and an eminently unpractical one. It does not need very close study of history to know that when a practice has for many ages been regarded with varying degrees of reprobation, when it has subsequently passed through a period of oblique toleration, and has at last attained to full freedom and recognition, there is not much chance of this process being reversed. Therefore, even supposing that the Bishop had hopelessly failed to make good his case, there would not be much chance of a renewal of statutes against usury; nor, if Mr. Ruskin had been at a loss for a word to say for himself, would the shareholders of the North-Western Railway have felt materially strengthened in their conviction that their dividends are pretty safe from any interference on the part of Parliament, pulpit, or press. Nevertheless the *gaudia certaminis* in such a case are for the spectators, as well as for the actors, not small. Mr. Ruskin is one of the very few amusing and inspiriting controversialists we have left. He has all Mr. Gladstone's belief in his cause, with a much greater mastery of word-fence and of the peculiar semi-polite Billingsgate without which such a controversy is very poor fun. On the other hand, the Bishop of Manchester fairly deserves to be ranked at least among the lesser *promachi* of miscellaneous debate. Dr. Fraser is not the best of arguers in a novel or doubtful cause, because in that case he is apt to get crotchety, and his crotchets are more eccentric than amusing. But of a

strong position he generally manages to make a good deal; and in this particular instance all that was required of him was to keep cool and talk common sense.

The Bishop had another advantage, his use of which was probably accidental. He evidently managed in the first round to put his adversary out of temper. Mr. Ruskin has for some years been challenging the clergy in general, and the Bishop of Manchester in particular, to answer him about usury, as readers of *Fors Clavigera* very well know. But the Bishop, it seems, has only occasionally read his *Fors*, the eccentric publication of which confines his acquaintance with it to the "rare occasions on which he uses his privileges as a member of the Athenæum Club." Here it is to be observed that "rare occasions" is good, inasmuch as it creates a favourable idea of the hard-worked prelate who seldom leaves his diocese. However this may be, it seems that Dr. Fraser did not see the challenge until it was quoted in some recent remarks of Mr. Ruskin to a clergyman, also published in the *Contemporary Review*. After this preliminary stroke, which Mr. Ruskin evidently did not like, the Bishop attacks his subject in a manner not discreditable to his Oxford training. What is usury? he asks, and proceeds to define it, as most people would define it, to be, not interest, but excessive interest. He points out the various classic passages in the Old Testament on the subject, urging that all of them refer to abuses, not uses of the practice; quotes his own case as an investor in the London and North-Western Railway, the case of a landlord who demands interest for money spent on draining, &c., and generally adopts what may be called the plain, common-sense view of the matter. Indeed, if there be a fault in the letter, it is that it is too purely common sense. Controversially this might have been expected, but there is perhaps something of a false note in the fact of a prelate of the Christian Church taking lower ground in such matters than a casual layman. This indeed gives Mr. Ruskin the opportunity of the only point which he really makes in his rejoinder. Referring to the Bishop's frank and engaging account of his disposal of his income, Mr. Ruskin suggests that a Bishop's stipend may possibly have other objects than accumulation. In other respects, however, the opponent of usury is not so happy. He wastes his time on mere verbal quibbles about the number of *Fors* in which his challenge originally appeared, about the fact that he mentioned the Bishop by title, not by name, and so forth. He does not touch at all the really important point that the various mentions of usury in the Mosaic law clearly discriminate between various applications of it. He is very discursive, occasionally apocalyptic, and not unfrequently rude, as when he talks of the Bishop "taking a commission on the refreshments of passengers." Moreover, he gets himself into a perfectly unnecessary difficulty by some digressions on great cities and their sins. A previous reference to Manchester had brought down a rather indignant protest from Dr. Fraser, who, to do him justice, is equally outspoken in rebuking the faults of his cathedral city himself, and in defending her against outside assailants. In the course of Mr. Ruskin's rejoinder to this he engages in some rather unsavoury details on the subject of "remunerative employment," and lays himself open to the retort that, although he can recognize no distinction between different kinds of usury, there are other kinds of sins in which he is by no means so scrupulous. In short, Mr. Ruskin seems to have rather lost his opportunity, now that he has had one, of exhibiting to a somewhat wider audience than the subscribers to *Fors* and the readers of Mr. R. Sillar what he really has to say against interest. The plan of annotation rather than connected answer which he has adopted, though admirably suited for the gaining of mere dialectic victories, is by no means admirably suited to obtain the assent of cool and intelligent persons; while in this particular instance, as we have seen, even the dialectic successes which Mr. Ruskin's method has secured him are not great. He has said some unpleasant things about Manchester and its Bishop, and has spoken disdainfully of the apostles of "remunerative employment." But the conscientious man—if we may suppose the existence of such a person—who is awaiting with doubt and discomfort the arrival of his next dividend warrant will not, we think, find his doubts either confirmed or removed by Mr. Ruskin's part in this correspondence.

The truth is—and if the Bishop's visits to the Athenæum had been frequent enough to perfect him in the study of *Fors* he would have perceived it readily enough—that Mr. Ruskin's objection to usury is only part of a much wider objection. Dr. Fraser innocently suggests that the great commercial enterprises of the country could not get on without the arrangement which enables people who have superfluous cash and no means of profitably employing it to lend it to those who have means of profitably employing it but have not got it. Now Mr. Ruskin's attentive readers know very well that he has not the slightest wish to encourage the great commercial enterprises of the country. It would probably, indeed, without the dubious references to usury to be found in the Scriptures, have been quite enough for him that usury facilitates commercial enterprises. His ideal is a community of small private expenses and of public expenses large only in the case of art, where the inhabitants shall exchange products and goods according to a system of barter or something not unlike it, and where great commercial enterprises would therefore be as unnecessary and as tabooed as they might be in a new Sparta. A railway, the Bishop might also have known if he had chosen, is an abomination to Mr. Ruskin. How then shall he be pacified by the picture of Dr. Fraser investing the surplus of his income in the London and North-Western? Cotton mills, except on a small scale, are equally an abomination. Is Mr. Ruskin, then, likely to be won over to the cause of interest on money by being informed that Oldham would have had so many thousand fewer spindles if interest did not exist? The Bishop is arguing from the point of view of the state of England, Mr. Ruskin from the point of view of the state of Utopia. If it be necessary to go into questions of Scripture quotations at all, it is clear that Mr. Ruskin has not got a leg to stand on. The prohibition of usury between Jews, at least where the borrowers are in distress, and the express license of it where the borrower is a stranger and in decent circumstances, put the whole thing in a perfectly intelligible light to any reasonable mind. Usury, as now practised in Mr. Ruskin's sense, is almost invariably for the profit of the borrower, and not to ward off some calamity from him. Indeed, in the latter case he would generally find some difficulty in getting any money lent to him at all—a result which may tell against civilization, but certainly does not tell against the practice of moderate interest. For our part, we cannot easily imagine the condition of Mr. Ruskin's ideal commonwealth if it be conducted on the strict principle of "not taking up more than you lay down," which he announces as the law of commercial transactions. Is the shoemaker, for instance—to adopt one of the most Socratically simple of trades—to receive nothing more than the sum expended on his leather implements and thread? If so, it would seem that the community will shortly be without a shoemaker. But perhaps Mr. Ruskin will say that there is a margin of livelihood due to him for his skill, time, and work. Here, however, we detect something very like the "delicate adjustment" of principles which he himself so vigorously condemns. It is quibbling to say that the shoemaker "laid down" such impalpable things as time, skill, and labour; or, if it be not quibbling, no more is it quibbling to say that the lender "lays down" the possibility, which would otherwise be very literally impossible, of profit to the borrower. At any rate it is rather a problem for Didius and Tribonius, and others of Sterne's memorable civilians, than for ordinary folk. As to the real question of usury as it appears to sensible men (and as certainly none of Mr. Ruskin's quotations forbid it so to appear), it may be very shortly disposed of. It is no doubt according to any system of high morality—except, as history informs us, the Stoic—wrong to make capital, as the phrase goes, and here goes particularly happily, out of the necessities of others. But it is not wrong to make fair interest on capital. It may also, in still more delicate systems of morality, be regarded as wrong to lend money in encouragement of overtrading, speculation, and so forth. If, however, this principle be admitted, we see a difficulty in the way of the Company of St. George itself. For its members clearly must not lend each other knives without previously satisfying themselves that the borrower is in a sane, charitable, and cheerful condition of mind. But that it should be wrong to do what is not forbidden by any law, and what is, if properly done, profitable to everybody concerned, is a mystery which we cannot attempt to solve. Even in that much misunderstood country, Utopia, it is not clear why interest should not be allowed. Citizen Eumenes has had a bad year, and cannot quite afford the sum necessary to buy his seed potatoes. Citizen Diotimus has had a good year and has something to spare. Why should he not lend it to the other and share the result, to which he has fairly and notably contributed, being indeed something of a *causa sine quâ non*? Mr. Ruskin himself admits that under his system it would probably be difficult to obtain loans at all, and that the ordinary "Christian" would require to be very strongly reminded of a certain precept not "to turn away." If this is by his own account the attitude of humanity towards such precepts, it seems a pity to add to those which do exist with some authority, others which do not. We fear that the average natural man will be prone to remind Mr. Ruskin that there is only one clear and definite prohibition of interest as interest in the Bible, and that that precept forbids the taking of it by Jews from Jews. "Now," will this natural man say with strict truth in every case but one in a thousand, "I am not a Jew, and therefore your precept does not apply." Such are the sorrowful chances of working the literal method too hard.

VILLAGE CONCERTS.

THE feelings of guests at a country house when their hostess announces a village concert as an "entertainment of obligation" for the following day are a subject into which we are not prepared to inquire. There is a simplicity about the title of the event which is in curious contrast to the consternation spread by the alarming information. The programme of the day of the concert is divulged at breakfast. The morning's skating must be cut short, because luncheon will be half-an-hour earlier than usual. The gentlemen will please to amuse themselves as best they can in the afternoon, taking care to return home early, as dinner will be at five o'clock. The villagers think a great deal of seeing their betters in evening dress; it will therefore be necessary to begin to dress at half-past four. If there are some shortcomings in the dinner, people must be so kind as to make allowances, as some of the servants are going to the concert, and will have to get ready early and walk. The passing of this terrible sentence is received in solemn silence; but when the gentlemen assemble outside the house for their morning cigars,

there are pitiable lamentations, combined with unedifying maledictions, and the early part of the day is spent in melancholy anticipations. A deep gloom hangs over the whole party, and all attempts at amusement are chilled by either the arrangements for or the prospect of "this confounded concert."

The agony begins with the five o'clock dinner; but on this painful subject we will not dwell. It is sufficient to say that the meal combines the horrors of a Sunday in a house of the "save-the-servants-trouble" type with those of an agricultural show dinner. There is no time for coffee, and the party is hurried off with alarming punctuality. The scene of dissipation is a village schoolroom. A strong bouquet of paraffin pervades the building. There is a dense crowd, and the atmosphere is already both hot and oppressive; but nevertheless sneaking draughts attack one's feet and the back of one's neck. Although we were hurried mercilessly to the scene of action, there is a delay of twenty minutes before the commencement of the concert. The clergyman mounts the platform and says that he has been desired to announce that one of the leading performers is unavoidably absent, but that some one else has kindly consented to take her place, and he makes a small joke about "rushing into the breach." The first entertainment is a performance on hand-bells, of which the party with whom we are concerned obtain the full benefit, as they are seated in the front row of chairs. "Oh, where, and oh, where, is my Highland Laddie gone?" is clanged out until the hearers' tympanums begin to ache; "And it's there, oh, it's there," is continued with merciless vigour. These instruments of torture cost more than a sovereign apiece, and a dozen of them have been kindly supplied to the village club by a philanthropic lady living in the neighbourhood. The ears of the audience having been thus numbed, a recitation follows. The man who gives it is a miller residing near the village. His intellect has been cultivated at a commercial school, where he was considered a clever lad. He is deadly pale, but there are dewdrops on his forehead. He starts off with a dash, stops, coughs, looks at his book, stutters, and finally goes off like a machine. In order to appear at his ease, he thrusts one hand into his trouser pockets, occasionally waving the other, which holds his book, in the air. Without pause or hesitation, he dashes through the piece, pulls up with a jerk, and hurries off the platform. The audience do not seem to have had the least idea of what he has been saying, and the performance has resembled one of those provoking fireworks which go off with a bang, instead of fizzing and whirling and throwing out periodical jets of coloured fire. The next entertainment is to be a selection of airs played upon the harp by a countess. Now this harp is known to have cost many hundred guineas, and to be a magnificent piece of workmanship as well as a remarkably fine instrument. A crowd of rustics had watched its arrival in the morning, when it was brought out of a spring van, swathed in blankets. The harpist strikes a few introductory bars, but then stops short. There is a beckoning and signalling. Somebody brings a tuning-key. The precious harp is out of tune. "Do," strikes a friend upon the piano, with one finger. "Do" goes the harp; but unluckily the two "dos" do not agree. Again they try—"Do—do, Re—re, Mi—mi, Fa—fa." There is a whispering. There are consultations. It is given out that, in consequence of a draught, the harp has "run down," and that a thorough and deliberate tuning being necessary, it is impossible to use it during the evening. The next performer is the daughter of a farmer in the neighbourhood. Now a member of the party from the country house considers himself a musical critic, and on the way to the concert he had enlarged upon the beauties of the old English melodies; but when the farmer's daughter sings "Sally in our Alley" it is too much for him. This was one of his favourite English songs, and he had been comparing the simple beauty of this seventeenth-century composition with the songs of the present time, very much to the disparagement of the latter; yet he fairly winces when the rustic maiden brings out the "Sally" and the "Halley," after a pause at the ends of the lines. "The one day" and the "Monday" are even more energetically delivered, and when, after a loud encore, she sings "Oh, breathe not his name," with excruciating pathos, the connoisseur mentally forswears all ballads for the future, as she screams and moans that "the tear that we shed, though in se-cret it rolls, shall long keep his memo-ry green in our souls."

Then follows the lion of the evening, who is to give a reading. To the rustics his powers as a reader are of secondary importance, the interest attaching to him consisting mainly in his being a peer of the realm. As such he is something to be stared and wondered at. His nose, his whiskers, his white tie, his very trousers are all objects of breathless interest, as he stands at full length to be gazed at, free of charge, by the villagers and farmers. Of course the piece which he has selected is out of one of Dickens's books, and he says with solemnity, "I am going to read something out of *Pickwick* to you." With his chin well tucked in he begins. The beginning of the chapter is a little heavy, and the audience look with eyes of wonderment upon the reader, without paying the least attention to his words. As he becomes interested his voice gains strength, and he goes on with a measured swing, regularly dropping his voice at the end of his sentences. There is something about his monotonous style which sounds familiar; but at first we cannot say exactly of what it reminds us. It is not the tone of a man making a speech, nor that of a clergyman reading a service. Suddenly we recognize it. It is the style of a paterfamilias reading prayers. There is no mistaking it. Despite his efforts to be brilliant he has relapsed into the manner to which he is most accustomed, and he reads on solemnly with the regularity of a pendulum. He tries to throw some spirit into the remarks of Mr. Weller, but without effect, and the audience does not laugh. Indeed it is probable that the larger number of his hearers would consider it indecorous to laugh in the presence of such a man. He is seized with the idea that the piece is too long, and he turns hurriedly over a page to see whether it would be possible to do a little judicious skipping. He loses his place and becomes nervous, and observing that even the most humorous passages do not amuse his hearers, his voice becomes more spiritless than ever. Presently somebody laughs, and some-one else hearing it laughs also. There are few things more infectious than laughter, and soon the occupants of the back seats are indulging in it heartily. They are pleased to find that there is nothing improper in laughing before the great man, and after their previous gravity the reaction is all the stronger. The reader being encouraged, he throws a little more life into his words, and even makes a lame attempt or two at humorous action, at which the sitters on the back benches roar with delight. The thought of his own humour makes the reader laugh too, and his voice consequently breaks, and with a fit of coughing he brings his performance to a conclusion.

The surgeon's apprentice sings "The girl I left behind me," and the audience, having found their voices, give an uproarious encore. The youth then begins a song not on the programme, which gives immense pleasure at the further end of the room. The ladies and some of the gentlemen, however, take exception to it. It is "not at all a nice song"; in fact, "it is a dreadful song," and how could the vicar have permitted such a song to be sung at the concert? Where is the vicar? And then there is a solemn whispering. The vicar says that he required the performers to submit every song for his previous approval, but this objectionable ditty being an extra and not on the programme, he naturally knew nothing whatever about it. Lady Jane Grundy talks of taking her party away at once, but Sir Thomas and the vicar persuade her to remain. The young gentlemen who had been so bored at the whole day's proceedings do not appear as much shocked as the circumstances require. In fact, some of them are smiling for the first time since breakfast. After this over-seasoned meat nothing pleases the audience. A lady sings a Scotch song with great feeling and finished vocalization, but it passes unnoticed; and when a long song has been endured, the refrain of which is that somebody—no one knows who—is "always the same, the same," it is a relief to everybody to stand up, sing "God Save the Queen," and go home. When our party reassemble at supper, it is tacitly understood that whatever people may think or feel, they are to say that "it all went off capitally—except that dreadful song."

A village concert may not appear a very serious or important event, and the boredom of a few idle and pleasure-loving guests may seem more absurd than pitiable; but there is another aspect of the question. Many people have little or no idea how much owners of country houses bear for the sake of encouraging these village festivals. Half their success depends upon a strong support from the upper classes and a good show of well-dressed people. The host and hostess, therefore, who are willing to bear the odium which they are pretty certain to incur by taking a large party of guests to one of these entertainments deserve some credit. However excellent your champagne and claret, whatever be the number of tame pheasants which you enable your guests to shoot in a week, and be the ball with which you enliven one of the evenings as magnificent as money can make it, you will require an amazing amount of both tact and good temper to marshal your party through one of these village concerts without misadventure. In these days the model working-man is taught many things, and he is supposed by some people to know even more than is good for him; but, whatever he may have learned about the franchise, the principles of free trade, or the discoveries of modern science, he rarely understands what a self-denial and discomfort it is to a person who always dines at half-past seven or eight o'clock to be obliged to dine at five. Then, again, the good people who get up these concerts and make all the necessary arrangements have a great deal of trouble to undergo; while the kind neighbours who lend pianos, harps, and the services of their workpeople for the cause are not only put to great inconvenience, but are also exposed to severe trials of temper. Altogether, we think that a great deal of good feeling between rich and poor results from village concerts; and that, as a rule, much credit is reflected upon all who have been concerned in them—always excepting the man who sang that dreadful comic song.

STREET INDUSTRIES IN WINTER.

WE can understand that there must be a certain fascination in the life of the industrial wanderer who follows his calling through the fine season in picturesque districts in the country. Whether he trudges it on foot or travels in a caravan, whether he is a mender of pots and kettles or a vendor of wicker-work chairs, he has probably established a profitable connexion and must certainly have his times of enjoyment. It may be disagreeable enough to buffet your way against a bitter March wind, or to plunge through the rain and the lanes over the ankles in mud; but there is no lot in life without its drawbacks, and the rural wanderer has always something to look forward to. We take it for granted that he has money in his purse, or rather in the bag or

dirty canvas that he knots up in intricate complications of twine. He is a welcome guest at the roadside public-house, for he is sure to come in with the gossip of the day, and is always ready with a song, a jest, or a story. He calls for his bacon and eggs, or bread and cheese; and he ekes out his beer with contributions from the local tipplers, who regard him as a decided acquisition to their circle. But in nine cases out of ten he need not fall back upon the alehouse. He has been busy over his jobs at some out-of-the-way farm, and takes care to prolong them to the hour of supper. Of course he is hospitably invited to the meal, and he does ample justice to the solid refreshments. Then he retires to sweet repose in the hay-loft or on the yielding truss of straw in the barn, and sleeps the heavy slumber of the hard-working man, to begin the wanderings of the morrow with a liberal breakfast. Still pleasanter, so far as appearances go, is the gipsying of the family parties in the caravans. They have their regular nooks of call and sojourn, chosen for natural advantages which have been recognized long ago by their experience. There is the wooded bank that breaks the wind and rain when they are blowing roughly up from the exposed quarters. There is the copse, from which the pilgrims can gather the dry firewood, somewhat to the indignation of the lord of the manor, who seldom, however, cares to interfere with people who might do his coverts a mischief. There is the high-road in the lane hard by, for they like a cheerful sense of companionship; and, as they never by any chance carry clocks or watches, it is an object to be within shouting distance of better-provided passengers. Above all, they are near the limpid spring at which they can fill the indispensable tea-kettle. You may even envy them, with their weather-browned faces, excellent spirits, and hearty appetites, as you see them seated of an evening at the *al fresco* repast, with the slanting beams of the setting sun falling through the boughs of the trees on the green table-cloth of turf. Nor are they altogether to be pitied even in bad weather or in the winter, when the low temperature or the nipping blast has driven them indoors. Theirs may be somewhat cramped quarters, within the rickety caravan that can be drawn by the single screw who picks up his living in the ditches. Yet you see a rude reflection in it of the comfort, though more regardless of expense, which Dickens immortalized in the vehicle of Mrs. Jarley of wax-work celebrity. The light from the tiny stove is glimmering through the scarlet curtains; the solitary dip candle or horn lantern shines upon the heads of a Rembrandt-like group clustered round cups and loaves and a capacious teapot; while there is a brisk sound of hissing and an odour in the air which tell of rashers or sausages, or similar delicacies. In short, the tramps in the country who work for their living are for the most part well clothed and better fed; and often, if they avoid temptations to drink, they have snug little sums invested somewhere.

Very different is the lot of some of their brothers and sisters in the cities, and especially in London. Of some of them, we say; for there are street vendors and street vendors, and in that as in all other callings, from the Church and the Bar downwards, there is a wide variety of grades and fortunes. Many of the costermongers and of the people who keep street stalls in the East End and suburban thoroughfares do very well indeed. The latter are regular tradesmen in their way, standing on their respectability as compared with the nomads, while they enjoy the advantage of dispensing with payment of rent and knowing nothing of rates and direct taxes. It is their business to sell cheap, and their interest to sell good, for they have their habitual *clientèle*, fastidious in its way, and quite ready to transfer its custom to the pushing rival over the way. So with the costermonger who goes his rounds with his barrow, or who has accumulated reserves sufficient to start him with a donkey-cart or perhaps even a pony-trap. He makes his circuit as methodically as the sun, and his appearance is expected with far more confidence. Should he be very far behind time, he may find his market forestalled. So he must be up before daylight and beginning his business in the darkness. Any morning in Lower Thames Street, near Billingsgate, or in the neighbourhood of any of the great vegetable markets, you may see the costermongers' carts and barrows "stopping the way," or at all events wedged tightly together in files at the sides of the thoroughfares. The masters leave them in charge of their helps while they are gone themselves to make their bargains. They must necessarily buy what is cheap; but it by no means follows that they buy what is nasty. With perishable articles, specially such as fruit or fish, they may often make a most profitable hit. Sprats—which are the smelt or whitebait of the poor—are perhaps literally being given away; or there is an extraordinary glut of herring or mackarel. Strawberries, slightly the worse for a Channel voyage, are coming in by the bushel at the height of the season; or a consignment of West Indian pines has been slightly bruised in the disembarking in the dog-days. Yet quotations in these luxuries rule pretty steady beyond the reach of market reports; and, with an insignificant reduction in his usual rates, the merchant fills his pockets as he empties his barrow. Then he has the advantage of being able to change his wares with the season and the demand; and, in one way or another all the year round, may reckon pretty confidently on the average of his receipts. In our opinion he is decidedly more to be envied than the tenant of the fixed stall. He has variety of occupation as well as change of scene. He is not being perpetually exasperated by the vociferous competition of a next-door neighbour in the identical line of business, who lures away his customers under his nose and irritates him with surprises in the shape of counter sensations. He forms a wide circle of agreeable acquaintances, and can indulge himself in gossip and flirtation with matrons and maids-of-all-work, when, his goods being pretty nearly disposed of, he can dally over those that hang on hand. Then, should his tastes tend to the convivial, he can afford himself an occasional pint of ale or a glass of "something short"; and if he must be up and about before the early sparrows, he can keep early hours in going to bed, to the saving of fire and candles in winter.

It is when we descend a step or two in the social scale, that we find the street industrials really to be pitied. On the border-land between the well-to-do and the miserable, we should be inclined to place the merchants in coffee, hot chestnuts, and baked potatoes. It is in the bitterest or most ungenial weather that they should drive the briskest trade. Quick returns must in themselves be inspiriting; and however low the thermometer may be, they have a fire or stove at which they can thaw their fingers, while the very glare of it, as it falls on the mist or the mud, is in a certain sense cheerful and companionable. But, on the other hand, their clothing is generally of the flimsiest, and unpleasantly out of keeping with the season of the year. A ragged woollen comforter, twisted and knotted round the neck, is crossed on the chest under a tight-buttoned frock-coat which has been worn to the last stage of attenuation. If the upper half of the body is baked on one side, the other is chilled or drenched, as the case may be; while the ill-shod feet have lost all sensation as they slip about on the broken boot-soles in the half-frozen mud. And the worst is that the most miserable weather may be against those merchants, unless, perhaps, in the case of the coffee-dealers. No doubt when the bleak north wind is howling through the driving sleet, a smoking potato or a handful of hot chestnuts may recommend themselves more to the digestive organs than penny ices or periwinkles. But the shivering passenger may hesitate as to taking his frozen fingers out of his pockets; while he may be rather inclined to reserve his coppers for a mouthful of fire from the gin-palace at the corner. Similar considerations apply even more directly to the unfortunate crossing-sweepers. In fine weather their services become superfluous, and nobody seems to consider it worth his while to remunerate them for making play with their brooms on clean and dry thoroughfares; while in wet or wintry weather, when they are really public benefactors, the hand that should be liberal is occupied with the umbrella, and it is quite out of the question to unbutton the overcoat to get at the pennies which are deposited in a pocket out of reach. As for the itinerant organ-grinders, one must of course regard them as unmitigated nuisances. Next to them come the street singers, who at once excite our resentment and some faint sense of compassion, though they obviously hope to terrorize us out of coppers. They try to be most tuneful in the most inclement weather. Under pretence of gratifying the public taste, they screech out their ballads through a husky throat from the bottom of a cold-ridden chest. The miserable scantiness of their attire may be part of the professional get-up, as the children who come limping at their parents' heels might very well have been left at home under shelter. But as to considerable actual suffering there can be no mistake, as you would find yourself were you to cast off your great-coat, throw open your shirt front, strip off your stockings, and crawl at a foot's pace through the street from breakfast-time to a late supper hour. Far more objectionable are the sturdy "seamen" who have had their timbers shivered in the service of an ungrateful country. One of them has apparently had a leg carried away in action; another shows an empty sleeve in the place of a strong right arm; and a third wears a grim patch on one eye, while the sticking-plaster stretching down over the cheek hides what may be supposed to be a ghastly cutlass slash. The distribution of their losses is too symmetrical and the imposture should be clear to the dullest capacity. Probably, if you had the party strictly searched, you would discover the missing limbs about their persons, while the eye may be winking under its bandages. There can be no question as to the soundness of their lungs, for they are bellowing out the "Bay of Biscay" in stentorian chorus. But they appeal successfully to that love of the British tar which used to bring down the galleries at transpontine theatres; and they awaken sentiments somewhat stronger than disgust when you see them drawing money as well as audiences. We entertain somewhat softer sentiments—though we fear it is a culpable weakness—towards the plaintive old ladies who offer you boxes of matches or vesuvians, or the faded women in the forlorn garb of widowhood who lie in wait for you with muffatees at the approaches to the Clubs. Perhaps they are impostors, and if you give them a bit of silver to get rid of their importunities, it will most likely be spent at the nearest public-house. After all, however, the responsibility for its disposal is theirs, and if the case seems to leave room for a doubt, it may be allowable to give them the benefit of it.

THE FEVER ON THE STOCK EXCHANGE.

THE rapidity of the late speculative revival is a notable feature of the present time. Twelve months ago we were in the depths of the discredit caused by the Glasgow Bank disaster and the numerous failures that followed after it. Speculation did not exist, and even legitimate business was paralysed. This state of things lasted until the beginning of the summer, when we called attention in these columns to a faint renewal of activity on the Stock Exchange, remarking that, if we were about to witness a

return of commercial prosperity, it was in a revival of speculation that we might expect to see its first beginnings. As the summer wore on, however, the constant rains which did such damage to the crops damped the spirits of the frequenters of Capel Court. At length, in the course of the autumn, a genuine burst of speculation set in, which has gone on increasing ever since until it is assuming the dimensions of a mania. Both New York and Paris had been the scenes of a wild speculative fever in the earlier months of the year, and members of the Stock Exchange and others who had intimate connexions with those cities were moved to envy by the stories which reached them of immense profits realized by a few happy ventures. They were therefore prepared to take advantage of the sudden turn in trade which occurred just at the same time. The Americans, favoured by a succession of three abundant harvests, found themselves in a position to resume the work of development interrupted by the panic of 1873, and began to give large orders for English iron and steel. The sudden activity thus imparted to the iron trade gave courage to business men, and to none more than to the principal operators upon the Stock Exchange. There are many reasons why, as we have already observed, a revival of trade should be ushered in by an outburst of speculation on the Stock Exchange. Its members are, as a body, a highly intelligent and very acute body of men. They have relations with the principal firms in nearly every branch of trade, and thus have excellent means of early and accurate information. Concentrating their attention upon a comparatively mall number of securities, they are able to avail themselves to the fullest of this information, and thus to anticipate coming events. The great City houses are still better placed, each in its own special line, for forecasting the immediate future. And the speculators, pure and simple, are generally sharp and well informed; at the worst, they can follow the lead given by the other classes. When a revival of trade is setting in, people generally have got tired of stagnation and over-caution, and are eager for enterprise and large and bold combinations. The frequenters of the Stock Exchange are full of this new spirit, and act promptly on the first symptoms of returning prosperity. When their ventures prove successful, they try again and again, and each new success gives them courage for larger and bolder strokes, until the moment arrives when the more far-seeing among them feel that the time has come for realization. Last autumn there was this impatience for new enterprise, together with an undoubted revival in some of the principal industries of the country, and there was likewise exceedingly cheap money. This latter circumstance is essential to such a movement as we have been tracing. A vast speculation, such as has been in progress since September last, cannot be carried on without the help of the banks. Very few speculators have money enough to deal on a grand scale; they would soon come to the end of their resources if they could not use their credit largely. Last autumn the banks were as eager to lend as the speculators were to borrow. During the weary years of depression money had accumulated in inconvenient amounts, bills were scarce, the demand for discount was small, and, in short, the means of earning profits were few. In these circumstances bankers were glad to accommodate speculators, and thus the movement went on smoothly and rapidly.

The speculation has been active in every kind of securities. Consols, indeed, had risen so high in the previous period of discredit that a further rise was hardly possible; yet they remain, even now, at a height most unusual in a time of reviving trade. Partly this is due to the cheapness of money of which we have just spoken, and partly it is due to the scarcity of the stock. By the action of the Sinking Fund, old and new, the National Debt is being considerably reduced; while there is a constantly growing demand for Consols from the Savings Banks, from trustees, and generally from persons who desire an unquestionable security. The price of Consols, then, is little affected by the course of speculation. But there is a distinct and remarkable rise in Indian and Colonial securities. In foreign bonds of all kinds the rise is still greater, and more general. In home railways, again, it is excessive. But perhaps it is in the miscellaneous securities, and particularly in mining, iron, and metal shares generally, that it has reached its greatest height. To quote but a few instances, we find, taking the prices at the last settlement—that is, at the end of last week—that Bilbao Iron Ore shares had risen in a month from 17 to 35—in other words, had more than doubled. Darlington Iron shares, which on June 28 were quoted ½, on December 27 had risen to 6, and last week were 11; Ebbw Vale shares on June 27 were 1¼, and last week were 14¼; Sheepbridge Coal and Iron on June 28 were 29½, on December 27 were 64, and last week were 84. Devon Great Consols on June 28 were 1¾, on December 27 were 6½, and last week were 17. Rio Tinto on June 28 were 3⅝, on December 27 were 9. Confining our attention now to a short period, we find that at the last settlement Argentines had risen in a single week 2½, Hungarian Gold Rentes 3¼, Russians of 1875 2¼, Turkish Tribute Loan 2½, Venezuelan Sixes 2, Bolivian 1, Mexican 1¼, Spanish Land Mortgage 1, and Paraguayan ½. In the same short space of a week we find that Lancashire and Yorkshire shares had risen 3½, North-Western 2½, South-Western 2, and Chatham and Dover 2¼. It would weary the reader to add to this list, which we have offered only for the sake of giving an idea of how much the rise has been since the beginning of the speculation, and also of showing that the movement has lost none of its force, but rather is proceeding at an accelerated pace. To a certain extent the rise has been justified. Assuming that the revival of trade is genuine, as undoubtedly it is believed to be in the City, it is a matter of certainty that the railways will have larger traffic, and consequently will be able to declare better dividends until, at least, wages and the prices of materials are again run up so high as to neutralize the effects of increased earnings. The speculators foresaw this, and discounted the profits of the future. We have not a word to say against such discounting within proper limits, but it is difficult to believe that it has been kept within proper limits. As always happens, unwary and clumsy imitators have servilely followed the lead of the well-informed and the far-seeing, and are carrying to excess a rise which to a certain extent was warranted; at least the prosperity of the next few years must be very great indeed if this does not turn out to be the case. Again, the rise in iron, coal, and mining shares generally is a very natural reaction from the depreciation that had prevailed so long. During the past few years the collapse of the coal, iron, and other metal industries has been so extreme that a great number of the properties had almost ceased to have any market value. When, therefore, the American demand suddenly imparted life to those industries, it was inevitable that there should be a great upward bound of prices. Whether the reaction is not going too fast, however, remains to be seen. Lastly, there may have been room for an advance in the value of foreign bonds, for a deep discredit had settled on this kind of investment generally. But the most noticeable feature of the present speculation in these bonds is that it bears upon the stocks of States which are either bankrupt or in poor credit. There is a vast amount of dealing in Mexican, Bolivian, Paraguayan, Venezuelan, Ecuador, and Peruvian bonds; and, amongst European States, Russian, Hungarian, Austrian, Italian, and even Spanish, securities find favour. This is evidence, not of foresight, calculation, and a right perception of the course in which events are travelling, but of the hope that the public may be drawn in if prices are inflated to a sufficient height and for a sufficient time, and that the speculators may thus be enabled to get rid with a profit of worthless rubbish and doubtful securities.

The movement we have been tracing has its counterpart in every commercial country. As already stated, it was preceded by a speculative mania in Paris and New York, and a similar mania is beginning in Germany and Austria. It is one of the concomitants of the revival of trade, and we may expect to see it continue for a considerable while yet. The general public has scarcely taken part in it, but there are symptoms that it may soon do so. The number of *bonâ fide* investors is increasing, as are also the amounts invested. And the success of recent issues of new projects is a sign that money is forthcoming at the hands of the public. If the revival of trade proves genuine and permanent, funds for all sorts of enterprises will be abundant, and the disposition to employ them will also exist. As a matter of course, when the public takes part in the movement, it will receive a great additional impetus, and may perhaps end in a mania as wild and unreasoning as any hitherto witnessed. Meanwhile, however, there are two dangers that speculators are exposed to. One is a considerable advance in the value of money. Even now, cheap as money is, the rates for "carrying-over"—that is to say, the charges made for enabling bargains to be carried over from one settling-day to another—are very heavy, in some instances indeed are enormous, which affords proof that a large proportion of the speculators are financially weak. Should, then, the value of money rise considerably, these weak operators would probably be compelled to throw their stocks upon the market, and thus to depress prices all round. The second danger is the outbreak of a great European war. This would almost certainly be attended by a panic in the stocks affected. But whatever may be thought respecting these dangers by and by, for the present they do not disturb the speculators, and the movement proceeds merrily.

THE HAYMARKET THEATRE.

THE expectations aroused concerning the re-arrangement and re-decoration by Mr. and Mrs. Bancroft of "the little theatre in the Haymarket" have not been disappointed. It would indeed be difficult to imagine a scheme being more successfully carried out. A full description of the changes made in the house is issued with the playbills, and, pausing only to notice the beauty of the new act drop in which Mr. White has painted figures representing the characters in the *School for Scandal*, which stand out against an elaborate interior painted by Mr. O'Connor, we may be content with observing that a complete revolution has been effected in the inside of the theatre, which is now one of the most attractive and most comfortable in London. One revolutionary proceeding, the abolition of the pit, led, although it had been announced long beforehand, to a sort of O. P. riot in little, on the first night of the new management. A certain number of people who according to some historians were "roughs," according to others old or elderly gentlemen addicted to playgoing, took up a position in the "second circle," which is the substitute for the old pit, and from that position expressed their dissatisfaction with the change that had been made. Mr. Bancroft, as he perhaps could hardly help doing under the circumstances, came forward to repeat an explanation which had been for some months before the p

in the course of which "a voice" replied to his remark that "a theatre is a place of business," "Not at all—it's a place of pleasure!" —and after a certain amount of tumult, the disturbers graciously consented to allow the play to go on.

The affair has been variously commented on by various writers. Some are of opinion that the people who made the disturbance should have been promptly expelled, a course which might possibly have caused yet more disturbance; and some appear to sympathize to a certain extent with the indignant pittites. The matter is a tolerably simple one. It is obvious that in the days of open theatrical competition a manager has a perfect right to arrange his theatre exactly as he likes at his own risk; and it is also obvious that any part of the playgoing public has a right to be dissatisfied with his arrangements. But it does not seem to us that they have any right, having procured certain places, to make an outcry in the form of a public disturbance because certain other places do not exist. Mr. Bancroft could hardly hope to do any good by meeting unreason with reason; and it is only to be regretted that in the excitement of the moment he did himself less than justice by putting himself forward in the character merely of "a business man." Of course every theatrical manager, and every one who follows the fine arts as a profession, is a business man; but there is something in art beyond business, and Mr. Bancroft has himself frequently proved that he is conscious of this.

The selection of *Money* as a fit play with which to open a new campaign at the Haymarket has been a good deal canvassed. There are, no doubt, certain obvious objections to it. The play is in its form, if not in its essence, distinctly old-fashioned, and the attempt to bring it down to the present day by putting it into modern costumes and substituting modern for old-fashioned allusions, is, from an artistic point of view, unfortunate, as it leads to many incongruities. Take, for instance, the Club scene. This, to begin with, is not strictly plausible. It is not eminently likely that two people bent on playing piquet for heavy stakes should choose to play their game in a room devoted to purposes of general conversation. This, however, is necessary for the action of the piece, and a reference to the inconvenience of the method adopted is put into the mouth of the hero, Evelyn, at the end of the scene. But it is hardly wise to exaggerate what air of improbability already exists by representing a room filled with people coming, going, talking with much volubility, smoking, and taking snuff. On the other hand, no doubt Mr. Bancroft's arrangement of the scene gives it considerable liveliness, and if one can tolerate the inconsistency of people costumed in the present fashion adopting the language and manners of Lord Lytton's play, one may perhaps also contemplate with equanimity the spectacle of a large Club which is the chosen haunt of all sorts and conditions of Club-men, and which apparently has only one room for all purposes, except those of dining and consulting books. For the rest, granted that the original and imported inconsistencies of the play can be put up with, it will be found that *Money* is admirably arranged for stage effect, and that it has a quality possessed by an unfortunately small proportion of modern pieces, and generally known as "backbone." The dialogue is in sentimental passages, as has frequently been pointed out, stilted, as Lord Lytton's dialogue of this kind in plays and novels always was; but it has at least more meaning and purpose than a good deal of modern dialogue has; and in the lighter passages it scarcely ever fails to amuse. The characters are types—their colours, to use a metaphor, are laid on with a good fat brush—but they are in most cases well managed and telling. A striking exception is unfortunately found in the part of the hero, Alfred Evelyn, out of which even Macready could get little that gave him any satisfaction. The intrigue upon which the play turns is managed so skilfully that its interest suffers comparatively little from its secret being known to the spectator.

It would appear from the criticisms published that the performance of the piece on the first night of the new management at the Haymarket suffered, not unnaturally, from the effect produced both on the actors and the audience by the disturbance at the beginning of the evening. On a subsequent night, however, the play went as smoothly and briskly as could be desired, and it seems to us to be, on the whole, remarkably well acted. We have spoken above of the difficulties of the impossible part of Evelyn. Considering these, Mr. Conway is decidedly to be congratulated on his performance of it. In pathetic passages he wants reality, but then the pathetic passages are just the least real ones of the part. It is much that he manages to play the part with dignity, and to avoid the air of priggishness which it cannot be easy to banish from it. Mr. Bancroft repeats his successful performance of Sir Frederick Blount. His manner and tone are excellent, but he might with great advantage be somewhat less familiar in his scene of flirtation with Clara Douglas. Clara Douglas is an insipid heroine enough, but Miss Marion Terry succeeds in giving her life and attractiveness. Mrs. Bancroft's performance of Lady Franklin can hardly be too highly praised. She seems to command gaiety at will, and, in a scene which might well verge on farce, preserves throughout the true spirit of comedy. This scene —the one in which Lady Franklin carries out her intention of making the melancholy Graves laugh, sing, and dance—is admirably played both by Mrs. Bancroft and Mr. Arthur Cecil, whose performance of Graves seems to us a singularly well studied and finely executed piece of acting. His facial expression, his voice, and his walk are all admirably in keeping with the character, and he has the art of never seeming to strain at the points which he makes. Mr. Odell's performance of Sir John Vesey has not been received with general favour. It is a new reading and an immensely amusing one of the part. We cannot find in the text any reason for supposing that Sir John was necessarily a person different from the one whom Mr. Odell has invented; but no doubt an actor who undertakes a part which is more or less associated with old traditions must expect to excite some disapproval if he ventures to strike out a new line. It might certainly be reasonable to make Sir John Vesey either more unctuous or more courtly, or both, than Mr. Odell makes him; but it is not in the nature of things unreasonable to make of him the somewhat odd and excessively entertaining figure which Mr. Odell presents to his audience. Probably no actor could do better justice to the part of Deadly Smooth than Mr. Archer, who played it when the piece was performed some years ago under the management of Mr. and Mrs. Bancroft at the Prince of Wales's Theatre. Miss Diets has a somewhat thankless part, which she plays very well, in Georgina Vesey. The smaller characters are excellently filled. Mr. Kemble's Stout is full of humorous touches, among which may be noticed the very permissible "gag" of constantly addressing Glossmore as "my lord," although it is in direct contradiction to one passage in the text. Mr. Forbes-Robertson, one of the most versatile and accomplished of young actors, displays, as might be expected, invention in the part of Glossmore. Mr. Vollaire brings his experience with great effect to bear on the part of the Old Member. Mr. C. Brookfield, who, we believe, makes his first appearance on the London stage in this piece, plays Sharp the lawyer with a remarkable air of reality, and his by-play, without being in the least obtrusive, is excellent. His elocution and his assumption of the manner of the family lawyer of comedy are alike excellent. A word of praise must also be given to Mr. Stewart Dawson for his performance of the Scotch builder MacStucco, and also, if we are not mistaken, of an unnamed personage in the Club scene who suggests the idea of a half-pay officer.

On the whole, the new managers are, it seems to us, to be congratulated on the success of their first venture. It was perhaps more prudent than dashing to open with a stock piece the representation of which involves such inconsistencies as those we have pointed out. But probably Mr. Bancroft is a better judge of such a matter, as of the expediency of doing away with the Haymarket pit, than any layman can be. The new management starts, at any rate, with an admirably arranged theatre and with an excellent company.

REVIEWS.

GREEN'S SHORT GEOGRAPHY.*

READERS of Miss Austen will remember that when Fanny Price came to stay with her grand relations at Mansfield Park, her cousins the Miss Bertrams at once discovered that her education had been lamentably deficient. "Dear mamma, only think, my cousin cannot put the map of Europe together—or my cousin cannot tell the principal rivers in Russia—or she never heard of Asia Minor. . . . Did you ever hear anything so stupid?" And at last came the culminating instance of ignorance. "Do you know, we asked her last night, which way she would go to get to Ireland; and she said, she should cross to the Isle of Wight." Now the Miss Bertrams, who, as they boasted, could repeat the chronological order of the Kings of England, and of the Roman Emperors as low as Severus, "besides a great deal of the heathen mythology, and all the metals, semi-metals, planets, and distinguished philosophers," had evidently been taught geography on the system which it is Mr. and Mrs. Green's mission to destroy. Had Fanny Price enjoyed the advantage of reading the preface to this work, she might, supposing that she could so far have done violence to her gentle nature, have thrown her cousins' lesson-books aside with scorn, and crushed the young ladies with Mr. Green's dictum:—"Books such as these, if books they must be called, are simply appeals to the memory; they are handbooks of mnemonics, but they are in no sense handbooks of Geography." Fanny herself, on the other hand, was in a condition favourable for the reception of Mr. Green's teaching. If she was hazy in the extreme as to the position of Ireland, she, having lived at Portsmouth, had at least a clear conception of the Isle of Wight. To that small extent, the picture of the earth in which she lived—we are quoting from Mr. Green's description of the objects to be aimed at by the teacher of geography—had grown into distinctness before her. So far at least she had a notion "of the distribution of land and sea."

It is a question whether there is not after all something to be said for the barbarous system on which the Miss Bertrams were educated. At any rate, the pupil laid up a store of possibly useful facts ready to hand. A knowledge of the multiplication-table may not expand the mind, but it is practically useful in many emergencies of life. However, we need not now discuss this subject. We will let Mr. Green speak for himself as to the defects of the existing "handbooks of mnemonics," which "are in no sense handbooks of Geography," and as to the aims of his own system. His opening and rather strong assertion seems to be founded upon some reminiscence of the ancient joke about the criminal who had

* *A Short Geography of the British Islands.* By John Richard Green, M.A., LL.D., Honorary Fellow of Jesus College, Oxford, and Alice Stopford Green. With Maps. London: Macmillan & Co. 1879.

his choice between Guicciardini and the galleys; or, to give the jest in its latest American dress, between a rope and the nearest tree on the one hand, and the obligation of becoming a member of a new *Pinafore* company on the other:—

No drearier task can be set for the worst of criminals than that of studying a set of geographical text-books such as the children in our schools are doomed to use. Pages of "tables," "tables" of heights and "tables" of areas, "tables" of mountains and "tables" of table-lands, "tables" of numerals which look like arithmetical problems, but are really statements of population: these, arranged in an alphabetical order or disorder, form the only breaks in a chaotic mass of what are amusingly styled "geographical facts," which turn out simply to be names, names of rivers and names of hills, names of counties and names of towns, a mass barely brought into grammatical shape by the needful verbs and substantives, and dotted over with isolated phrases about mining here and cotton-spinning there, which pass for Industrial Geography.

From this dreary picture we turn to consider what geography really is—"'earth-picturing,' a presentment of earth or a portion of earth's surface in its actual form, and an indication of the influence which that form has exerted on human history or human society." Although it is rather long, we cannot forbear to quote the passage in which Mr. Green unfolds his idea of the way in which geography should be taught—the way in which it will be taught "when the prejudices and traditions of our schools and schoolmasters have passed away." For how many centuries, we wonder, have educational reformers been raging against "the prejudices and traditions" of schoolmasters, and looking forward to the bright time when every boy will be educated on really scientific principles? Do not we all know the ideal boy (of fiction)—Gargantua, Télémaque, Master Tommy Merton, and a host more—who is only waiting for the ideal Ponocrates, Mentor, or Mr. Barlow to come and develop him into the full-blown ideal educational product. However, Mr. Green's discourse on the manner in which the study of geography should be approached is not the less interesting and instructive because he presupposes a child with an exceptional thirst for information:—

The starting-point of education will be the child's first question. And the child's first question is about the material world in which it finds itself. So long as every sight and every sound is an object of wonder, and of the curiosity that comes of wonder, life will be a mere string of "whats" and "whys." With an amusing belief in the omniscience of his elders, the child asks why the moon changes and what are the stars, why the river runs and where the road goes to, why the hills are so high and what is beyond them. To answer these questions as they should be answered is to teach the little questioner Geography. Each of the divisions into which Geography breaks does its part in his training, as the picture of the earth in which he lives grows into distinctness before him. He may never hear of Physiography, but he learns in simple outline what are the forces that tell through heat and cold or wind or rain on the form of the earth, and make it the earth we see. The name of Physical Geography may never reach him, but he gets a notion of what the earth's form actually is, of the distribution of land and sea, of mountain and plain over its surface, of the relative position of continents and of countries, of the "why" rivers run, and the "where" roads run to. As the structure of the world thus becomes distinct to the child he sees why races have settled, why nations lie within their boundaries, why armies have marched and battles have been fought, why commerce has taken one road or another over sea and land, and thus gathers his Historical Geography without knowing it. So as he watches how mountains divide men or rivers draw them together, how hill-line and water-parting become bounds of province and shire, how the town grows up by the stream and the port by the harbour-mouth, the boy lays the foundation of his Political Geography, though he never sees a "table of counties," or learns by rote a "list of populations."

It must not be rashly concluded that Mr. Green has sworn an eternal hostility to tables of counties and lists of populations. On the contrary, his own book contains such tables—lists of counties, county towns, areas in square miles, population, heights of mountains, and so forth. These, we suppose, are as the tithes of mint and cummin, which should not be neglected, although the weightier matters of the law should be first regarded.

We must not linger on Mr. Green's educational dream—for a dream, he admits, it will long remain—in which geography is to "furnish a ground-work for all after instruction"—history, politics, physical science, and language. "It is at any rate such a dream as this that has encouraged its writers to attempt the present book." It will be noted that the names of two authors appear on the title-page. Both writers, Mr. Green tells us, are responsible for the general plan, and for that part of the work which relates to England. The rest—Wales, Scotland, and Ireland—is due to Mrs. Green. With this information, we turn from the preface, which will by teachers be found interesting, and doubtless by pupils too, inasmuch as children are always entertained by knowing what the grown-up world thinks about them. It is, we doubt not, a necessary feature of that "rational system of primary education" to which Mr. Green looks forward, that school-books should be put into "æsthetic" bindings. This one appears in the sweet blue-grey tint which we associate with handbooks on artistic dress and furniture, and is embellished, outside with conventional representations of sky, earth, and sea, savouring strongly of the Renaissance period. The little Cimabue Browns, whose acquaintance we have had the pleasure of making through Mr. Du Maurier, no doubt have all their lesson-books bound in this style. It is possible that this helps to smooth the thorny path of learning; perhaps to the æsthetic infant even a black draught would lose some of its horrors if it was administered in choice blue china or Old Chelsea. We would however suggest to binders and publishers that, when a book is of itself sufficiently thick, there is no excuse for fattening it by sticking in at the end a catalogue fifty-six pages long.

For the general plan of the work we have nothing but praise. The introductory chapter, especially the sections on "Political Geography" and the "General Results of the Character of the British Group," is excellent, and ought to be read not only as an introduction to the study of geography, but to that of history also. We extract one paragraph, as a specimen of the manner in which the subject is treated:—

The strip of sea which runs between the British Isles and the Continent has greatly influenced *the progress of their inhabitants from barbarism to civilization*. Though foreign conquerors have in early ages been able to cross over the sea to Britain; the English Channel and the North Sea have long formed a barrier broad enough to prevent perpetual invasion and disquiet from without, and to give such a measure of security as was needed for the well-being of the British peoples. But on the other hand these seas have not been wide enough to shut out the civilizing influences of Europe; foreign trade, and wealth, and knowledge have been within easy reach of its people. And in some cases the channel which parts these islands from Europe has even invited civilization to their shores. It has made them a safe place of shelter for men driven out from their own lands by poverty, by misgovernment, or by persecution, and wave after wave of immigrants have thus been brought to our coasts, who have carried with them a knowledge of arts and manufactures.

After this chapter we pass to a "General View of England and Wales," and thence are led on to a more detailed survey, divided under the heads of "The Coast," "The Mountain Groups," "The Upland Ranges," "The Plains," "The River System," "The English Counties." The counties again are divided into groups, as "The Counties of the Severn Basin," "The Counties of the Humber Basin," and so on. Scotland is treated on a similar system; Ireland and Wales have to content themselves with two chapters apiece. We should add that there are four good coloured maps, besides twenty-four plain ones. The authors have shown great skill in carrying out their aims. The main features of the country are not lost sight of in a crowd of details. The book is not a gazetteer or a Postal Guide; but no intelligent child could read it without acquiring a clear idea of the form and make of the British Isles, and of the reasons why the life of one district differs from the life of another. "We must learn," the writers tell their pupil,

to know the actual surface of Southern Britain—where it is broken by rocky mountains, where its rivers have formed valleys rich with corn and fruits, and where its broad uplands furnish pastures for flocks. Nor is any of this knowledge useless. We get to understand the true importance of these facts as we watch how from age to age the inexorable lie of the land has compelled very different races and generations of men to live and build their cities by the same rivers in sheltered valleys or in fertile plains; to till the ground in the same fruitful districts; to make their roads along the same lines marked out by nature, sometimes across level plains, sometimes threading narrow valleys between the hills, now turning aside to reach some river-ford, and then rising over a mountain pass where the line of hills dips so as to form a gap in the forbidding heights. We learn why it is that the great English roads are as old as the earliest times told of by any history of England, and why so many towns and even villages have a story that goes back to the first beginnings of our people. And many things hard to understand in history become easy as we know the outer circumstances which led to the events of which we read.

Though we are compelled to observe that the phrase "inexorable lie of the land" is very little better than nonsense—we could hardly tolerate it in a novel—this is otherwise a good description of the aim of the work, and a good specimen of the way in which the authors relieve their subjects by the use of that picturesque style of which Mr. Green is a master. As examples of this descriptive power, we may also call attention to two passages in the part of the work assigned to Mrs. Green—the paragraph at p. 260 on the "Western Watershed" (Scotland), and that at p. 271 in which the Lowland are contrasted with the Highland Hills. These are specimens of pure "word-painting." As illustrations of the method in which the authors endeavour to call forth the thought and intelligence of the pupil, we refer our readers to the passage at p. 92 on the causes of the greatness of London, or that on the importance of rivers to the welfare of a country. The statement that "England is remarkable for the perfection of its river system" gives one a pang as one reflects how shamefully we have poisoned that river system, and how near we are to finding ourselves in the position of "not a drop to drink."

Points of detail of course may be found open to criticism. Such a hard word as "escarpment," which Latham's Dictionary knows only as a military, not as a geographical term, should not have been used before its explanation had been given. "Estuary" too might with advantage have been explained. We do not well understand what is meant by saying of Wales "The moors are studded with small tarns *instead of* lakes." What is a tarn but a mountain lake? Questions of spelling we approach with fear and trembling, never knowing what may be the last official or scientific dictum on the subject; but surely the mountain set down at p. 55 by the name of "Great Gavel" used to be called "Great Gable." And it is confusing to find the hills of Skye termed the Coilin Mountains in one page and the Cuchullin Hills in another. "Knots of head-waters" strikes us as an unfortunate phrase; it would puzzle Michael Scott's fiend to tie water in knots. Among the manufacturing towns on the Mersey, Widnes, a place of recent and rapid growth, instituted—to describe it in a manner easily comprehensible by the non-technical mind—for the production of noxious vapours, should not have been omitted. One word more; it is no part of the business of a geographer to pay compliments to one class more than to another. We find our authors dividing England as it were into sheep and goats, thus:—

To the west and north-west of the range, therefore, lie the whole industrial wealth and activity of England, its centres of dense population, and

its commercial cities, inhabited chiefly by intelligent and trained artisans, classes of rising importance in English political and social life. To the south-east of the range, on the contrary, are the agricultural districts of England, containing but one great centre of crowded population in the valley of the Thames.

Mr. Green ought to be aware that the Intelligent Artisan has become a bore. We are as weary of him and his intelligence as we used to be of the virtues of the Great Middle Class. Enthusiasm for industrial centres and commercial cities is apt to be a little damped by reflections upon the extent to which the inhabitants of some at least of them are addicted to drinking, kicking, and violent assaults in general. Why moreover are the school-children of the agricultural districts to be insulted by the implied disadvantageous comparison, pointed by a significant "on the contrary," with the rising generation of intelligent artisans on the favoured side of "the oolitic range"?

That this book will be extensively used, even on the wrong side of the range, we fully anticipate, and we welcome it as an effort—to our mind a successful one—to give life and meaning to a study which children in general find dry and unattractive. The ultimate decision on which the success of a school-book depends must rest with those engaged in the actual work of educating; but we believe that their verdict will be in its favour.

METRICAL TRANSLATIONS FROM SANSKRIT.*

DR. MUIR, the Nestor of Sanskrit learning, has here brought together in one volume his many fragmentary translations in verse from Sanskrit writers. A few years ago he published a small volume of "Religious and Moral Sentiments metrically rendered from Sanskrit"; but these have been greatly added to and extended, and the result is the handsome volume before us. So long since as 1831 Dr. Muir put forth the first part of his *Christa Sangita*, or Life of Christ in Sanskrit verse. After completing this work, which excited much curiosity and gained considerable favour among learned Hindus, he followed it up with a *Life of St. Paul*. Then he published a work called *Mata pariksha*, or Examination of Religions, which set forth a sketch of the argument for Christianity and combated some of the leading points of Hinduism. These were all composed in verse—in the form most familiar to Brahmans, and therefore most likely to attract their attention. The last of them excited so much interest as to call forth some replies. All of these have been reproduced in the vernacular languages, and they are among the most useful and potent vehicles for the dissemination of Christianity. The time which could be spared from official duties in India was spent by Dr. Muir in the endeavour to bring a knowledge of Christianity to Hindus. In his retirement at home he has been engaged in unfolding the mysteries of Hinduism to Europeans, and his volumes of extracts from Sanskrit texts have thrown a flood of light upon the obscure subjects treated of in the old Hindu writings. These books were for the use of the few—for philosophers and the students of Hinduism—but the present work deserves to have, and will no doubt find, a large and various body of readers.

The translations are generally short and of a religious, moral, and didactic character. The versification is smooth and easy, the language clear and intelligible. No special knowledge is required to understand them. New ideas will be occasionally met with, but more frequently old and familiar ones, presented in new lights and with unfamiliar surroundings. The latter part of the volume contains a series of sketches of the different Vedic deities as they appear in the hymns of the Rig Veda. These are made up of passages culled and brought together from different hymns. They give a very clear outline of the chief attributes of the principal deities, and from no source could the ordinary reader obtain a more adequate and accurate conception of the gods of the old Aryas. One prominent feature in the addresses to the deities is the familiar and friendly way in which they are addressed, and another is the very material and mundane character of the promises made to them. Indra, the god of the sky, is thus addressed:—

Friend Indra, from the sky descend,
Thy course propitious hither bend;
Come straight, and let no rival priest
Prevail to draw thee from our feast.
Let no one catch thee unawares,
Like bird the artful fowler snares.
All is prepared; the soma draught
Is sweet as thou hast ever quaffed;
And we will feed with corn, and tend,
Thy coursers at their journey's end.

Some men may perhaps think that they have heard enough of late of *Ushas*, the Dawn; but if others wish to become acquainted with this beautiful myth, they will in this volume find it described in very graceful flowing verse. Two stanzas descriptive of one of the attributes of Varuna (Οὐρανός), the "all-pervader," we will quote:—

This mighty lord who rules on high,
Though closely veiled from mortal gaze,
All men's most secret acts surveys,
He, ever far, is ever nigh.
* * * *
He marks the good and ill within
The hearts of men; the false and true
Discerns with never-erring view;
He hates deceit, chastises sin.

The above, as we have said, are not strictly translations, but compositions made up from the language of different hymns. But the greater part of the volume is given to translations, as close and true as the nature of the two languages and the trammels of verse will allow. Where there is any material deviation from the original text the author gives an exact prose translation. Very many of the extracts are derived from the great epic poem the "Mahá-Bhárata." One of these is an eloquent impeachment and vindication of the divine government. Draupadi, the heroine, stirred by the wrongs and sufferings of her husband, exclaims:—

I charge the Lord of all—the strong,
The partial Lord—with doing wrong.
* * * *
God does not show for all mankind
A parent's love and wise concern;
But acts like one unfeeling, stern,
Whose eyes caprice and passion blind.

Her husband gently chides her, and expatiates on duty, and on the necessity of performing it for its own sake, not for any hope or prospect of reward. He then says:—

Of all the men who care profess
For virtue—love of that to speak—
The unworthiest far are those who seek
To make a gain of righteousness.

Who thus—to every lofty sense
Of duty dead—from each good act
Its full return would fain extract;—
He forfeits every recompense.

And upon the inscrutable workings of Providence he goes on:—

The gods—for such their sovereign will—
Have veiled from our too curious ken
The laws by which the deeds of men
Are recompensed with good and ill.

No common mortal comprehends
The wondrous power, mysterious skill,
With which these lords of all fulfil
Their high designs, their hidden ends.

We frequently come across striking parallels of Gospel teaching, of which we shall have a little to say anon, thus:—

Shall He to thee support refuse,
Who clothes the swan in dazzling white,
Who robes in green the parrot bright,
The peacock decks in rainbow hues?

Again,

Wealth either leaves a man, O king!
Or else a man his wealth must leave.
What sage for that event will grieve,
Which time at length must surely bring?

What an elevated idea of true worship is expressed in the following verse from the Bhágavata Purána—

To scatter joy throughout thy whole
Surrounding world; to still men's grief;
Such is the worship best and chief
Of God, the Universal Soul—

and how much in unison with Coleridge's "He prayeth best who loveth best." The following, too, strikes a chord which Scott has struck with bolder hand:—

Not such is even the bliss of heaven
As that which fills the breast of men,
To whom, long absent, now 'tis given
Their country once to see again,
Their childhood's home, their natal place,
However poor, or mean, or base.

We have made copious quotations because it is nearly impossible to give any fair notion of such a book as this in any other way. One more passage we will cite, notwithstanding the faulty rhyme of the last couplet—

The wound a foeman's trenchant steel
Inflicts, in time again will heal;
The tree a woodman's axe o'erthrows
Soon sprouts again, and freshly grows;
But never more those wounds are closed,
Which harsh and cutting words have caused.

The whole work, like the foregoing extracts, is strongly impressed with the pensive, reflective character of the Hindu mind, with thoughts about the joys and cares of this life, and the hopes and fears of that to come. There are a few passages of a martial character; but they are somewhat tame, and lack the spirit-stirring ring of Northern heroic songs.

In his Introduction Dr. Muir discusses a very interesting question, which we have reserved for the end of our notice, because some of the extracts quoted will help to the comprehension of it. There is, in the "Mahá-Bhárata," a long and very beautiful episode called the Bhagavad-gítá, the "Divine Song." This is pervaded by such an elevated tone of thought and Christian-like spirit, and contains passages so much in unison with Gospel texts, that it has been thought to have been written under Gospel influence. Dr. Lorinser, who has written strongly upon the subject, and whose arguments have stirred up much discussion, says:—

If we can find in the Bhagavad-gítá passages, and these 'not single and obscure, but numerous' and clear, which present a surprising similarity to passages in the New Testament, we shall be justified in concluding that these coincidences are no play of chance, but that taken altogether they

* *Metrical Translations from Sanskrit Writers, with an Introduction, Prose Versions, and Parallel Passages from Classical Authors.* By J. Muir, C.I.E., D.C.L., LL.D., Ph.D. London: Trübner & Co. 1879.

afford conclusive proof that the composer was acquainted with the writings of the New Testament, used them as he thought fit, and has woven into his own work numerous passages, if not word for word, yet preserving the meaning, and shaping it according to his Indian mode of thought.

Among the passages quoted by Dr. Lorinser from the Gítá are these. "They who devoutly worship me are in me and I in them." "Repose thy mind upon me, fix thine understanding and thou shalt hereafter dwell in me." "But if I were not constantly engaged *in work* unwearied . . . these worlds would perish *if I did not work my work.*" "I who am the highest *way.*" "I am the way, beginning, and end." There can be no doubt that these and many other passages in the Gítá are closely similar to the words of the New Testament. Are they, then, borrowed from the Gospel, or are they the independent workings of a Hindu mind? Dr. Lorinser and those who agree with him assume that the Bhagavad Gítá was written after the rise of Christianity; but this is very uncertain, and rests entirely upon inference. Some have come to the conclusion that it was written two or three centuries after Christ; others, who give reasons equally plausible for their view, maintain that it was produced two or three centuries before. The date, then, is of no avail in the argument, and the question has to be judged entirely upon internal evidence. Much has been written upon the subject, and the balance of opinion is against Dr. Lorinser's view. Professor Monier Williams, though he argues generally against it, still thinks that "something may be said for Dr. Lorinser's theory." Dr. Muir himself declines "offering any opinion on this intricate problem, but ventures to make the following remarks on the subject. "There is no doubt a general, or perhaps I might say, a striking, resemblance between the manner in which Krishna asserts his own divine nature, enjoins devotion to his person, and sets forth the blessings which will result to his votaries from such worship, on the one hand, and, on the other, the strain in which the Founder of Christianity is represented in the Gospels, and especially in the Fourth, as speaking of himself and his claims, and the redemption which will follow on their faithful recognition. At the same time, the Bhagavad Gítá contains much which is exclusively Indian in its character, and which finds no counterpart in the New Testament doctrine." While Dr. Muir thus leaves the question open, he has provided in an Appendix considerable helps towards the formation of a judgment. He quotes from classical writers passages breathing the same spirit and often closely resembling in expression the Sanskrit extracts which he has translated. Thus Manu says:—

Our virtue is the only friend
That follows us in death;
All other ties and friendships end
With our departing breath.

And Sophocles, as translated by Professor Campbell:—

For our great Father counteth piety
Far above all. This follows men in death
And faileth not when they resign their breath.

This volume represents the best side of Hindu literature; it is "a collection of some of the best sentiments which are to be found in Sanskrit writers," and is far from being a fair specimen of its general tone and character. There is much in Hindu literature which is repugnant to European morality and sentiment; the good and the bad, the pure and the impure, the noble and the ignoble, are mixed, sometimes alas, in very unequal proportions; but the literature which can supply such a volume of Elegant Extracts as this before us deserves the attentive consideration and study of philosophers and moralists. "Are not," asks Dr. Muir, "the literatures, whether sacred or profane, of all countries, more or less disfigured by something repugnant to the moral sense?"

The misquotation—

When pain and anguish wring the brow,
A veritable angel thou—

must be noted as remarkable in a Scotchman and a poet.

PATTISON'S MILTON.*

MR. MARK PATTISON and the editor of *English Men of Letters* ought to know best about the general aim of the series of biographies which they have successively enriched with their own most interesting contributions. According to Mr. Pattison, his "outline" is intended for those readers "who cannot afford to know more of Milton than can be told in some two hundred and fifty pages." If so, the more affluent section of the public is to be congratulated upon its accidental good fortune; for, though the Rector of Lincoln might undertake a biography for the needy, no production from his hand was likely to assume a flavour of the literary soup-kitchen, still less (if we may use his own phraseology) to "stupefy instead of training the faculties by the rapid inculcation of unassimilated information." On the contrary, we are happy to say that he has never been more himself than in this essay, and has accordingly never been more enjoyable. It is only in the very last sentence of the book that he seems to us to approach shallow water; for if it was necessary by way of a final flourish to introduce Shakspeare and Milton—"Shakspeare first and next Milton"—as those by whom "we shall choose to be represented at the international congress of world poets," it was unfortunate so to couple them in contrast with authors who are our "favourite closet companions." But, in general, this little work, full without overflowing its fixed limits, and of real value as a fresh and vigorous criticism, has the peculiar charm of its author's favourite ironical manner. And it is hardly necessary to add that in a sketch of Milton's life Mr. Pattison finds many opportunities for employing his favourite manner in the service of his favourite antipathies. There is an unmistakable twinkle in the seriousness of such passages as the following, all of which are quite legitimately suggested by their context:—

And in Universities generally it is not literature or general acquirements which recommend a candidate for endowed posts, but technical skill in the prescribed exercises and a pedagogic intention. . . .

In virtue of the grandeur of zeal which inspires them, these pages, which are in substance nothing more than the now familiar omniscient examiner's programme, retain a place as one of our classics. . . .

In those infamous productions, hatched by celibate pedants in the foul atmosphere of the Jesuit colleges, the gamut of charges always ranges from bad grammar to unnatural crime. . . .

It is only to be regretted that a writer at once so grave and so witty should not both give himself the trouble of avoiding an occasional looseness of syntax which it is impossible to suppose intentional, and spare himself that of occasionally using a vocabulary which is manifestly such. "Battailous" is of course a loan, and a very happy one, from Milton's own verse, and, for all we know, "traditive" and "insititious" may occur among Milton's contributions to the "digladiations" of his age; nor would we assert in a witness-box that he nowhere in his prose uses "truant" as a verb. But in a writer of the present day the choice of such words smacks just a little of affectation—a fault unfortunately common enough in masters of style, but not more praiseworthy in them than in their inferiors.

In any case, these trifles have but a feather's weight against the real merits of this admirable essay. If among these merits we are inclined to rank first the recognition of that which gives unity to Milton's life viewed as a whole, it is not because we are able to accept Mr. Pattison's view altogether, but because we are convinced that he has chosen the only admissible standpoint. Milton, born to be a poet, trained himself to become such at first unconsciously, then more and more with a sense of the work, the duty, incumbent upon him. Occasional inevitable impulses of impatience apart, he adhered to his plan of life—of which he was neither weary nor ashamed—through long years of self-preparation, and even through the sustained interruption which absorbed nearly a third of his existence and all the best years of his manhood. This plan was that of perfecting himself, in the first instance, for becoming a great English poet; in the second, for executing a particular great poetical work in his native tongue. Perhaps none of our great poets has aimed so definitely, prepared so fully, achieved so completely. This cardinal fact, which is sufficient to entitle Milton to undisputed possession of the place occupied by him in our national House of Fame, has never been more clearly and convincingly demonstrated than by Mr. Pattison. He shows, not merely (which required no showing) that *Comus* and its companion pieces were, "when produced, as they remain to this day, the finest flower of English poesy," but also that Milton regarded them "only as firstfruits, an earnest of greater things to come." He reminds us how, though "*Paradise Lost* was *composed* after fifty, it was *conceived* at thirty-two"; and he suggests how, even after the accomplishment of his great work, Milton, in *Paradise Regained*, applied to his genius a yet stricter and more conscientious artistic discipline. From this point of view, which we believe to be the true one, Mr. Pattison has consistently and effectively treated "the first Englishman of whom the designation of our series, *Men of Letters*, is appropriate." Milton, he continues,

was also the noblest example of the type. He cultivated not letters, but himself, and sought to enter into possession of his own mental kingdom, not that he might reign there, but that he might royally use its resources in building up a work which should bring honour to his country and his native tongue.

It is of course by no means necessary, because we are of opinion that Mr. Pattison has found the true key to a just appreciation of Milton's life and mind, that we should subscribe to all the deductions which we are asked to accept in addition. Mr. Pattison clearly regards Milton as having not only prostituted his powers, but wasted his time to boot, in his protracted deviation from the course which the promptings of his own inspiration had clearly marked out for him. In the course of his observations tending to this result, Mr. Pattison undoubtedly brings out some plain facts which it is useless to attempt to overlook. That in his pamphlets on Divorce Milton should have sought a general, not a personal, remedy for his own grievance, in one sense shows the breadth and grandeur of his mind; but at the same time his pleadings are hopelessly damaged by the circumstance that the general change was so speedily (if Mr. Masson's discovery of the earlier date of the first Divorce tract be correct, so instantaneously) urged as a remedy for a personal wrong. Again, Milton's theological writings may be deficient in that which to the controversies of theology, as an essentially historical science, is indispensable—a full and even a competent knowledge of the learning of the subjects discussed. When, however, in speaking of Milton's political pamphlets, Mr. Pattison calls upon us to note that these productions, "now only serving as a record of the prostitution of genius to political party, were, at the time at which they appeared, of no use to the cause in which they were written," we demur to both the assertions contained in the sentence. In the first place, are we to be told (as Mr. Pattison tells us again and again) of what the Puritan revolution was to England and to Milton, and almost

* *Milton.* By Mark Pattison, B.D., Rector of Lincoln College, Oxford. English Men of Letters Series. London: Macmillan & Co. 1879.

in the same breath to be asked to treat his self-sacrifice to its cause as a surrender of himself "to political party"? In the second place, it seems to us a mere begging of the question to assert (what for that matter we should be slow to allow) that Milton's pamphlets were useless *at the time*. For it may be worth a man's while to become the mouthpiece of a cause, a principle, or a policy, without the hope of producing an immediate effect. Ministers thought one of Burke's greatest Indian speeches unworthy of notice; but it was not on that account a waste of breath. And, to take very much lower ground, is Mr. Pattison prepared to deny that the *Pro Populo Anglicano Defensio*, for instance, sufficiently answered its immediate purpose as a controversial countermove to the *Defensio Regia?* Moreover, though we would willingly go any length in condemning the unworthiness of much in the *Defensio Secunda*, was it not, as a matter of policy at all events, worth while to have the greatest scholar in Europe and his champion answered after a fashion which showed that, as there was no flinching on the part of England's rulers, so they were not without an advocate whose execution of his task made "all Europe ring from side to side?" For it surely was no vain boast in which Milton indulged when he used these words in his famous sonnet. Again, Mr. Pattison takes a very different view from Professor Masson in holding Cromwell to have left Milton (who was after all only a novice in political life) unconsulted on affairs of great importance. But, even were we to accept Mr. Pattison's opinion on this head, it would be useless to speculate on Cromwell's reasons when we know virtually nothing of the personal relations between the two. At all events it is difficult to reconcile the belief that Milton was generally neglected by the leading politicians of the Protectorate with the tradition that he was allowed by the Protector, as he had previously been by the Parliament, "a weekly table for the entertainment of foreign ministers and persons of learning"—which certainly looks as if he had been put forward as what he really was, the literary representative of the Government. To the phrase quoted by Mr. Pattison from Milton's letter to Peter Heimbach in 1657 we should be inclined to attach little weight; but in any case it seems going too far, considering the undeniable notoriety of some of Milton's political writings, to attribute the leniency shown to him after the Restoration to his "insignificance," as well as to his "harmlessness." He could hardly have been regarded as insignificant by a *régime* which, like that of the Restoration, well understood the usefulness of penmanship. At the same time, Mr. Pattison as a matter of course rejects the incredible tradition which states an offer to have been made under Charles II. to continue Milton in his Latin Secretaryship. This story is only less absurd than that of his having died a Roman Catholic, a lively fiction exposed by Mr. Pattison, as it were, from Milton's own mouth.

The true reason, as it seems to us, which led Milton at any risk—whether of health and wealth, or of peace and full contentment of mind—to take up arms on behalf of the Puritan cause, was that "ideal force working in the minds of a few" upon which Mr. Pattison has so appropriately dwelt. Since of these few Milton felt himself one, no tendency to "aloofness" could prevent him from taking an active part in the conflict. He came to it slowly indeed (Mr. Pattison's irony is not at all out of place here), but surely, even from that Italian sojourn which had helped to reveal him to himself. The impulse may have often driven him astray, as it incontestably failed at all times to sustain his pursuit of his aim on a level with that aim itself. But this impulse was part of Milton's character, which, as Mr. Pattison justly says of Milton's mind, was an organic whole. For our part, we are convinced that, not in *Lycidas* only, but already in the earlier *Comus*, and possibly even in the contrast between *Il Penseroso* and *L'Allegro*, is to be discovered the movement of that crusading spirit (so to speak) which made it necessary for Milton to take service under the Commonwealth, and to become the official apologist of the Revolution.

This view of Milton's conduct of his life is, as a matter of course, absolutely independent of whatever judgment we may happen to have formed as to the Revolution and the Restoration themselves. Mr. Pattison could hardly avoid an indication, at least, of his own estimate of these great episodes of our national history, however warily he may tread. To his view of the Restoration as a transaction which swept away the heroic age of England by one fatal blast we can only modestly demur, even as he has modestly advanced it. If "it is for the historian to describe and unfold the sources of this contagion," it is likewise for the historian to distinguish between reaction and decline—two processes by no means so absolutely identical as they are at times assumed to be. And before we can accept, even in passing, the observation that "the Restoration was a moral catastrophe," we may require to be satisfied as to the point in the drama at which Mr. Pattison would place its climax. Meanwhile we have often felt that the treatment of Milton himself by the Restoration age has been very unjustly urged to its discredit. Mr. Pattison speaks of Dryden as a "distinguished exception" to the comparative neglect of Milton's poetic claims; and we may add that even in the preface to the *State of Innocence* Dryden betrays an instinctive recognition of what all critics have recognized as the most characteristic of Milton's poetic qualities. But it should at least be remembered that the subscription for the edition of 1688 revealed a readiness to acknowledge the claims of the Puritan poet, not only among favourite authors such as Dryden and Waller and Dorset, but even in the academical clique of the Christ Church wits. Mr. Pattison is doubtless right in saying that Milton's repute was the work of the Whigs, but it is curious that one of the earliest scholiasts upon Milton should have been Atterbury.

The more specifically literary criticism for which Mr. Pattison has found room within the narrow framework of this biographical essay is throughout discriminating without at all verging upon pettiness; and his observations on *Paradise Lost* in particular explain many of the distinctive features of a poem which has attracted a large number of critics in proportion to the number of its readers. Never exuberant in his praise, Mr. Pattison has, so far as we can observe, criticized Milton's prose style with justice, and his poetic style or styles with generous sympathy, leaving undetermined, though not unnoticed, the question whether the latter is not nearest to perfection in *Paradise Regained*. But on this point, and on other incidental topics of Miltonic criticism, we have left ourselves no space to dwell. We will therefore content ourselves with instancing the brief but conclusive demonstration of the critical opinion that Milton "sees nature through books, but still sees it"; and, on the other hand, with hinting a doubt as to the supposed danger lest "the possibility of epic illusion should be lost to the whole scheme and economy of" *Paradise Lost*. Milton is not even in this respect at the mercy of an academic public, though, without academic criticism such as Mr. Pattison's, Milton will never more than half disclose his beauty and his strength to the public at large. It is this which makes the essay before us hardly less valuable than it is enjoyable. We cannot part from it without expressing our gratification at the cordial tribute which it renders to Mr. Masson's great work, as "a noble and final monument erected to the poet's memory." The wreath which Mr. Pattison has laid beside this monument is no idle or ephemeral adjunct.

BARBARA.*

MISS BRADDON'S latest novel has gone through strange vicissitudes in the matter of its title. It was begun in the columns of a contemporary under the title of "Splendid Misery." Copyright in the title-words was asserted by the proprietor of a halfpenny weekly journal, in which was published, and in which lay buried for years, a short tale with the title 'Splendid Misery.' Under pressure of a suit in Chancery the novel was re-named '*Her* Splendid Misery'; but as this alteration did not satisfy the Court of Chancery, the title was again changed into 'Her Gilded Cage.'" Now in its completed form it is presented to the public under the name and style of *The Story of Barbara; Her Splendid Misery and Her Gilded Cage*, "in the belief that no one can take exception either to a mere Christian name, when used in the title of a novel, or to the trebly distinctive title now given to a book that was written to amuse the public, and not to exercise the copyright lawyers." It would be idle and out of place to comment upon what the Court has decided further than to say that such a decision as Miss Braddon complains of—there was another not very unlike it a few days ago—must seem extraordinarily vexatious to the lay mind. We cannot, however, but hope, if vainly, with her, "that the promised revision of the law of copyright will contain clauses to protect authors against the oppressive surprise of a Chancery suit over a forgotten or a disused title, and that some inexpensive court will be empowered to deal promptly and cheaply with such insignificant contentions." However, further consideration of these matters would take us too far away from the πολλῶν ὀνομάτων μορφὴ μία which Miss Braddon has given to the public.

There can, it seems to us, be little doubt that, whatever faults Miss Braddon may have had or may have as a writer—and such faults have often enough been pointed out in these columns—she must rank as one of the most dexterous of modern novelists. Her earlier novels—sensation novels, as they were called—displayed remarkable inventive and constructive skill; and the fact that more than one of them was turned readily into an effective stage play bears witness to their dramatic instinct. But there are very few writers whose inventive power seems to go on for an indefinite time. Gaboriau's power of designing new situations and complications appeared never to flag; but of course it might have flagged if he had lived longer. Miss Braddon has probably been judicious in not attempting to force her invention, but in trying rather to give a fresh turn and aspect to situations which are common to many works of higher, and to hundreds of lower, calibre than hers. When once we get out of the region of ingenious crime and ingenious detective analysis of it, we find indeed that there are only a certain number of events and emotions upon which a novel can be made to hang; and the success of a novelist who makes use of them is in proportion to the novelty of combination or aspect which he can give to them. Of course a comparatively slight novelty in arrangement is enough for a writer who seeks to attract more by his treatment of character than of event. It is Miss Braddon's merit that she has shown herself able to compose a novel which is at least not unamusing by dint of a simple enough combination of well-worn situations, and of taking more pains to make her characters like human beings than could be discovered in her earlier performances.

The *Story of Barbara* is, if baldly told, the old story of a loving

* *The Story of Barbara; her Splendid Misery and her Gilded Cage.* A Novel. By the Author of "Lady Audley's Secret," "Vixen," &c. 3 vols. London: John & Robert Maxwell.
